9. Housekeeping surfaces (e.g., floors, tabletops) will be cleaned on a regular basis, when spills occur, and when these surfaces are visibly soiled.
10. Environmental surfaces will be disinfected (or cleaned) on a regular basis (e.g., daily, three times per week) and when surfaces are visibly soiled.
11. Walls, blinds, and window curtains in resident areas will be cleaned when these surfaces are visibly contaminated or soiled.
12. Disinfecting (or detergent) solutions will be prepared as needed and replaced with fresh solution frequently (e.g., floor mopping solution will be replaced every three resident rooms, or changed no less often than at 60-minute intervals).
13. Mop heads and cleaning cloths will be decontaminated regularly (e.g., laundered and dried at least daily).
14. Horizontal surfaces will be wet dusted regularly (e.g., daily, three times per week) using clean cloths moistened with an EPA-registered hospital disinfectant (or detergent). The disinfectant (or detergent) will be prepared as recommended by the manufacturer.
15. Spills of blood and other potentially infectious materials will promptly be cleaned and decontaminated. Blood-contaminated items will be discarded in compliance with federal regulations (i.e., OSHA bloodborne pathogens standard).
16. The following procedures will be implemented for site decontamination of spills of blood or other potentially infectious materials (OPIM):
 - a. Use protective gloves and other PPE (e.g., when sharps are involved use forceps to pick up sharps and discard these items in a puncture-resistant container) appropriate for this task.
 - b. Disinfect areas contaminated with blood spills using an EPA-registered tuberculocidal agent, a registered germicide on the EPA lists D and E (i.e., products with specific label claims for HIV and HBV) or freshly diluted hypochlorite solution.
 - c. If sodium hypochlorite solutions are selected use a 1:100 dilution to decontaminate nonporous surfaces after a small spill (e.g., <10 mL) of either blood or OPIM.
 - d. If a spill involves large amounts (e.g., >10 mL) of blood or OPIM, or involves a culture spill in the laboratory, use a 1:10 dilution for the first application of hypochlorite solution before cleaning in order to reduce the risk of infection during the cleaning process in the event of a sharps injury.
 - e. Follow this decontamination process with a terminal disinfection, using a 1:100 dilution of sodium hypochlorite.
17. If the spill contains large amounts of blood or body fluids, the visible matter will be cleaned with disposable absorbent material, and the contaminated materials discarded in an appropriate, labeled container.

continues on next page

18. Protective gloves and other PPE appropriate for this task will be used.
19. In units with high rates of endemic *Clostridium difficile* infection or in an outbreak setting, dilute solutions of 5.25%–6.15% sodium hypochlorite (e.g., 1:10 dilution of household bleach) or an EPA registered antimicrobial product effective against *Clostridium difficile* spores will be used for routine environmental disinfection. If chlorine solution is not prepared fresh daily, it will be stored at room temperature for up to 30 days in a capped, opaque plastic bottle. (Note: A 50% reduction in chlorine concentration will occur by day 30.)
20. An EPA-registered sodium hypochlorite product is preferred, but if such products are not available, generic versions of sodium hypochlorite solutions (e.g., household chlorine bleach) may be used.

Cleaning and Disinfection of Resident-Care Items and Equipment

Policy Statement

Resident-care equipment, including reusable items and durable medical equipment will be cleaned and disinfected according to current CDC recommendations for disinfection and the OSHA bloodborne pathogens standard.

Policy Interpretation and Implementation

1. The following categories are used to distinguish the levels of sterilization/ disinfection necessary for items used in resident care:
 - a. **Critical items** consist of items that carry a high risk of infection if contaminated with any microorganism. Objects that enter sterile tissue (e.g., urinary catheters) or the vascular system (e.g., intravenous catheters) are considered critical items and must be sterile.
 - b. **Semi-critical items** consist of items that may come in contact with mucous membranes or non-intact skin (e.g., respiratory therapy equipment). Such devices should be free from all microorganisms, although small numbers of bacterial spores are permissible. (Note: Some items that may come in contact with non-intact skin for a brief period of time (e.g., hydrotherapy tanks, bed side rails) are usually considered non-critical surfaces and are disinfected with intermediate-level disinfectants.)
 - c. **Non-critical items** are those that come in contact with intact skin but not mucous membranes.
 - (1) Non-critical resident-care items include bedpans, blood pressure cuffs, crutches and computers.
 - (2) Most non-critical reusable items can be decontaminated where they are used (as opposed to being transported to a central processing location).
 - d. **Reusable items** are cleaned and disinfected or sterilized between residents (e.g., stethoscopes, durable medical equipment).
 - (1) **Single resident-use items** are cleaned/disinfected between uses by a single resident and disposed of afterwards (e.g., bedpans, urinals).
 - e. **Single-use items** are disposed of after a single use (e.g., thermometer probe covers).
 - f. **Reprocessed single-use devices** are those that have been previously used by a resident and then subjected to additional processing (manufacturing) for the purpose of an additional single use on another resident. Use of reprocessed single-use devices is permitted if:
 - (1) The device is reprocessed by a FDA-registered third party preprocessor; and
 - (2) There is documentation from the third party processor indicating that it has been cleared by the FDA to reprocess the device.
2. Critical and semi-critical items will be sterilized/disinfected in a central processing location and stored appropriately until use. Equipment to be processed will be labeled with at least the following information:
 - a. That the equipment is contaminated;
 - b. The address to which the equipment is to be shipped;
 - c. The address from which the equipment was removed (including telephone number);
 - d. The name of the person labeling the equipment; and
 - e. The date and time the label was affixed to the equipment.
3. Durable medical equipment (DME) must be cleaned and disinfected before reuse by another resident.
4. Reusable resident care equipment will be decontaminated and/or sterilized between residents according to manufacturers' instructions.

continues on next page

5. Only equipment that is designated reusable shall be used by more than one resident.
6. Single use items will be discarded after a single use.
7. Intermediate and low-level disinfectants for non-critical items include:
 - a. ethyl or isopropyl alcohol;
 - b. sodium hypochlorite (5.25-6.15% diluted 1:500 or per manufacturer’s instructions);
 - c. phenolic germicidal detergents;
 - d. iodophor germicidal detergents; and
 - e. quaternary ammonium germicidal detergents (low-level disinfection only).
8. High-level disinfectants/liquid chemical sterilants will not be used for disinfection of non-critical items.

Cleaning Spills or Splashes of Blood or Body Fluids

Policy Statement

Spills or splashes of blood or other body fluids must be cleaned and the spill or splash area decontaminated as soon as practical.

Policy Interpretation and Implementation

1. Whoever spills or splashes blood or body fluid, or witnesses splattered or spilled blood anywhere in the facility, shall notify environmental services that a spill or splash of blood or body fluids has occurred and shall provide pertinent information, including the amount and area in which the incident occurred.
2. An appropriately trained and authorized individual shall clean and disinfect any surfaces or equipment contaminated with spills or splashes of blood or body fluids as soon as practical to prevent exposure.
3. Whoever is exposed to blood or body fluids shall report the occurrence to the infection preventionist (or designee) and wash his/her hands as soon as practical after exposure.
4. Staff must wear gloves when cleaning spills or splashes of blood or body fluids. (Note: Other protective equipment, i.e., gowns, masks, and goggles, may be necessary if splashing of blood or body fluids into the eyes, nose, or mouth, or soiling of clothing is likely. Shoe coverings will be necessary if there is a large amount of blood or body fluids on the floor.)
5. Wash hands as soon as practical after exposure to blood or body fluids.
6. The facility has established procedures governing the cleaning and disinfection of spills or splashes of blood or body fluids.

Exposure Classification of Tasks/Procedures

Policy Statement

All tasks/procedures performed on the premises will be evaluated to determine the potential for exposure to bloodborne pathogens and other potentially infectious materials.

Policy Interpretation and Implementation

1. The infection preventionist (or designee), with the assistance of the medical director and other staff, shall be responsible to identify, evaluate, and classify each task/procedure performed on premises.
2. Task/procedure classification will include as a minimum:
 - a. identifying body fluids that are likely to be contaminated with the AIDS (HIV) and hepatitis B and C (HBV/HCV) viruses;
 - b. determining the amount of body fluids that staff are likely to encounter as a result of performing a procedure;
 - c. determining the probability of the employee being exposed to contaminated body fluids as a result of performing the procedure;
 - d. identifying the ways in which the AIDS (HIV) or hepatitis B and C (HBV/HCV) viruses could enter the employee's body as a result of performing the procedure;
 - e. identifying the protective equipment that should be used while performing the procedure; and
 - f. identifying work practices necessary to perform the procedure.
3. A *Standard Precautions Barrier Checklist* will be developed, based on the foregoing task/procedure classifications.
4. At least annually, and in conjunction with other staff and the administration, the infection preventionist (or designee) will re-evaluate the task/procedure classifications to determine if any task/procedure should be reclassified to a higher or lower risk category.
5. Department heads and staff will be included in the classification effort as well as to help identify engineering controls that may be useful in preventing potential exposure to blood, body fluids or other potentially infectious materials.

continues on next page

6. Inquiries concerning our facility’s classification system should be referred to the infection preventionist (or designee).

Exposure Determinations

Policy Statement

Job positions that require the performance of tasks involving potential exposure to blood or body fluids have been identified.

Policy Interpretation and Implementation

1. Each job position has been evaluated to determine if such position requires the performance of any duty that involves the exposure, and/or potential exposure, to blood or body fluids.
2. Job positions are reviewed annually by the infection preventionist to determine if changes in exposure determinations are necessary. Such changes are made as appropriate.
3. Each employee is required to read and sign a copy of his/her respective job description prior to or upon reporting for work.
4. Bloodborne pathogens in-service training is provided to employees who serve in positions in which occupational exposure is likely to occur. Such training will be provided prior to the employee performing the task.
5. Should a job position be modified to include tasks that could result in occupational exposure, an in-service training class relative to the hazards involved with such tasks will be conducted prior to the employee's performance of his/her new task assignments.
6. Job positions requiring the performance of such tasks are appropriately identified and reviewed with each employee prior to or upon employment. Job positions have been classified as follows:

Job Positions in Which Exposure to Blood/Body Fluids May Occur	
Advanced Practice Registered Nurse (APRN)	Head Cook/Chef
Activity Assistant	Housekeeper
Activity Consultant	Housekeeping Supervisor
Activity Director	Infection Preventionist
Assistant Director of Nursing	Laundry Assistant
Certified Dietary Manager	Laundry Supervisor
Certified Medication Aide	Maintenance Assistant
Certified Nursing Assistant	MDS/RAI Coordinator
Charge Nurse/Nurse Supervisor	Medical Director
Consultant Dietitian	Memory Care Program Coordinator

Version	2.1 (H5MAPL0300)

Handwashing/Hand Hygiene

Policy Statement

This facility considers hand hygiene the primary means to prevent the spread of infections.

Policy Interpretation and Implementation

1. All personnel shall be trained and regularly in-serviced on the importance of hand hygiene in preventing the transmission of healthcare-associated infections.
2. All personnel shall follow the handwashing/hand hygiene procedures to help prevent the spread of infections to other personnel, residents, and visitors.
3. Hand hygiene products and supplies (sinks, soap, towels, alcohol-based hand rub, etc.) shall be readily accessible and convenient for staff use to encourage compliance with hand hygiene policies.
4. Triclosan-containing soaps will not be used.
5. Residents, family members and/or visitors will be encouraged to practice hand hygiene through the use of fact sheets, pamphlets and/or other written materials provided at the time of admission and/or posted throughout the facility.
6. Wash hands with soap (antimicrobial or non-antimicrobial) and water for the following situations:
 - a. When hands are visibly soiled; and
 - b. After contact with a resident with infectious diarrhea including, but not limited to infections caused by norovirus, salmonella, shigella and *C. difficile*.
7. Use an alcohol-based hand rub containing at least 62% alcohol; or, alternatively, soap (antimicrobial or non-antimicrobial) and water for the following situations:
 - a. Before and after coming on duty;
 - b. Before and after direct contact with residents;
 - c. Before preparing or handling medications;
 - d. Before performing any non-surgical invasive procedures;
 - e. Before and after handling an invasive device (e.g., urinary catheters, IV access sites);
 - f. Before donning sterile gloves;
 - g. Before handling clean or soiled dressings, gauze pads, etc.;
 - h. Before moving from a contaminated body site to a clean body site during resident care;
 - i. After contact with a resident's intact skin;
 - j. After contact with blood or bodily fluids;
 - k. After handling used dressings, contaminated equipment, etc.;
 - l. After contact with objects (e.g., medical equipment) in the immediate vicinity of the resident;
 - m. After removing gloves;
 - n. Before and after entering isolation precaution settings;
 - o. Before and after eating or handling food;
 - p. Before and after assisting a resident with meals; and
 - q. After personal use of the toilet or conducting your personal hygiene.
8. Hand hygiene is the final step after removing and disposing of personal protective equipment.

continues on next page

9. The use of gloves does not replace hand washing/hand hygiene. Integration of glove use along with routine hand hygiene is recognized as the best practice for preventing healthcare-associated infections.
10. Single-use disposable gloves should be used:
 - a. before aseptic procedures;
 - b. when anticipating contact with blood or body fluids; and
 - c. when in contact with a resident, or the equipment or environment of a resident, who is on contact precautions.
11. Wearing artificial fingernails is strongly discouraged among staff members with direct resident-care responsibilities, and is prohibited among those caring for severely ill or immunocompromised residents. The infection preventionist maintains the right to request the removal of artificial fingernails at any time if he or she determines that they present an unusual infection control risk.

Procedure

Equipment and Supplies

1. The following equipment and supplies are necessary for hand hygiene:
 - a. Alcohol-based hand rub containing at least 62% alcohol;
 - b. Running water;
 - c. Soap (liquid or bar; anti-microbial or non-antimicrobial);
 - d. Paper towels;
 - e. Trash can;
 - f. Lotion; and
 - g. Non-sterile gloves.

Washing Hands

1. Wet hands first with water, then apply an amount of product recommended by the manufacturer to hands.
2. Rub hands together vigorously for at least 15 seconds, covering all surfaces of the hands and fingers.
3. Rinse hands with water and dry thoroughly with a disposable towel.
4. Use towel to turn off the faucet.
5. Avoid using hot water, because repeated exposure to hot water may increase the risk of dermatitis.

Using Alcohol-Based Hand Rubs

1. Apply generous amount of product to palm of hand and rub hands together.
2. Cover all surfaces of hands and fingers until hands are dry.
3. Follow manufacturers' directions for volume of product to use.

Applying and Removing Gloves

1. Perform hand hygiene before applying non-sterile gloves.
2. When applying, remove one glove from the dispensing box at a time, touching only the top of the cuff.

continues on next page

3. When removing gloves, pinch the glove at the wrist and peel away from the hand, turning the glove inside out.
4. Hold the removed glove in the gloved hand and remove the other glove by rolling it down the hand and folding it into the first glove.
5. Perform hand hygiene.

Version	2.3 (H5MAPL0362)

Hepatitis B Vaccine

Policy Statement

Hepatitis B vaccination is offered to all unvaccinated adults at risk for HBV infection and for adults requesting protection from HBV infection, unless the vaccine is contraindicated.

Policy Interpretation and Implementation

Immunization of Staff

1. Our facility provides hepatitis B vaccines to staff who have not previously been immunized or who are not known to be immune to the hepatitis B virus (HBV).
2. If an individual has previously received the hepatitis vaccine series, his or her antibody to hepatitis B surface antigen (anti-HBs) status may be measured. If the anti-HBs is <10 mIU/mL, he or she will be offered one or more additional doses of Hep B vaccine and retested. (See Figure 1 below.)
3. Employees who are pregnant at the time of vaccination must provide the infection preventionist (or designee) with written authorization from an obstetrician before the vaccine may be administered.
4. Lactating mothers must provide the infection preventionist (or designee) with written authorization from a pediatrician before the vaccine may be administered.
5. All eligible employees are given the hepatitis B vaccine series free of charge.
6. If an employee receives the vaccine series from his or her personal physician, the employee should provide the infection preventionist (or designee) with proof of vaccination.
7. If an employee initially declines the vaccines, he or she may opt to receive the vaccine at a later time in accordance with this policy.

Immunization of Residents

1. Residents are screened for vaccination status and risk for HBV infection and offered the vaccine if appropriate.
2. For residents who were previously vaccinated, serological testing prior to re-vaccination may be indicated.¹
3. Serological testing² is considered for:
 - a. household, sexual, or needle contacts of hepatitis B surface antigen (HBsAg)–positive persons†;
 - b. HIV-positive persons†;
 - c. persons with elevated alanine aminotransferase/aspartate aminotransferase of unknown etiology†;
 - d. hemodialysis patients†;
 - e. men who have sex with men†;

continues on next page

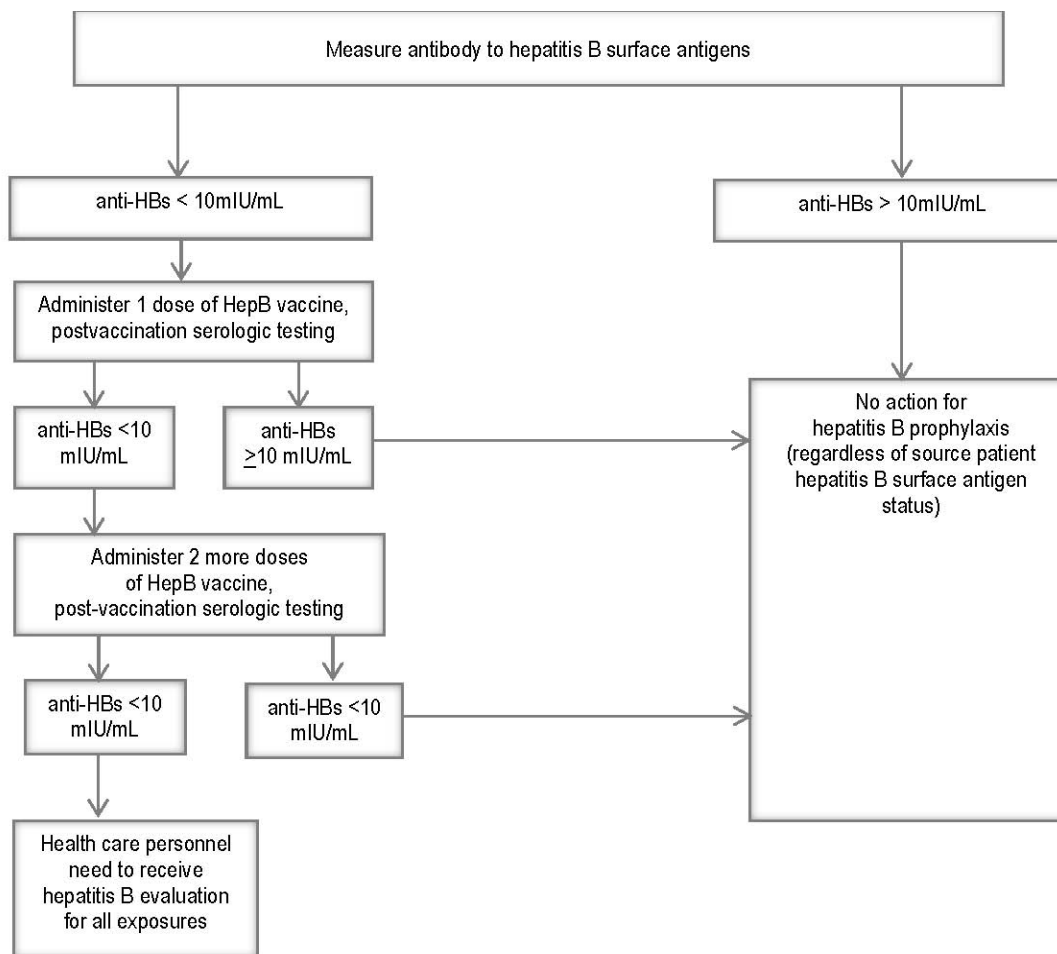

1. Serologic testing comprises testing for hepatitis B surface antigen (HBsAg), antibody to HBsAg, and antibody to hepatitis B core antigen.
 2. †Denotes persons also recommended for hepatitis B vaccination. Serologic testing should occur prior to vaccination. Serologic testing should not be a barrier to vaccination of susceptible persons. The first dose of vaccine should typically be administered immediately after collection of the blood for serologic testing.

- f. past or current persons who inject drugs†;
 - g. persons born in countries of high and intermediate hepatitis B virus (HBV) endemicity (HBsAg prevalence $\geq 2\%$);
 - h. U.S.-born persons not vaccinated as infants whose parents were born in countries with high HBV endemicity ($\geq 8\%$);
 - i. persons needing immunosuppressive therapy, including chemotherapy, immunosuppression related to organ transplantation, and immunosuppression for rheumatologic or gastroenterologic disorders; or
 - j. donors of blood, plasma, organs, tissues, or semen.
4. Residents who have a history of immunosuppressive disorders, receive hemodialysis, or are infected with the human immunodeficiency virus (HIV), must have an order from their physician before the vaccine may be administered.
 5. Residents may be charged for the hepatitis vaccine.

Informed Consent

1. Prior to vaccine administration, the infection preventionist (or designee) provides residents (or representatives) and staff with information pertaining to hepatitis B vaccination.
2. Staff and residents (or representatives) are required to sign an informed consent acknowledging their understanding of the information provided.

Herpes Zoster Vaccine

Policy Statement

All residents over the age of 60 years will be offered the herpes zoster vaccine unless the resident's clinical condition or situation contraindicates administration of the vaccine.

Policy Interpretation and Implementation

1. Prior to or upon admission, each resident will be assessed for eligibility to receive the herpes zoster vaccine, and when indicated the resident will be offered the vaccine within thirty (30) days of admission to the facility unless medically contraindicated or the resident has already been immunized.
2. Assessments of herpes zoster vaccination status will be conducted within five (5) working days of the resident's admission if not conducted prior to admission.
3. Before receiving the herpes zoster vaccine, the resident or legal representative shall receive information and education regarding the benefits and potential side effects of the herpes zoster vaccine. (See current vaccine information statements at <http://www.cdc.gov/vaccines/hcp/vis/index.html> for educational materials.) Provision of such education shall be documented in the resident's medical record.
4. Residents/representatives have the right to refuse vaccine. If refused, appropriate entries will be documented in each resident's medical record indicating the date of the refusal of the vaccine.
5. For residents who receive the vaccine, the date of vaccination, lot number, expiration date, person administering, and the site of vaccination will be documented in the resident's medical record.
6. Administration of the herpes zoster vaccine will be made in accordance with current Centers for Disease Control and Prevention (CDC) recommendations at the time of the vaccination.
7. Inquiries concerning our facility's policies governing vaccinations should be referred to the infection preventionist or director of nursing services.

HIV Antibody Testing and Post-Exposure Prophylaxis

Policy Statement

HIV antibody testing and post-exposure prophylaxis (PEP) will be made available to healthcare personnel as appropriate, following possible exposure in the workplace.

Policy Interpretation and Implementation

1. HIV antibody testing will be made available to healthcare personnel following occupational:
 - a. parenteral exposure to blood or body fluids by needlestick or contamination of an open wound;
 - b. mucous membrane exposure to blood or body fluids;
 - c. cutaneous exposure to large amounts of blood; and
 - d. contact with blood, especially if skin is chapped, abraded, or inflamed.
2. If the healthcare personnel is exposed to a source person who is HIV infected, or there is reasonable suspicion of HIV infection, a PEP protocol will be initiated as soon as possible (within 72 hours).
3. The post exposure protocol includes:
 - a. counseling;
 - b. baseline and follow-up HIV antibody testing;
 - c. anti-retroviral therapy; and
 - d. monitoring for drug toxicity.
4. Initial counseling will be available to exposed individuals immediately after exposure. Exposed healthcare personnel will be re-evaluated within 72 hours of reported exposure.
5. Pre- and post-test counseling will be performed by a licensed healthcare professional knowledgeable in the indications, implications, and interpretations of HIV antibody testing.
6. Expert consultation will be sought under the following situations:
 - a. Exposure is reported later than 72 hours after the incident;
 - b. Source of exposure is unknown (e.g., needle stick from sharps container);
 - c. Exposed healthcare personnel is pregnant or breastfeeding;
 - d. Known resistance of source virus to one or more anti-retroviral agents;
 - e. Adverse reaction(s) to the medication regimen; and/or
 - f. Significant underlying illness of the exposed healthcare personnel.
7. All counseling, testing, and maintenance of files will be performed in a confidential manner.
8. The HIV status of the source individual will be determined (upon consent) as soon as possible after the exposure incident.
9. The source individual will be tested in accordance with current federal, state, and/or local regulations governing antibody testing. An informed consent from the source individual (or legal representative) will be obtained before conducting an HIV antibody test.
10. Baseline and follow-up testing (frequency and duration) of exposed healthcare personnel will be consistent with current guidelines and recommendations regarding PEP. Current recommendations are:

continues on next page

- a. HIV tests at baseline (within 72 hours of reported exposure), then follow-up tests at 6 weeks, 12 weeks and 6 months after exposure.
 - b. If 4th generation (combination HIV p24 antigen–HIV antibody) test is used, test at baseline, 6 weeks and 4 months after exposure.
11. HIV test results will be forwarded to the healthcare professional selected by the facility, or chosen by the exposed individual, who will coordinate post-test counseling and therapy, as indicated and in accordance with current guidelines.
 12. Anti-retroviral therapy of exposed healthcare personnel will be implemented under the consultation of a physician or provider who has experience and expertise in the administration of anti-retroviral therapy and HIV transmission.
 13. Medication regimen will be started (upon consent) as soon as possible after occupational exposure.
 14. Exposed healthcare personnel will be counseled about the risks and benefits of post-exposure anti-viral therapy.
 15. Medication regimen and duration will follow current guidelines and recommendations for post-exposure prophylaxis.
 16. Healthcare personnel receiving anti-retroviral therapy will be monitored for drug toxicity, adverse effects, and potential drug interactions. Complete blood counts and renal and hepatic function tests should be ordered at baseline and 2 weeks after exposure. If toxicities are identified, an expert will be consulted for possible modification of the regimen.
 17. Should an employee be exposed to the blood of a known HIV antibody positive person, the employee will be offered the option of entering the Centers for Disease Control’s (CDC) prospective surveillance system.

Influenza, Prevention and Control of Seasonal

Policy Statement

This facility follows current guidelines and recommendations for the prevention and control of seasonal influenza.

Policy Interpretation and Implementation

1. The prevention of seasonal influenza outbreaks is a coordinated effort which is organized by the infection preventionist and overseen by the medical director.
2. The strategies for prevention are reviewed annually and revised as necessary.

Vaccination

1. The infection preventionist organizes and oversees an annual influenza vaccine campaign.
2. All residents and staff are offered the vaccine prior to the onset of the influenza season.
3. All residents and staff are encouraged to receive the vaccine unless there is a medical contraindication.
4. Systematic strategies to improve staff vaccination rates may include:
 - a. providing education about the risks and benefits of vaccination;
 - b. providing vaccine at no cost to staff;
 - c. improving access (e.g., offering vaccination at work and during work hours); and
 - d. mandating influenza vaccination for staff without contraindication.

Surveillance

1. When there is influenza activity in the local community, or one laboratory-confirmed influenza case is identified in the facility, active daily surveillance for influenza illness is conducted among all new and current residents, healthcare personnel and visitors.

Environmental Cleaning

1. Established procedures for environmental cleaning are based on current CDC recommendations.
2. Standard cleaning and disinfection procedures are used for influenza virus environmental control in all settings within the facility.
3. Management of laundry, food service utensils, and medical waste are also performed in accordance with standard procedures.

Training and Education

1. All staff receive job- or task-specific education and training on preventing transmission of infectious agents, including influenza, during orientation to the facility.
2. Key aspects of influenza prevention and control training include:
 - a. the modes of influenza transmission;
 - b. influenza signs, symptoms, complications, and risk factors for complications;

continues on next page

- c. self-assessment and reporting of signs and symptoms of influenza;
 - d. employee sick leave policies;
 - e. review of standard and transmission-based precautions;
 - f. appropriate use of personal protective equipment; and
 - g. engineering controls, work practices and procedures to reduce exposure.
3. New or revised information is provided during subsequent education and training programs.
 4. Competencies are evaluated and documented, as appropriate, for specific staff positions.
 5. Staff employed by outside employers must meet these education and training requirements through programs offered by the outside employer or by participation in our programs.

Visitation

1. During periods of increased influenza activity in the community steps are taken to minimize elective visits by individuals with suspected or confirmed influenza.
2. Visitor restrictions may be considered at the discretion of the administrative staff, including the director of nursing services, the administrator and the infection preventionist.
3. All visitors are instructed to follow respiratory hygiene and cough etiquette precautions.

Influenza Control

Symptomatic Residents and Visitors

1. Residents and visitors are asked to inform staff if they have symptoms of any respiratory infection (e.g., cough, runny nose, fever).
2. This request is made as part of the admission assessment process and/or during screening for communicable diseases.
3. Residents and visitors are reminded to report signs and symptoms of respiratory infection through the posting of signs at the entrance to and in public areas of the facility.
4. Staff are trained in recognizing and reporting signs of respiratory illness observed in residents.
5. All persons with symptoms of a respiratory infection are encouraged to adhere to respiratory hygiene, cough etiquette and hand hygiene procedures throughout the duration of the stay/visit.
6. Visits to residents on precautions for influenza are scheduled and controlled to allow for:
 - a. screening visitors for symptoms of acute respiratory illness before entering the facility; and
 - b. providing instruction, before visitors enter residents' rooms, on hand hygiene, limiting surfaces touched, and use of personal protective equipment (PPE) while in the resident's room.
7. Visual alerts (e.g., signs, posters) are posted at the entrance to and in common areas of the facility to provide residents, visitors and staff with instructions about respiratory hygiene and cough etiquette. Instructions (in appropriate languages) include:
 - a. how to use facemasks or tissues to cover nose and mouth when coughing or sneezing and to dispose of contaminated items in waste receptacles; and
 - b. how and when to perform hand hygiene.

continues on next page

8. Any resident with signs and symptoms of respiratory infection may be asked to take appropriate preventive actions (e.g., wearing a face mask) until he or she can be evaluated by a clinician.
9. Facemasks are provided to visitors with signs and symptoms of respiratory infection.
10. Supplies to perform hand hygiene are available to all residents and visitors in common areas and in resident rooms.

Symptomatic Healthcare Workers

1. The infection preventionist and/or designee monitors and manages ill healthcare personnel.
2. Staff who develop fever and respiratory symptoms are:
 - a. instructed not to report to work, or if at work, to stop resident-care activities, don a facemask, and promptly notify their supervisor and the infection preventionist and/or designee before leaving work.
 - b. excluded from work until at least 24 hours after they no longer have a fever (without the use of fever-reducing medicines such as acetaminophen). Those with ongoing respiratory symptoms will be considered for evaluation by the infection preventionist and/or designee to determine appropriateness of contact with residents.
 - c. considered for temporary reassignment or exclusion from work for 7 days from symptom onset or until the resolution of symptoms, whichever is longer, if returning to care for immunocompromised residents.
3. Staff with fever alone will follow the general policy for staff with fever until a more specific cause of fever is identified or until fever resolves.
4. Staff who develop acute respiratory symptoms without fever may still have influenza infection and are evaluated by the infection preventionist to determine appropriateness of contact with residents.
5. If assigned to care for immunocompromised residents the infection preventionist may consider, temporary reassignment or exclusion of staff from work for 7 days from symptom onset or until the resolution of all non-cough symptoms, whichever is longer.
6. Sick leave policies for staff are non-punitive, flexible and consistent with public health guidance to allow and encourage staff with suspected or confirmed influenza to stay home.

Laboratory Testing for Influenza

1. Laboratory testing for influenza is considered for residents (whether or not it is influenza season):
 - a. with signs or symptoms of influenza (Table 2); OR
 - b. for high risk residents (Table 4) who have atypical signs and symptoms (Table 3); AND
 - c. for residents in which test results will influence clinical management.
2. Confirmation of influenza infection by laboratory testing is not required in order to prescribe antiviral medication, and antiviral treatment is not delayed while awaiting test results.

continues on next page

Antiviral Medication

1. Antiviral treatment and chemoprophylaxis are administered to residents and staff when appropriate, and in accordance with current CDC guidelines.

Infection Precautions

1. Contact and droplet precautions are implemented for residents with suspected or confirmed influenza for seven (7) days after illness onset or until 24 hours after the resolution of fever and respiratory symptoms, whichever is longer. Precautions may be applied for longer periods based on clinical judgment.
2. Information about residents with suspected, probable, or confirmed influenza is communicated to appropriate personnel before transferring them to other departments in the facility or to other facilities.
3. Residents are discharged from care when clinically appropriate, not based on the period of potential virus shedding or recommended duration of transmission-based precautions. Before discharge, the resident's diagnosis and current precautions are provided to care providers as well as transporting personnel.
4. Precautions for aerosol-generating procedures (e.g., suctioning, intubation, etc.) include:
 - a. only performing these procedures on residents with suspected or confirmed influenza if they are medically necessary and cannot be postponed;
 - b. limiting the number of staff present during the procedure to only those essential for resident care and support;
 - c. conducting the procedures in an airborne infection isolation room (AIIR) when feasible;
 - d. considering use of portable HEPA filtration units to further reduce the concentration of contaminants in the air;
 - e. wearing respiratory protection equivalent to a fitted N95 filtering face piece respirator or equivalent N95 respirator; and
 - f. conducting environmental surface cleaning following procedures.
5. Work accommodations to avoid potentially high-risk exposure scenarios, such as performing or assisting with aerosol-generating procedures on residents with suspected or confirmed influenza, are considered for staff at high risk for complications.

Version	1.3 (H5MAPL1421)

Influenza Vaccine

Policy Statement

All residents and employees who have no medical contraindications to the vaccine will be offered the influenza vaccine annually to encourage and promote the benefits associated with vaccinations against influenza.

The facility shall provide pertinent information about the significant risks and benefits of vaccines to staff and residents (or residents' legal representatives); for example, risk factors that have been identified for specific age groups or individuals with risk factors such as allergies or pregnancy.

Policy Interpretation and Implementation

1. Between October 1st and March 31st each year, the influenza vaccine shall be offered to residents and employees, unless the vaccine is medically contraindicated or the resident or employee has already been immunized.
2. Employees hired or residents admitted between October 1st and March 31st shall be offered the vaccine within five (5) working days of the employee's job assignment or the resident's admission to the facility.
3. Employees will be offered the influenza vaccine at no charge, at a location onsite.
4. Prior to the vaccination, the resident (or resident's legal representative) or employee will be provided information and education regarding the benefits and potential side effects of the influenza vaccine. (See current vaccine information statements at <https://www.cdc.gov/vaccines/hcp/vis/index.html> for educational materials.) Provision of such education shall be documented in the resident's/employee's medical record.
5. For those who receive the vaccine, the date of vaccination, lot number, expiration date, person administering, and the site of vaccination will be documented in the resident's/employee's medical record.
6. A resident's refusal of the vaccine shall be documented on the *Informed Consent for Influenza Vaccine* and placed in the resident's medical record.
7. If an employee refuses the vaccine for reasons other than medical contraindication, this shall be documented on the *Employee Informed Consent for Influenza Vaccine*.
8. The infection preventionist will maintain surveillance data on influenza vaccine coverage and reported rates of influenza among residents and staff. Surveillance data will be made available to staff as part of educational efforts to improve vaccination rates among employees.
9. Only inactivated influenza vaccine will be offered to residents, pregnant employees, and employees who work directly with severely immunocompromised residents.
10. Residents and staff may obtain their influenza vaccines from their personal physicians. Documentation of previous vaccination should be provided to the facility.

continues on next page

11. Administration of the influenza vaccine will be made in accordance with current Centers for Disease Control and Prevention (CDC) recommendations at the time of the vaccination.

Laundry and Bedding, Soiled

Policy Statement

Soiled laundry/bedding shall be handled, transported and processed according to best practices for infection prevention and control.

Policy Interpretation and Implementation

Handling

1. All used laundry is handled as potentially contaminated until it is properly bagged and labeled for appropriate processing.
 - a. Soiled laundry and bedding (e.g., personal clothing, uniforms, scrub suits, gowns, bed sheets, blankets, pillows, towels, etc.) contaminated with blood or other potentially infectious materials is handled as little as possible and with a minimum of agitation.
 - b. Laundry that is contaminated with blood or body substances is placed in leak-proof bags or containers.
 - c. Contaminated laundry is placed in a bag or container at the location where it is used and not sorted or rinsed at the location of use.

Transport

1. Contaminated laundry bags/containers are not held close to the body or squeezed during transport.
2. There are no additional requirements for transporting linen from rooms where transmission-based precautions are in effect.
3. Linen carts are cleaned and disinfected whenever visibly soiled and according to the established schedule.
4. Carts that are used for transport of dirty linen are thoroughly cleaned and disinfected before being used to transport clean linens.
5. Clean linens are protected from dust and soiling during transport and storage to ensure cleanliness.
6. Clean linens are stored separately, away from soiled linens, at all times.

Processing

1. Laundry services are provided by:
 - a. _____ (onsite); or
 - b. _____ (offsite).
2. Sharps containers are located in the laundry room. Sharps (e.g., needles, razor blades, etc.) found in laundry are discarded in the sharps container.
3. Forceps/tongs or similar safe sorting devices are available for sorting laundry.

continues on next page

Mattresses, Pillows and Overlays

1. Moisture-resistant mattress covers are cleaned and disinfected using EPA-registered disinfectants between uses by different residents.
2. Fabric mattress covers are laundered between uses by different residents.
3. Mattresses that are torn, stained with bodily fluids, or have been wet for prolonged periods are discarded.
4. Air fluidized beds and pressure-reducing overlays are maintained, cleaned, and replaced in accordance with manufacturers' instructions.
5. Washable pillows are laundered in hot water when soiled with bodily substances and before exchange between residents. Pillows that are torn, damaged, or permanently stained are discarded.

Personal Clothing

1. Personal clothing that becomes soiled with blood or body fluids is covered (e.g., with a gown) or removed and immediately laundered before leaving the work area.
2. Employees' personal protective equipment, uniforms or clothing contaminated with blood or other potentially infectious materials are laundered, replaced, or repaired at no cost to the employee.

Legionella Surveillance and Detection

Policy Statement

Our facility is committed to the prevention, detection and control of water-borne contaminants, including *Legionella*. Legionnaire's disease will be included as part of our infection surveillance activities.

Policy Interpretation and Implementation

1. As part of the infection prevention and control program, all cases of pneumonia that are diagnosed in residents \geq 48 hours after admission will be investigated for possible legionnaire's disease.
2. Clinical staff will be trained on the following signs and symptoms associated with pneumonia and Legionnaire's:
 - a. Cough;
 - b. Shortness of breath;
 - c. Fever;
 - d. Muscle aches;
 - e. Headache; and
 - f. Diarrhea, nausea and confusion associated with legionnaire's disease.
3. If pneumonia or legionnaire's disease are suspected, the nurse will notify the physician or practitioner immediately.
4. Residents who have signs and symptoms of pneumonia may be placed on transmission-based (droplet) precautions, although person-to-person transmission is rare.
5. Diagnosis of legionnaire's disease is based on a culture of lower respiratory secretions and urinary antigen testing (concurrently).
6. Depending on the severity of illness, a hospital transfer may be initiated.
7. If legionella is detected in one or more residents, the infection preventionist will:
 - a. initiate active surveillance for legionnaire's diseases;
 - b. notify the local health department; and
 - c. notify the administrator and the director of nursing services.
8. The infection preventionist will meet with the water management team to investigate the possible source of contamination.

Version	1.0 (H5MAPL1449)

Legionella Water Management Program

Policy Statement

Our facility is committed to the prevention, detection and control of water-borne contaminants, including *Legionella*.

Policy Interpretation and Implementation

1. As part of the infection prevention and control program, our facility has a water management program, which is overseen by the water management team.
2. The water management team will consist of at least the following personnel:
 - a. The infection preventionist;
 - b. The administrator;
 - c. The medical director (or designee);
 - d. The director of maintenance; and
 - e. The director of environmental services.
3. The purposes of the water management program are to identify areas in the water system where *Legionella* bacteria can grow and spread, and to reduce the risk of legionnaire's disease.
4. The water management program used by our facility is based on the Centers for Disease Control and Prevention and ASHRAE recommendations for developing a *Legionella* water management program.
5. The water management program includes the following elements:
 - a. An interdisciplinary water management team;
 - b. A detailed description and diagram of the water system in the facility, including the following:
 - (1) Receiving;
 - (2) Cold water distribution;
 - (3) Heating;
 - (4) Hot water distribution; and
 - (5) Waste.
 - c. The identification of areas in the water system that could encourage the growth and spread of *Legionella* or other waterborne bacteria, including the following:
 - (1) Storage tanks;
 - (2) Water heaters;
 - (3) Filters;
 - (4) Aerators;
 - (5) Showerheads and hoses;
 - (6) Misters, atomizers, air washers and humidifiers;
 - (7) Hot tubs;
 - (8) Fountains; and
 - (9) Medical devices such as CPAP machines, hydrotherapy equipment, etc.

continues on next page

- d. The identification of situations that can lead to *Legionella* growth, such as:
 - (1) construction;
 - (2) water main breaks;
 - (3) changes in municipal water quality;
 - (4) the presence of biofilm, scale or sediment;
 - (5) water temperature fluctuations;
 - (6) water pressure changes;
 - (7) water stagnation; and
 - (8) inadequate disinfection.
 - e. Specific measures used to control the introduction and/or spread of *legionella* (e.g., temperature, disinfectants);
 - f. The control limits or parameters that are acceptable and that are monitored;
 - g. A diagram of where control measures are applied;
 - h. A system to monitor control limits and the effectiveness of control measures;
 - i. A plan for when control limits are not met and/or control measures are not effective; and
 - j. Documentation of the program.
6. The water management program will be reviewed at least once a year, or sooner if any of the following occur:
- a. The control limits are consistently not met;
 - b. There is a major maintenance or water service change;
 - c. There are any disease cases associated with the water system; or
 - d. There are changes in laws, regulations, standards or guidelines.

Needlesticks and Cuts

Policy Statement

All personnel must follow our facility’s established procedures to help prevent injuries caused by needles, sharp blades, broken glass, or other sharp instruments or devices, and to report all such incidents that occur.

Policy Interpretation and Implementation

1. The staff shall handle with caution used needles, sharp blades, broken glass, or other sharp objects or devices, to reduce the possibility of needlestick injuries and cuts.
2. To help prevent needlestick injuries, needles shall not be recapped, purposely bent or broken by hand, removed from disposable syringes, or otherwise manipulated by hand.
3. Staff shall place used needles and other sharp objects in puncture-resistant containers.
4. All personnel shall report needlestick injuries and cuts to their supervisor, who shall report the injury to the infection preventionist as soon as practical.
5. The facility has established procedures governing the handling and disposing of used needles and syringes. Copies of such procedures are available from the infection preventionist and director of nursing services.

Pneumococcal Vaccine

Policy Statement

All residents will be offered pneumococcal vaccines to aid in preventing pneumonia/pneumococcal infections.

Policy Interpretation and Implementation

1. Prior to or upon admission, residents will be assessed for eligibility to receive the pneumococcal vaccine series, and when indicated, will be offered the vaccine series within thirty (30) days of admission to the facility unless medically contraindicated or the resident has already been vaccinated.
2. Assessments of pneumococcal vaccination status will be conducted within five (5) working days of the resident's admission if not conducted prior to admission.
3. Before receiving a pneumococcal vaccine, the resident or legal representative shall receive information and education regarding the benefits and potential side effects of the pneumococcal vaccine. (See current vaccine information statements at <https://www.cdc.gov/vaccines/hcp/vis/index.html> for educational materials.) Provision of such education shall be documented in the resident's medical record.
4. Pneumococcal vaccines will be administered to residents (unless medically contraindicated, already given, or refused) per our facility's physician-approved pneumococcal vaccination protocol.
5. Residents/representatives have the right to refuse vaccination. If refused, appropriate entries will be documented in each resident's medical record indicating the date of the refusal of the pneumococcal vaccination.
6. For residents who receive the vaccines, the date of vaccination, lot number, expiration date, person administering, and the site of vaccination will be documented in the resident's medical record.
7. Administration of the pneumococcal vaccines or revaccinations will be made in accordance with current Centers for Disease Control and Prevention (CDC) recommendations at the time of the vaccination.

Sharps Disposal

Policy Statement

This facility shall discard contaminated sharps into designated containers.

Policy Interpretation and Implementation

1. Whoever uses contaminated sharps will discard them immediately or as soon as feasible into designated containers.
2. Contaminated sharps will be discarded into containers that are:
 - a. closable;
 - b. puncture resistant;
 - c. leakproof on sides and bottom;
 - d. labeled or color-coded in accordance with our established labeling system; and
 - e. impermeable and capable of maintaining impermeability through final waste disposal.
3. During use, containers for contaminated sharps will be handled as follows:
 - a. Designated individuals will ensure that the containers are easily accessible to employees and located as close as feasible to the immediate area where sharps are used or can be reasonably anticipated to be found;
 - b. Nursing staff will ensure that the containers are maintained in an upright position throughout use; and
 - c. Designated individuals will be responsible for sealing and replacing containers when they are 75% to 80% full to protect employees from punctures and/or needlesticks when attempting to push sharps into the container.
4. When moving containers of contaminated sharps from the area of use, employees must:
 - a. close the container immediately prior to removal or replacement to prevent contents from spilling or protruding during handling, storage, transport, or shipping;
 - b. place the container in a secondary container if leakage is possible; and
 - c. if a second container is used, it must be:
 - (1) closable;
 - (2) constructed to contain all contents and prevent leakage during handling, storage, transport, or shipping; and
 - (3) labeled or color-coded according to established policies governing the labeling of containers.
 - d. seal and replace containers when they are 75% to 80% full to protect employees from punctures and/or needlesticks when attempting to push sharps into the container.

continues on next page

5. No one shall open, empty, or manually clean reusable containers, or handle such containers in a manner which would expose him/her to the risk of percutaneous injury.
6. No one shall bend, recap, or break used syringe needles before discarding into the sharps container.
7. Whoever observes incorrect disposal or handling of contaminated sharps should report the information to the infection preventionist (or designee).

Standard Precautions

Policy Statement

Standard precautions are used in the care of all residents regardless of their diagnoses, or suspected or confirmed infection status. Standard precautions presume that all blood, body fluids, secretions, and excretions (except sweat), non-intact skin and mucous membranes may contain transmissible infectious agents.

Policy Interpretation and Implementation

1. Standard precautions apply to the care of all residents in all situations regardless of suspected or confirmed presence of infectious diseases.
2. Personnel are trained in the various aspects of standard precautions to ensure appropriate decision-making in various clinical situations.
3. Residents and family members are provided with information pertaining to standard precautions and the prevention of infection upon the resident's admission to the facility.
4. Visitors are reminded and encouraged to maintain hand hygiene and follow instructions regarding infection prevention and control while in the facility.

Standard precautions include the following practices:

1. Hand hygiene
 - a. Hand hygiene refers to handwashing with soap (anti-microbial or non-antimicrobial) or the use of alcohol-based hand rub (ABHR), which does not require access to water.
 - b. Hand hygiene is performed with *ABHR* or *soap and water*:
 - (1) before and after contact with the resident;
 - (2) before performing an aseptic task;
 - (3) after contact with items in the resident's room; and
 - (4) after removing PPE.
 - c. Hands are *washed with soap and water* whenever:
 - (1) visibly soiled with dirt, blood, or body fluids;
 - (2) after direct or indirect contact with dirt, blood or body fluids;
 - (3) after removing gloves; and
 - (4) before eating and after using the restroom.
 - d. Sinks, soap, water, disposable towels and ABHR are available to personnel and visitors in readily accessible and visible locations throughout the facility.
 - e. Except as noted above, ABHR is preferred for hand hygiene.
 - f. Artificial fingernails are discouraged among staff with direct resident contact.
 - g. Personnel assist the residents with hand hygiene before meals, after toileting and when indicated.
 - h. Proper hand washing technique is described in the hand washing/ hand hygiene policy and procedure.
2. Gloves
 - a. Gloves (clean, non-sterile) are worn when in direct contact with blood, body fluids, mucous membranes, non-intact skin, and other potentially infected material.

continues on next page

- b. Gloves are worn when in direct contact with a resident who is infected or colonized with organisms that are transmitted by direct contact. (For specific pathogens, refer to current CDC isolation precautions guidelines.)
 - c. Gloves are worn when handling or touching resident-care equipment that is visibly soiled or potentially contaminated with blood, body fluids, or infectious organisms.
 - d. Gloves with fit and durability appropriate to the task are available to personnel at all times.
 - e. Gloves are changed as necessary, during the care of a resident to prevent cross-contamination from one body site to another (when moving from a “dirty” site to a “clean” one).
 - f. Gloves are not to be reused.
 - g. Gloves are removed promptly after use, before touching non-contaminated items and environmental surfaces, and before going to another resident.
 - h. After gloves are removed, wash hands immediately to avoid transfer of microorganisms to other residents or environments.
3. Masks, Eye Protection, Face Shields
 - a. Mask and eye protection or a face shield are worn to protect mucous membranes of the eyes, nose, and mouth during procedures and resident-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, and excretions.
 - b. Use mouthpieces, resuscitation bags, or other ventilation devices as an alternative to mouth-to-mouth resuscitation methods in areas where the need for resuscitation is predictable.
 4. Gowns
 - a. Gowns (clean, non-sterile) are worn to protect skin and prevent soiling of clothing during procedures and resident care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, or excretions or cause soiling of clothing.
 - b. Gowns that are appropriate to the task are available to personnel at all times.
 - c. Soiled gowns are removed as promptly as possible and hands washed to avoid transfer of microorganisms to other residents or environments.
 - d. Gowns are not reused.
 5. Resident-Care Equipment
 - a. Resident-care equipment soiled with blood, body fluids, secretions, and excretions are handled in a manner that prevents skin and mucous membrane exposure, contamination of clothing, and transfer of microorganisms to other residents and environments.
 - b. Reusable equipment is not used for the care of more than one resident until it has been appropriately cleaned and reprocessed.
 - c. Single use items are properly discarded.
 6. Environmental Control
 - a. Environmental surfaces, beds, bedrails, bedside equipment and other frequently touched surfaces are appropriately cleaned.
 7. Linen
 - a. Linen soiled with blood, body fluids, secretions, excretions are handled and processed in a manner that prevents skin and mucous membrane exposures, contamination of clothing, and avoids transfer of microorganisms to other residents and environments.

continues on next page

8. Safe Needle Handling
 - a. Used needles are never recapped or otherwise manipulated using two hands, or any other technique that involves directing the point of a needle toward any part of the body.
 - b. Used needles are not removed from disposable syringes by hand, and not bent, broken, or otherwise manipulated by hand.
 - c. Used disposable syringes and needles, scalpel blades, and other sharp items are placed in appropriate puncture-resistant containers located as close as practicable to the area in which the items were used.
9. Safe Injection Practices – The following principles are applied to the use of needles, cannulas that replace needles, and intravenous delivery systems:
 - a. Always use aseptic technique when handling injection equipment.
 - b. Never re-use syringes, even if the needle or cannula on the syringe is changed.
 - c. Use IV administration sets for one resident only and dispose of appropriately after use.
 - d. Do not use bags of IV solution as a common source for multiple residents.
 - e. Use single-dose vials for parenteral medications.
 - f. Do not administer medications from single-dose vials to multiple residents.
 - g. If multi-dose vials are used, both the cannula and the syringe used to access the vial must be sterile. Discard if the sterility of the vial is compromised.
10. Respiratory Hygiene/Cough Etiquette – The following measures are implemented to contain respiratory secretions in residents, staff and visitors at the point of initial entry into the facility:
 - a. Signs posted at entrances in strategic places with instructions to residents, staff, and visitors to cover their mouths and noses when coughing or sneezing; use and dispose of tissues; and perform hand hygiene after hands have been in contact with respiratory secretions.
 - b. Availability of tissues and no-touch (e.g., foot-pedal operated) trash receptacles for the disposal of tissues.
 - c. Written materials and reminders posted in the facility regarding effective hand hygiene practices.
 - d. Availability of conveniently located supplies and equipment for hand hygiene (e.g., sinks, soap, paper towels, and alcohol-based hand rubs).
 - e. Availability of masks for residents and visitors who have symptoms of a respiratory infection.

Surveillance for Infections

Policy Statement

The infection preventionist will conduct ongoing surveillance for healthcare-associated infections (HAIs) and other epidemiologically significant infections that have substantial impact on potential resident outcome and that may require transmission-based precautions and other preventative interventions.

Policy Interpretation and Implementation

1. The purpose of the surveillance of infections is to identify both individual cases and trends of epidemiologically significant organisms and healthcare-associated infections, to guide appropriate interventions, and to prevent future infections.
2. The criteria for such infections are based on the current standard definitions of infections.
3. Infections that will be included in routine surveillance include those with:
 - a. evidence of transmissibility in a healthcare environment;
 - b. available processes and procedures that prevent or reduce the spread of infection;
 - c. clinically significant morbidity or mortality associated with infection (e.g., pneumonia, UTIs, *C. difficile*); and
 - d. pathogens associated with serious outbreaks. (e.g., invasive *Streptococcus* Group A, acute viral hepatitis, norovirus, scabies, influenza).
4. Infections that may be considered in surveillance include those with limited transmissibility in a healthcare environment; and/or limited prevention strategies.
5. Nursing staff will monitor residents for signs and symptoms that may suggest infection, according to current criteria and definitions of infections, and will document and report suspected infections to the charge nurse as soon as possible.
6. If a communicable disease outbreak is suspected, this information will be communicated to the charge nurse and infection preventionist immediately.
7. When infection or colonization with epidemiologically important organisms is suspected, cultures may be sent, if appropriate, to a contracted laboratory for identification or confirmation. Cultures will be further screened for sensitivity to antimicrobial medications to help determine treatment measures.
8. The charge nurse will notify the attending physician and the infection preventionist of suspected infections.
 - a. The infection preventionist and the attending physician will determine if laboratory tests are indicated, and whether special precautions are warranted.
 - b. The infection preventionist will determine if the infection is reportable.
 - c. The attending physician and interdisciplinary team will determine the treatment plan for the resident.
9. If transmission-based precautions or other preventative measures are implemented to slow or stop the spread of infection, the infection preventionist will collect data to help determine the effectiveness of such measures.

continues on next page

10. When transmission of healthcare-associated infections continues despite documented efforts to implement infection control and prevention measures, the appropriate state agency and/or a specialist in infection control and epidemiology will be consulted for further recommendations.

Gathering Surveillance Data

1. The infection preventionist or designated infection control personnel is responsible for gathering and interpreting surveillance data. The infection control committee and/or QAPI committee may be involved in interpretation of the data.
2. The surveillance should include a review of any or all of the following information to help identify possible indicators of infections:
 - a. Laboratory records;
 - b. Skin care sheets;
 - c. Infection control rounds or interviews;
 - d. Verbal reports from staff;
 - e. Infection documentation records;
 - f. Temperature logs;
 - g. Pharmacy records;
 - h. Antibiotic review; and
 - i. Transfer log/summaries.
3. If laboratory reports are used to identify relevant information, the following findings merit further evaluation:
 - a. Positive blood cultures;
 - b. Positive wound cultures that do not just represent surface colonization;
 - c. Positive urine cultures (bacteriuria) with corresponding signs and symptoms that suggest infection;
 - d. Positive sputum culture;
 - e. Other positive cultures (i.e., stool culture, eye cultures, etc.); and
 - f. All cultures positive for Group A Streptococcus.
4. After removing duplicates and negative reports, prioritize the reports as follows:
 - a. Multidrug-resistant reports:
 - (1) All multidrug-resistant reports require immediate attention.
 - (2) Ensure that appropriate precautions, if needed, are in place.
 - (3) If this is a new or unexpected report notify the administrator, director of nursing services, and medical director;
 - b. Blood cultures;
 - c. Positive wound cultures if there are corresponding signs and symptoms that indicate infection;
 - d. Positive sputum cultures;
 - e. Bacteriuria WITH corresponding signs and symptoms of UTI; and
 - f. Other positive cultures (i.e., eye cultures).
5. In addition to collecting data on the incidence of infections, the surveillance system is designed to capture certain epidemiologically important data that may influence how the overall surveillance data is interpreted; for example, focused surveillance data may be gathered for residents with a high risk for infection or those with a recent hospital stay.

continues on next page

Data Collection and Recording

1. For residents with infections that meet the criteria for definition of infection for surveillance, collect the following data as appropriate:
 - a. Identifying information (i.e., resident's name, age, room number, unit, and attending physician);
 - b. Diagnoses;
 - c. Admission date, date of onset of infection (may list onset of symptoms, if known, or date of positive diagnostic test);
 - d. Infection site (be as specific as possible, e.g., cutaneous infections should be listed as "pressure ulcer, left foot," pneumonia as "right upper lobe," etc.);
 - e. Pathogens;
 - f. Invasive procedures or risk factors (i.e., surgery, indwelling tubes, Foley, fractured hip, malnutrition, altered mental status, etc.);
 - g. Pertinent remarks (additional relevant information, i.e., temperatures, other symptoms of specific infection, white blood cell count, etc.). Also, record if the resident is admitted to the hospital, or expires; and
 - h. Treatment measures and precautions (interventions and steps taken that may reduce risk).
2. Using the current suggested criteria for healthcare-associated Infections, determine if the resident has a healthcare-associated infection.
3. For targeted surveillance and reporting through the CDC National Health Safety Network (NHSN), follow the surveillance protocols for each module using the data collection tools provided at <https://www.cdc.gov/nhsn/ltc/index.html>
4. For targeted surveillance using facility-created tools, follow these guidelines:
 - a. DAILY (as indicated): Record detailed information about the resident and infection on an individual infection report form (e.g., *Infection Treatment/Tracking Report*, *Infection Report Form*, or similar form).
 - b. MONTHLY: Collect information from individual resident infection reports and enter line listing of infections by resident for the entire month (e.g., *Line Listing of Infections by Resident* or similar form).
 - c. MONTHLY: Summarize monthly data for each nursing unit by site and by pathogen (e.g., *Facility-Wide Monthly Infection Report by Site*, *Facility-Wide Monthly Infection Report by Pathogen*, or similar form).
 - d. MONTHLY/QUARTERLY: Identify predominant pathogens or sites of infection among residents in the facility or in particular units by recording them month to month and observing trends. (See *Facility-Wide 12-Month Pathogen Trends* or *Facility-Wide 12-Month Infection Site Trends* or similar tool.)
 - e. MONTHLY/QUARTERLY: Compare incidence of current infections to previous data to identify trends and patterns. Use an average infection rate over a previous time period (for example, over the past 12 months) as the baseline. Compare subsequent rates to the average rate to identify possible increases in infection rates.

Calculating Infection Rates

1. Obtain the month's total resident days from the business office. The following data is used as the denominator to calculate the monthly infection rate:
 - a. Total resident days (daily census of each day in the designated time period added together).

continues on next page

2. To determine the incidence of infection per 1000 resident days, divide the number of new healthcare associated infections for the month by the total resident days for the month (obtained from the business office) X 1000.

Example	
Total number of new infections for the month	16
Total resident days for the month	3025
Infections per 1000 resident days	16 ÷ 3025 x 1000 = 5.3

Interpreting Surveillance Data

1. Analyze the data to identify trends.
 - a. Compare the rates to previous months in the current year and to the same month in previous years, to identify seasonal trends.
 - b. Consider how increases or decreases might relate to recent process changes, events, or activities in the facility (i.e., change in handwashing preparations, increased turnover in personnel or residents, etc.). These, of course, are not necessarily the reason for the change. However, trends should be monitored.
 - c. If the infection rates rise each month over a period of six (6) months, additional advice is warranted.
2. Surveillance data will be provided to the infection control committee regularly.
3. The infection control committee will determine how important surveillance data will be communicated to the physicians and other providers, the administrator, nursing units, and the local and state health departments.

Vaccination of Residents

Policy Statement

All residents will be offered vaccines that aid in preventing infectious diseases unless the vaccine is medically contraindicated or the resident has already been vaccinated.

Policy Interpretation and Implementation

1. Prior to receiving vaccinations, the resident or legal representative will be provided information and education regarding the benefits and potential side effects of the vaccinations. (See current vaccine information statements at <https://www.cdc.gov/vaccines/hcp/vis/index.html> for educational materials.)
2. Provision of such education shall be documented in the resident's medical record.
3. All new residents shall be assessed for current vaccination status upon admission.
4. The resident or the resident's legal representative may refuse vaccines for any reasons.
5. If vaccines are refused, the refusal shall be documented in the resident's medical record.
6. If the resident receives a vaccine, at least the following information shall be documented in the resident's medical record:
 - a. Site of administration;
 - b. Date of administration;
 - c. Lot number of the vaccine (located on the vial);
 - d. Expiration date (located on the vial); and
 - e. Name of person administering the vaccine.
7. Certain vaccines (e.g., influenza and pneumococcal vaccines) may be administered per the physician-approved facility protocol (standing orders) after the resident has been assessed by the physician for medical contraindications for each vaccine. The resident's attending physician must provide a separate written order for any other vaccination, and such orders shall be recorded in the resident's medical record.
8. Inquiries concerning this policy should be referred to the infection preventionist or the administrator.

Visitation, Infection Control During

Policy Statement

The facility shall establish appropriate guidelines for visitors to try to prevent the transmission of communicable diseases.

Policy Interpretation and Implementation

1. Upon admission of the resident to the facility, family members are provided with education that may include an explanation of the facility's infection control practices during visitation. This may include information pertaining to the following:
 - a. Standard precautions;
 - b. Hand hygiene;
 - c. Respiratory hygiene;
 - d. Vaccinations; and
 - e. Signs and symptoms of common communicable diseases.
2. Visitors are encouraged to perform hand hygiene upon arrival, before entering a resident's room and when leaving the facility. Sinks and ABHR are easily accessible to visitors.
3. Visitors are instructed on proper cough etiquette/respiratory hygiene through signs posted throughout the facility.
4. Visiting a resident who is under transmission-based precautions is permitted.
 - a. Family members and visitors who are providing care or have very close contact with the resident are trained regarding the appropriate use of infection control barriers such as personal protective equipment.
 - b. Adherence to transmission-based precautions by visitors is required.
5. The administrator, in conjunction with the medical director and infection preventionist, has the authority to restrict or ban facility visitation during outbreaks, whether these originate in the facility or in the community.
6. Signs and the facility entrance discourage anyone from visiting when they have potentially contagious infections (for example, upper respiratory infection (URI), influenza, gastroenteritis, or unexplained rashes).
7. Visitors who are symptomatic of communicable diseases may be denied visitation at the discretion of the charge nurse until appropriate evaluation and treatment of the visitor has been established.
8. Visitors must follow instructions from the charge nurse on duty regarding facility infection control practices and visitation restrictions.
9. The facility does not have an age restriction policy. However, visitors under the age of twelve (12) must be strictly supervised. Violations of these policies must be reported to the administrator. The administrator has the right to restrict or ban visitors as indicated.

Cleaning Broken Glass When Contaminated With Blood or Body Fluids

Level I

Purpose

The purpose of this procedure is to remove the hazards of broken glass from all areas while taking care to disinfect the area in the event of blood/body fluid spills.

Preparation

Assemble the equipment and supplies needed.

General Guidelines

1. Notify environmental services of spills of blood or body fluids with incidents that result in broken glass.
2. Never pick up broken glass by hand, regardless of glove usage.
3. Spills of blood and other potentially infectious materials will promptly be cleaned and decontaminated. Blood-contaminated items will be discarded in compliance with federal regulations (i.e., OSHA Bloodborne Pathogens Standard).

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure for blood and body fluid spills.

1. OSHA compliant Blood Spill Kit.
2. If spill kit is unavailable, proceed to obtain the following equipment:
 - a. Absorbent granules;
 - b. Mop;
 - c. Disinfectant/bleach/EPA Registered germicidal solution;
 - d. Plastic scoop or specially marked dustpan;
 - e. Brush/tongs/forceps;
 - f. Sharps container (or larger puncture-proof container if glass fragments are larger); and
 - g. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Arrange the supplies so they can be easily reached.
2. Put on gloves.
3. Sprinkle absorbent granules over spill area and allow to absorb.
4. When all liquid has been absorbed by granules, carefully (using tongs, forceps, or brush) place gel and glass fragments into the dustpan or scoop.
5. Discard glass fragments and gel into the sharps container.
6. Thoroughly mop spill area. If the spill contained blood/body fluids, follow procedures for cleaning spills of blood.
7. Discard disposable equipment and supplies in designated containers.

continues on next page

8. Clean and disinfect equipment used to pick up glass fragments.
9. Remove gloves carefully (avoiding embedded glass fragments) and discard in designated container.
10. Wash and dry your hands thoroughly.

Reporting

1. Notify environmental services of spills of blood or body fluids with incidents that result in broken glass.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	2.1 (H5MAPR0060)

Cleaning Spills or Splashes of Blood or Body Fluids

Level I

Purpose

The purpose of this procedure is to minimize the danger of environmental contamination and the possible spread of bloodborne infections, including the AIDS (HIV) and Hepatitis B (HBV) viruses, to employees and residents while cleaning up spills of blood or body fluid splashes.

Preparation

Assemble the equipment and supplies as needed.

General Guidelines

1. Hands must be washed as soon as practical after an exposure to blood.
2. As all residents' blood and body fluids are considered potentially infectious, all exposures to blood/body fluids must be reported to the Infection Preventionist (or designee) or supervisor.
3. Do not pick up broken glass by hand. Use forceps, tongs, or brush and dustpan.
4. Report spills of blood or body fluids to the Infection Preventionist (or designee) so that an investigation into the cause of the spill can be initiated and the corrective measures identified to prevent similar spills from occurring.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Nonsterile gloves (exam or heavy-duty);
2. Bleach (EPA registered sodium hypochlorite 5.25%);
3. Spray bottle;
4. Water;
5. Cloth or paper towels;
6. Plastic bag (Note: If a red bag is not used, a "biohazard" label must be affixed to the bag);
7. Forceps, tongs, or brush and dustpan (as applicable if picking up broken glass);
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed); and
9. Other as appropriate or as may be needed.

Steps in the Procedure

1. Arrange the supplies so they can be easily reached.
2. Using appropriate personal protective measures, mix and label the following disinfectant solutions:
 - a. One (1) part bleach and ten (10) parts water (written as 1:10); and/or
 - b. One (1) part bleach and one hundred (100) parts water (written as 1:100).
3. Put on nonsterile exam gloves or heavy-duty gloves.
4. If the spill involves large amounts of blood (two cups or more), spray the area with 1:10 disinfectant solution until thoroughly saturated.
5. Use forceps, tongs, or brush and dustpan to pick up broken glass.

continues on next page

6. Place contaminated items, including equipment used to pick up glass fragments, in properly labeled receptacle for decontamination.
7. Wipe up the spill or splash with a cloth or paper towels or use granules to absorb spill.
8. Discard the saturated cloth or paper towels into the plastic “biohazard” bag.
9. Repeat as necessary until the spill or splash area is dry.
10. Disinfect the area by swabbing with a cloth or paper towel which has been moderately saturated with a 1:100 bleach solution. Allow to air dry.
11. Discard the contaminated cleaning cloth or paper towels into the plastic “biohazard” bag.
12. Spray disinfectant solution onto the discarded cloth or paper towels inside the plastic bag.
13. Tie the bag. If the outside of the plastic bag becomes contaminated with blood, body fluids, secretions, or excretions, place the contaminated bag into a clean plastic bag.
14. Place the plastic bag into a designated container for medical waste.
15. Remove gloves and place them into designated container. Wash and dry hands thoroughly.
16. Return unused supplies or equipment to the designated storage areas.
17. Wash and dry your hands thoroughly.

Reporting

1. Notify environmental services of spills of blood or body fluids and/or incidents that result in broken glass.
2. Report other information in accordance with facility policy and professional standards of practice.

Departmental (Environmental Services) – Laundry and Linen

Level I

Purpose

The purpose of this procedure is to provide a process for the safe and aseptic handling, washing, and storage of linen.

General Guidelines

Standard Precautions

1. Separate soiled and clean linen at all times.
2. Wash hands after handling soiled linen and before handling clean linen.
3. Consider all soiled linen to be potentially infectious and handle with standard precautions.

Bagging and Handling Soiled Linen

1. All soiled linen must be placed directly into a covered laundry hamper which can contain the moisture.
2. Do not sort or pre-rinse soiled linens in resident-care areas.
3. Place any linen saturated with blood or body fluids into a leak-resistant bag before placing it into the hamper.
4. Handle soiled linen as little as possible to prevent agitation.
5. If laundry chutes are used, only closed and leak-resistant bags will be put into the chute. Loose items will not be placed in the laundry chute.

Sorting Soiled Linen

1. Employees sorting or washing linen must wear a gown and gloves. A mask may be worn if aerosolization is expected.
2. Use heavy-duty rubber gloves for sorting laundry. Always wash hands after completing the task and removing gloves.
3. A sharps container should be available in the soiled linen sorting area to permit the disposal of any syringes found in the soiled laundry.
4. The _____ is responsible for ensuring that a sharps container is present at all times.
5. Pre-wash briefs, underpads and any other items soiled with feces, using the maximum setting of bleach/ EPA registered germicidal, and then process them through a regular cycle.

Washing Linen and other Soiled Items

1. Laundry may be processed in either low-temperature or high-temperature cycles.
 - a. For high-temperature processing, wash linen in water that is at least 160°F, for a minimum of twenty-five (25) minutes.
 - b. For low-temperature processing, wash linen in water that is at least 71-77°F and use a 125-part-per-million (ppm) chlorine bleach rinse if the material being washed can withstand bleach and remain intact.
 - c. Ozone cleaning systems are also acceptable means of processing laundry.

continues on next page

2. Use any detergent designated for laundry processing and follow manufacturer's instructions. Anti-microbial detergents are not required.
3. Follow any special requests for laundry processing of residents with allergies (hypo-allergenic or unscented detergents, etc.).
4. Do not leave damp linen in washing machines overnight.
5. Follow manufacturer's instructions for all laundry processing materials (equipment, detergents, rinses, etc.) and label items on clothing and linen.
6. Keep soiled and clean linen, and their respective hampers and laundry carts, separate at all times.
7. Clean linen will remain hygienically clean (free of pathogens in sufficient numbers to cause human illness) through measures designed to protect it from environmental contamination, such as covering clean linen carts.
8. Wash mops separately from linens, using the maximum setting of bleach/EPA registered germicidal.
9. Reprocess any linen that is not visibly clean upon completion of the cycle or any linen that falls onto the floor.
10. Leave washing machine doors open when not in use.
11. Remove barrier attire when leaving the soiled linen area.
12. Wash hands before handling clean linen (i.e., when moving from washer to dryer, moving from dryer to sorting table, and through the sorting process).

Departmental (Occupational Therapy) – Prevention of Infection

Level I

Purpose

The purpose of this procedure is to provide guidelines to decrease potential for spread of pathogenic microorganisms which may predispose the resident to nosocomial infection.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Wash hands before direct resident care and especially during nursing care functions.
2. Waterless handwashing agent must be used for hand antisepsis by staff and residents when running water is not available.
3. Residents' hands must be washed before entering the occupational therapy. When residents have lesions, have breaks in the skin on their hands, or cannot use a waterless handwashing agent, gloves must be placed on the residents.
4. Therapists must wash their hands between residents, or use a waterless handwashing agent. When the potential for soiling with a resident's blood/body fluids exists, gloves must be worn.
5. Put on barrier protection (i.e., gloves) as necessary, after determining the likelihood of exposure to blood, body fluids, secretions, excretions, nonintact skin and mucous membranes. During instruction on bathing and toileting activities, there may be potential for exposure, depending on the capabilities of the resident.
6. When therapists are participating with activities of daily living and/or nursing care activities, they must wear barriers appropriate to the individual resident and exposure risk.
7. Personal protective clothing (e.g., gowns, gloves, masks, etc.) used in the performance of occupational therapy functions must be discarded into appropriate receptacles.
8. Work and environmental surfaces must be disinfected with an EPA-approved disinfectant.
9. Occupational therapy equipment must be washed routinely with soap and water and then soaked in a disinfectant solution for ten (10) minutes every week (when being used) and as necessary when visibly soiled.
10. Occupational therapy equipment must be disinfected as above should the equipment come into contact with the resident's blood/body fluids, and after use by a resident on Airborne, Contact or Droplet Isolation Precautions. (**Note:** Caution should be used in the selection of occupational therapy equipment taken to the room of a resident who is known to be on Airborne, Contact or Droplet Isolation Precautions.)
11. Upon completion of feeding using adaptive dishware, send the dishware to the dietary department after performing the following:
 - a. Scrape uneaten food into plastic bag to discard food;
 - b. Rinse dishware;
 - c. Place dishware into clean plastic bag marked with resident's name and room number; and
 - d. Place the dishware on the dietary tray.

continues on next page

12. Adaptive dishware should be marked with the resident's name. Such dishware must be placed on meal trays and returned to the dietary department as any dishes would be after use. The dietary department should wash this dishware and sanitize it in a 50-200 p.p.m. available chlorine solution (1/8-1/2 ounce bleach in one (1) gallon water) for one (1) minute or place in dishwasher.
13. Dietary will be responsible for sanitizing dishware, placing dishware into a clean plastic bag, and returning promptly to the occupational therapy department.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Clear plastic bag;
2. Waterless handwashing agent (as indicated);
3. Disinfectant solution (as indicated);
4. Adaptive dishware (as indicated); and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the occupational therapy was performed.
2. The type of occupational therapy performed.
3. The name and title of the individual(s) who performed the occupational therapy.
4. All assessment data obtained during the occupational therapy.
5. If the resident refused the therapy, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the occupational therapy.
2. Report other information in accordance with facility policy and professional standards of practice.

Departmental (Physical Therapy) – Prevention of Infection Level I

Purpose

The purpose of this procedure is to prevent the spread of infections in the physical therapy department.

Preparation

1. Review the resident's care plan to assess for any special circumstances or precautions related to the resident.
2. Assemble the equipment and supplies needed.

General Guidelines

1. Therapy workers should follow Standard Precautions for all individuals and Contact Precautions if indicated by a resident's condition, physician orders, or appropriate notification from the nursing staff. If unsure, discuss the situation with a Nursing Supervisor or Charge Nurse before treating a resident.
2. Handle all soiled dressings as infectious waste.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Dressings as appropriate and per MD order;
2. Plastic bag or container;
3. Disinfectant (as indicated); and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

Dressing Removal or Change:

1. Wash and dry hands thoroughly.
2. Put on exam gloves.
3. Lift off dressing without having skin contact with the soiled dressing and discard into appropriate receptacle.
4. Handle wet dressings with the no-touch technique or with sterile gloves.
5. Remove gloves and discard into an appropriate receptacle.
6. Wash and dry hands thoroughly.

Whirlpool:

1. Provide whirlpool treatment, as ordered.
2. Remove resident. Drain tank.
3. Wash and dry hands thoroughly.
4. After an individual has used the whirlpool, wash the whirlpool tank with approved disinfectant.
5. Allow turbine to run for ten (10) minutes.
6. Rinse tank thoroughly to remove any chemicals from the tub.

continues on next page

7. Residents with draining wounds, fecal incontinence, or other conditions which present an infection control risk will not ordinarily be treated in whirlpools until their condition(s) is resolved, unless the whirlpool treatment is essential because no other means of adequate wound cleansing is available.
8. After a whirlpool is used to treat residents with the above mentioned conditions, clean and disinfect it as indicated.

Hydroculator:

1. Empty the tank every six (6) months and disinfect it with an approved disinfectant.
2. Place a towel between the resident and any hot pack.
3. Wash hot pack covers when soiled or as indicated.

Paraffin Treatments:

1. Always wash a resident's hands and arms before immersion into paraffin.

Ultrasonic Treatments:

1. Don't perform ultrasonic treatments in areas with broken skin unless specifically reviewed and approved by a physician.
2. Wash hands before and after close contact with the resident's skin.

Tens:

1. Use disposable electrodes on all individuals.

Debridement:

1. Use a sterile suture kit, wear sterile gloves, and use sterile dressings for all debridement.

Documentation

Record the following information in the resident's medical record:

1. The date and time the physical therapy was performed.
2. The type of physical therapy performed.
3. The name and title of the individual(s) who performed the physical therapy.
4. All assessment data obtained during the physical therapy.
5. If the resident refused the therapy, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Departmental (Recreational Therapy) – Prevention of Infection

Level I

Purpose

The purpose of this procedure is to guide the prevention of disease transmission in the Recreational Therapy Department.

Preparation

1. Review the resident's care plan to assess for any special circumstances or precautions related to the resident.
2. Assemble the equipment and supplies needed.

General Guidelines

1. Recreational therapy staff should consult with the Charge Nurse, Nursing Supervisor, or other appropriately knowledgeable staff, before they interact with a resident who has any of the following, or before they take a resident to an activity where he/she may interact with others:
 - a. Fever;
 - b. Diarrhea or vomiting;
 - c. Cold or flu symptoms;
 - d. Rashes or undiagnosed skin conditions;
 - e. Open draining areas not contained within dressings;
 - f. Herpetic lesions;
 - g. Lice or scabies; and/or
 - h. A potentially contagious infection with a multi-drug resistant organism such as Methicillin Resistant Staphylococcus Aureus (MRSA) or others.
2. If a resident has cuts or lesions on his/her hands or other exposed parts of the body, these must be covered (e.g., with an adhesive bandage, gloves, or a dressing) before he/she participates in an activity.
3. A resident's hands must be washed when obviously soiled.
4. Recreational therapy staff should use and discard personal protective clothing (e.g., gown, gloves, masks, etc.) per related policies.

Departmental (Respiratory Therapy) – Prevention of Infection

Level I

Purpose

The purpose of this procedure is to guide prevention of infection associated with respiratory therapy tasks and equipment, including ventilators, among residents and staff.

Preparation

1. Review the resident's care plan to assess for any special circumstances or precautions related to the resident.
2. Assemble the equipment and supplies needed.

General Guidelines

1. Distilled water used in respiratory therapy must be dated and initialed when opened, and discarded after twenty-four (24) hours.
2. Condensate in the breathing circuits must be drained back into waste bottles, which must be marked with the resident's name, and emptied into the toilet or hopper at the end of every shift. Condensate should be considered infectious. Condensate should never be drained back into the breathing circuit or cascade.
3. Transport respiratory therapy equipment to designated soiled utility area for decontamination.

Equipment and Supplies

The following equipment and supplies will be necessary when performing tasks related to this procedure:

1. Appropriate equipment/supplies necessary for ordered therapy;
2. Waterless antiseptic handwash (as indicated); and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

Infection Control Considerations Related to Oxygen Administration

1. Obtain equipment (i.e., oxygen tubing, reservoir, and distilled water).
2. Use distilled water for humidification per facility protocol.
3. Mark bottle with date and initials upon opening and discard after twenty-four (24) hours.
4. Check water levels of refillable humidifier units daily. If the water level falls below the fill line:
 - a. Discard residual solution.
 - b. Pour a small amount of distilled water into the reservoir and swish around to rinse all surfaces.
 - c. Discard water.
 - d. Refill with distilled water to fill line.
 - e. Change the reservoir every forty-eight (48) hours and disinfect with 2% alkaline glutaraldehyde or sterilize.

continues on next page

5. Check water level of any pre-filled reservoir every forty-eight (48) hours.
6. Change pre-filled humidifier when the water level becomes low.
7. Change the oxygen cannulae and tubing every seven (7) days, or as needed.
8. Keep the oxygen cannulae and tubing used PRN in a plastic bag when not in use.
9. Wash filters from oxygen concentrators every seven days with soap and water. Rinse and squeeze dry.
10. Wash hands after manipulation.

Infection Control Considerations Related to Medication Nebulizers/Continuous Aerosol:

1. Obtain equipment (i.e., administration “set-up,” plastic bag, gauze sponges).
2. Wash hands.
3. After completion of therapy:
 - a. Remove the nebulizer container;
 - b. Rinse the container with fresh tap water; and
 - c. Dry on a clean paper towel or gauze sponge.
4. Reconnect to the administration “set-up” when air dried.
5. Take care not to contaminate internal nebulizer tubes.
6. Wipe the mouthpiece with damp paper towel or gauze sponge.
7. Store the circuit in plastic bag, marked with date and resident’s name, between uses.
8. Wash hands.
9. Discard the administration “set-up” every seven (7) days.

Infection Control Considerations Related to Mechanical Ventilators:

1. Obtain appropriate equipment (i.e., breathing circuits (as indicated), sterile water, and waste water bottle).
2. Change the ventilator circuits and cascades every forty-eight (48) hours.
3. Do not disconnect the cascades from the heat supply, even when not in use.
4. Change the cascade reservoir and disinfect using 2% alkaline glutaraldehyde or sterilize it.
5. Fill the cascade with sterile distilled water.
6. When cascades need refilling, discard residual fluid. Pour a small amount of sterile distilled water into the cascade. Swish around to rinse all surfaces. Discard the water and refill with sterile distilled water.
7. Drain condensate from corrugated tubing into waste bottles marked with the resident’s name. Empty bottles into toilet or hopper at the end of the shift, and as necessary. (Note: Never allow condensate to drain back toward resident or into cascade.)
8. When disconnecting tracheostomies from the breathing circuit, direct the mist away from the resident and your face.
9. Check filters once weekly while they are in continuous use. Discard filters or sterilize them between uses for different residents.
10. Clean and disinfect the surface of the ventilator as necessary and between uses for different residents.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the respiratory therapy was performed.
2. The type of respiratory therapy performed.
3. The name and title of the individual(s) who performed the respiratory therapy.
4. All assessment data obtained during the treatment.
5. If the resident refused the therapy, the reason(s) why and what was done as a result.
6. The signature and title of the person recording the information.

Diapers/Underpads

Level II

Purpose

The purpose of this procedure is to provide guidelines for the proper handling of diapers and underpads.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Skin cleansing preparation;
2. Disinfectant; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

In Resident Rooms

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Put on gown or apron if soiling of clothing is likely.
5. Remove diaper or underpad from resident by rolling the diaper/underpad toward the inside soiled area. Contain as much fecal soil as possible.
6. Clean skin of resident and replace fresh diaper or underpad.
7. If fecal material is solid, take the diaper or underpad to the hopper or toilet and let the fecal matter fall, being careful to avoid splashes. Flush the toilet/hopper.
8. Place diaper or underpad into designated hamper/container.
9. Discard disposable equipment and supplies in designated containers.
10. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
11. Clean the overbed table and return it to its proper position.
12. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
13. Reposition the bed covers. Make the resident comfortable.
14. Place the call light within easy reach of the resident.
15. Remove protective clothing before leaving the room. Discard into appropriate receptacles.
16. Wash and dry your hands thoroughly.
17. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

continues on next page

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. All assessment data (e.g., the condition of the resident's skin) obtained while changing the diaper/underpad.
4. If the resident refused the care, the reason(s) why and the intervention taken.
5. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	2.0 (H5MAPR0103)

Diarrhea and Fecal Incontinence

Level II

Purpose

The purpose of this procedure is to provide guidelines that will aid in preventing the resident's exposure to feces.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. When residents have diarrhea or fecal incontinence, and there is a possibility of soiling clothing during clean-up, gowns or aprons should be worn and removed immediately after completing the procedure and placed into the laundry hamper or discarded, as appropriate.
2. Residents must be cleaned after each episode of incontinence.
3. Disposable items soiled with feces (i.e., disposable briefs or disposable underpads) must be handled so as to prevent contamination of the environment with feces. Such items must be placed in closed containers in the soiled utility room and discarded in accordance with established procedures.
4. Cloth briefs and underpads must be placed into assigned linen hampers and washed separately, using a prewash cycle. Solid feces should be dropped into toilet or hopper before placing items into linen hamper.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Brief (disposable or cloth);
2. Underpad (disposable or cloth);
3. Disposable or cloth as designated by resident plan of care.
4. Draw sheet;
5. Soap and water (or incontinence preparation);
6. Barrier creams and lotions (as indicated); and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Put on gown or apron if soiling of clothing is likely.
5. Use high degree of caution when turning residents who are known to be incontinent.
6. Wipe feces from the resident's skin with edge of brief or underpad. Wipe away from the perineum and any indwelling catheters.
7. Wash the resident's skin with soap and water or incontinence preparation.
8. Provide catheter care as indicated, if catheter is soiled with feces.

continues on next page

9. Rinse well and pat dry.
10. Apply barrier creams or lotions as indicated.
11. When evaluating the condition of the resident's skin, note the following:
 - a. Maceration, softening, or breaks in the skin;
 - b. Irritation, chafing, excoriation, or rash; and
 - c. Pressure ulcers.
12. Remove soiled items. Replace with clean dry briefs or underpad, as indicated.
13. Drop solid fecal matter into toilet or hopper and flush.
14. Place disposable brief or underpad into special waste container.
15. Place cloth brief, underpad or draw sheet into designated container.
16. Discard disposable equipment and supplies in designated containers.
17. Remove gown or apron (if worn) and discard into designated container.
18. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
19. Clean the overbed table and return it to its proper position.
20. Lower the bed into lowest position and place the siderails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. Remove protective clothing before leaving the room. Discard into appropriate receptacles.
24. Wash and dry your hands thoroughly.
25. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Guidelines for Preventing Intravenous Catheter-Related Infections

Level III

Purpose

The purpose of this procedure is to maximally reduce the risk of infection associated with indwelling intravenous (IV) catheters.

General Guidelines

1. Facility staff who manage infusion catheters will have training and demonstrated clinical competency in intravenous therapy, including:
 - a. indications for IV catheter use;
 - b. proper procedures for the insertion and maintenance of IV catheters; and
 - c. appropriate infection control measures to prevent IV catheter-related infections.
2. Staff may only insert catheter types for which they have adequate training and demonstrated skill.
3. Aseptic technique shall be observed at all times when working with IV equipment.
4. All infusion equipment shall be sterile when first opened. At all times equipment shall remain aseptic. If it becomes contaminated it must be changed.
5. Resident complaints of pain or problems regarding the catheter or treatment shall be investigated immediately. Interventions shall be initiated as soon as the appropriate measure is identified.

Overview of CRIs

1. Potential risk factors associated with central venous access device (CVAD) and infusion-related infections include:
 - a. catheter dwell time, sutures;
 - b. frequent manipulation of CVAD;
 - c. multi-lumen catheters; and
 - d. presence of immunosuppression.
2. Signs and symptoms that can indicate infection include:
 - a. fever, chills;
 - b. hypotension, hyperventilation;
 - c. altered mental status;
 - d. tenderness at insertion site;
 - e. erythema, induration, purulent drainage;
 - f. positive blood cultures or catheter tip; and
 - g. phlebitis.
3. Infections can be local, systemic, or both.

continues on next page

Nursing Practice Guidelines to Prevent Catheter-Related Infections

Surveillance

1. Observe the insertion site (and sutures if present) on every shift, on admission, and with dressing changes.
2. Observe visually or by palpation through the intact dressing.
3. If signs and symptoms of catheter-related infection are present, contact the Physician.
4. Obtain an order for culture if there are signs of drainage, expanding redness, tenderness at insertion site, and/or fever without obvious source.
5. Cultures may be taken from the site of drainage, the catheter, peripheral blood samples, or any other suspected source as ordered.
6. Any time that dressing is not intact or end caps are missing, the catheter has potential for contamination.
7. The Infection Preventionist is responsible for documenting, reporting, and retaining infection rate statistics.

Hand Hygiene

1. Observe proper hand hygiene procedures either by washing hands with conventional soap and water, or with waterless alcohol-based hand rubs.
2. Observe hand hygiene before and after palpating catheter-insertion sites, as well as before and after inserting, replacing, accessing, repairing, or dressing an IV catheter.
3. Palpate insertion site after hand hygiene and non-sterile gloves are applied.
4. Palpation of the insertion site should not be performed after the application of an antiseptic, unless aseptic technique is maintained.

Selection of IV Catheters

1. Select the appropriate type of catheter to accommodate the resident's vascular access needs based on the intended purpose and duration of use, known infectious and non-infectious complications, and experience of individual catheter operators.
2. Select the smallest and shortest length catheter that will accommodate the prescribed therapy.
3. Select the catheter with the fewest number of lumens possible.
4. Therapies that are not appropriate for peripheral or midline catheters include vesicant therapy, parenteral nutrition, infusate with pH <5 or >9, or osmolality of >600mOsm/L.
5. Use steel winged infusion sets for single dose administration of medication only. These catheters cause vein irritation and cannot be kept in place.
6. Use a midline or PICC catheter if duration of treatment will likely exceed 6 days.
7. Catheters that are placed in the femoral veins are at higher risk of infection due to their proximity to urinary and rectal areas. These catheters require vigilant care and usually have short stay-in-place times.

Aseptic Technique During Catheter Insertion and Care

1. Peripheral short catheters
 - a. Maintain aseptic technique during catheter insertion and care.
 - b. Wear clean gloves when inserting a peripheral IV catheter.
 - c. Wear clean gloves during dressing changes for peripheral catheters.
 - d. Before peripheral catheter insertion, prepare the site with an antiseptic.
 - (1) Use seventy percent (70%) alcohol, alcoholic chlorhexidine gluconate solution, or povidone-iodine tincture for skin antisepsis.
 - (2) Clean the area with a circular motion moving from the insertion site outward, and allow it to air dry.
 - (3) Antiseptics should be left to air dry according the manufacturer's instructions.

continues on next page

2. Midline Catheters
 - a. Wear sterile gloves for the insertion of midline catheters.
3. Central Venous Catheters
 - a. Use maximal sterile barrier precautions (e.g., cap, mask, sterile gown, sterile gloves, and large sterile drape) when inserting or assisting in the insertion of central venous catheters (CVCs).
 - b. Wear sterile gloves for the insertion of arterial and central catheters.
 - c. Maintain sterile technique when changing midline and central catheter dressings or performing site care.
 - d. Remove hair near the insertion site with scissors or electric clippers, not razors, before catheter is inserted (hair removal requires resident consent).
 - e. Before central venous catheter and peripheral arterial catheter insertion and during dressing changes, prepare the site with >0.5% chlorhexidine preparation with alcohol. (If there is a contraindication to chlorhexidine, use tincture of iodine, an iodophor, or 70% alcohol as an alternative.)
 - f. Avoid using the femoral vein for central venous access.
4. Use only one catheter for each cannulation attempt.
5. Do not attempt more than two catheter insertions per Nurse.

Catheter Site Dressing Regimens

1. Change initial dressing after catheter placement within 24 hours.
2. Use either sterile gauze or sterile transparent, semi permeable membrane (TSM) to cover central or peripheral catheter sites.
3. If the patient is diaphoretic or the site is bleeding or oozing, use gauze dressing until resolved.
4. Change TSM dressings on CVADs every 5-7 days or PRN if damp, loosened, or visibly soiled. This does not require a physician's order.
5. Do not use antibiotic ointments or creams on the insertion site.
6. Gauze dressings covered with TSM dressing should be considered a gauze dressing and changed at least every 48 hours.
7. Change the TSM dressing on a peripheral short catheter when site is rotated or compromised.
8. Replace transparent dressings on tunneled or implanted CVCs every 5-7 days, unless the dressing is loose or soiled.
9. Chlorhexidine-impregnated sponge dressing is recommended for temporary, short-term catheters if the central line associated bloodstream infection (CLABSI) rate is not decreasing despite adherence to basic prevention measures (i.e., skin antisepsis, education, training).
10. Monitor the catheter site visually during dressing changes. Palpate catheter-skin junction site for tenderness at least daily through the intact dressing.
11. Do not use topical antibiotic ointments or creams on insertion sites.
12. Do not submerge the catheter or catheter site in water. Patients may shower if the catheter and connecting device can be protected with an impermeable cover. If the dressing becomes wet, change immediately.

Replacement of IV Catheters

1. Promptly obtain physician order for the removal of any peripheral or central IV catheter that is no longer essential.
2. Remove a peripheral venous catheter if the resident develops signs of phlebitis or infection, or if the catheter malfunctions.
3. A peripheral short catheter can stay in place up to 96 hours in an adult resident unless there is suspected contamination, complication, or if therapy is discontinued.

continues on next page

4. If catheter is left in place longer than 96 hours, obtain a physician's order to keep catheter in place and document rationale for leaving the catheter in place.
5. If a catheter is placed under emergency conditions, and aseptic technique cannot be ensured, replace the catheter as soon as possible (within 48 hours).
6. Do not routinely replace midline catheters, CVC or arterial catheters solely for the purpose of reducing the incidence of infection.
7. Any time the resident complains of discomfort or pain related to the catheter, or there are signs and symptoms of complications, assess the resident and catheter site and intervene as appropriate. CVCs and PICCs should not be removed on the basis of fever alone.
8. If a catheter-related bloodstream infection is suspected and a culture is ordered, cultures of catheter and site are obtained before removing catheter.
9. Removal of a midline or any central line is to be performed upon the order of a Physician or authorized prescriber in accordance with state Nurse Practice Act.
10. Never re-advance a catheter that is found out of place.
11. When a new site is selected for cannulation, the site should be proximal to the previous site.
12. Remove midlines or central lines if tip has incorrect placement.
13. Remove catheters at the end of a treatment if there are no further plans for use of the catheter.

Replacement of Administration Sets, Needleless System Equipment

1. Administration Set Replacement
 - a. Replace administration sets whenever the peripheral site is rotated.
 - b. Change continuous primary and secondary administration sets (used for fluids other than blood, blood products, or lipids) no more frequently than every 96 hours, unless there is suspected contamination, or when integrity of the product or system has been compromised.
 - c. Change intermittent sets every 24 hours, immediately upon suspected contamination, or when integrity of product or system has been compromised.
 - d. Once a secondary administration set (piggyback) is detached from the primary set, it is considered an intermittent set.
 - e. Change lipid-containing parenteral nutrition sets at least every 24 hours, when new bag is started, immediately upon suspected contamination, or when the integrity of the product or system has been compromised.
 - f. Change administration sets and add on filters that are used for blood or blood components after administration of each unit or at the end of 4 hours, whichever comes first.
 - g. Discard sets found without a sterile cap on the end of the tubing, or if not labeled.
2. Replacement of the Needleless System Equipment
 - a. Use aseptic technique and observe standard precautions when changing all add-on devices. Add-on devices include, but are not limited to, stopcocks, extension sets, manifold set, extension loops, solid cannula caps, injection/access caps, filters, and any other needleless system equipment.
 - b. Change needleless connection devices if there is blood or debris in the connector, before obtaining blood samples for culture, after blood draws, upon contamination, and in accordance with manufacturer recommendations.
 - c. Change stabilization devices per manufacturer recommendation, usually weekly with dressing change.
 - d. Change filters that are used with medication administration sets with each new dose of medication that is administered.
 - e. Use new extension tubing with any new peripheral short catheter placement.

continues on next page

Cleaning Needleless Connection Devices

1. Keep administration sets and needleless devices aseptic between medication dosages.
2. Disinfect the needleless connector prior to each access using alcohol, tincture of iodine, or chlorhexidine gluconate/alcohol combination.

Preparation and Quality Control of IV Admixtures

1. Do not use any container of parenteral fluid that is visibly cloudy (turbid) or has leaks, cracks, or particulate matter, or if the manufacturer's expiration date has passed.
2. If any IV system is discarded because of suspected fluid contamination, the fluid should be cultured and the implicated bottle saved. If contamination is confirmed, notify the Infection Preventionist. The Infection Preventionist will report contamination that may be related to the manufacturing process to the local health department, Centers for Disease Control, and the U.S. Food and Drug Administration.
3. Use single-dose vials for parenteral additives or medications when practical. Do not combine leftover content of single-use vials for later use.
4. Vials labeled "single dose" or "single use" will not be used on multiple residents. Such vials will be used only for one resident in a single procedure.
5. Refrigerate multi-dose vials after they are opened, if recommended by the manufacturer.
6. Cleanse the access diaphragm of multi-dose vials with alcohol wipe before inserting a device into the vial.
7. Use a sterile device to access a multi-dose vial and avoid contaminating the device or the access diaphragm before penetrating. Discard a multi-dose vial if sterility is compromised.
8. When mixing medications in the facility, do so in an area that is away from traffic. A medication room with a door that closes is preferred. Clean countertop area with soap and water, alcohol, or use waterproof barrier. Use aseptic technique while mixing medicine.

Multi-Lumen Catheters

1. A catheter with the fewest number of lumens possible should be used for the infusion management of the resident.
2. Each lumen is a separate catheter. Flush each lumen at least once every 24 hours to avoid blood clot formation.
3. If catheter is found to have clotted blood in lumens or if catheter is found without needleless connection devices (end cap) or sterile dressing, the catheter should be considered contaminated and replacement is recommended.
4. Consider labeling each lumen as to purpose, to avoid cross contamination and medication interaction.
5. Follow manufacturer recommendations or facility policy for purpose and use of lumens.

Documentation

The following information should be recorded in the resident's medical record:

1. Objective information regarding appearance of insertion site, catheter, and dressing.
2. Any interventions that were done (dressing change, cultures, etc.).
3. Results of any laboratory tests, cultures.
4. Communication with Physician, Supervisor, oncoming shift.

continues on next page

Reporting

1. Report objective information, lab results, and interventions to Supervisor, Physician, and oncoming shift.
2. Report any infection control information to Infection Preventionist, pharmacy, federal agencies if needed.

Medical Waste, Handling of

Level I

Purpose

The purpose of this procedure is to provide a definition of and guidelines for the safe and appropriate handling of medical waste.

Preparation

1. Assemble the equipment and supplies as needed.

General Guidelines

1. For the purpose of this policy, medical waste includes human blood and blood-soiled articles, contaminated items (i.e., soiled dressings), items contaminated with feces from a person diagnosed as having a disease that is transmitted through feces, and disposable sharps (i.e., needles/scalpels).
2. All sharps must be handled as medical waste, placed in approved sharps containers, and sent for eventual incineration.
3. Liquid blood, excretions, and secretions shall be flushed into the sewer system.
4. Disposable items, which are contaminated with excretions or secretions from residents believed to be infectious, must be placed in red plastic bags and sealed, and either decontaminated with bleach (1:10 or 1:100 dilution), incinerated, or stored until removal from the premises.
5. Disposable items soiled with visible blood (or feces from a resident with a disease transmitted through feces) must be placed in red plastic bags or containers, and a solution of one (1) part bleach and nine (9) parts water added to saturate the items or the items must be incinerated.
6. Outside of compactor/dumpster must be locked when not in use and at night.
7. Only authorized vendors are permitted to collect regulated wastes.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sharps container;
2. Red plastic bag;
3. Bleach solution;
4. "BIOHAZARD" label (if red bags or containers are not used); and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Version	1.2 (H5MAPR0083)

Needle Handling and/or Disposal

Level I

Purpose

To guide the safe handling and disposal of used needles.

Objectives

To prevent needlestick injuries and exposure to the HIV (AIDS) and hepatitis B (HBV) viruses or other bloodborne infections through contact with blood or tissues.

Equipment and Supplies

1. Needle box;
2. Recapping device (if a needle box is not available);
3. Gloves (as indicated); and
4. Other as necessary or appropriate.

Safety Precautions

1. After using a needle, if the needle disposal box is directly available, discard the needle without recapping.
2. Place used needles in the needle disposal box. Do not bend, break, or cut needles. When the disposal box is three-quarter filled or at fill line seal the box and store it in a closed, puncture-resistant container marked "Biohazard" until incinerated or picked up by a licensed vendor for proper disposal.
3. Do not discard used or unused needles into trash receptacles.
4. In the event of a needlestick injury, the employee should:
 - a. Immediately wash the wound vigorously with soap and running water;
 - b. If desired, apply alcohol or hydrogen peroxide to the wound; and
 - c. Notify the supervisor or Infection Preventionist of the incident as soon as practical.

Personal Protective Equipment – Contingency and Crisis Use of Eye Protection (COVID-19 Outbreak)

Level I

Purpose

To guide the use of personal protective equipment (PPE) through contingency and crisis capacity strategies when supply is limited.

Objective

To prevent transmission of infectious agents through the use of personal protective equipment.

Equipment and Supplies

1. Eye protection; and
2. Additional PPE as required (e.g., gloves, masks and gowns).

Managing the Supply of PPE

1. Inventory of PPE is managed systematically, based on the facility calculations for [PPE Burn Rate](#).
2. The inventory and supply chain for PPE are established and managed by: _____
3. The facility maintains ongoing communication with local, state and federal public health and disaster preparedness agencies, and healthcare coalitions during surge situations regarding identification of additional supplies.

Optimizing the Supply of PPE:

1. During surges in demand for PPE, the facility reverts to [Strategies for Optimizing the Supply of PPE](#).
2. The Centers for Disease Control and Prevention organizes these strategies according to capacity:
 - a. Conventional Capacity – every day strategies that optimize PPE supplies based on the conventional PPE use rate for the facility.
 - b. Contingency Capacity – measures that are employed during temporary periods of shortage but do not have a significant impact on the care of patients or the safety of healthcare personnel (HCP).
 - c. Crisis Capacity – measures that are not commensurate with standards of care but may need to be employed during periods of known shortages.
3. Contingency and/or crisis capacity measures are implemented after administrative and engineering measures are employed, for example:
 - a. Temporarily halting or reducing the number of new admissions to the facility;
 - b. Reducing the number of face-to-face encounters with residents;
 - c. Limiting or excluding non-essential healthcare personnel and personnel not directly involved in resident care;
 - d. Excluding visitors;
 - e. Cohorting residents (grouping together residents who are infected with the same organism to confine their care to one area);

continues on next page

- f. Cohorting healthcare personnel (assigning designated teams of HCP to provide care for all residents with suspected or confirmed COVID-19);
- g. Providing training and assessing competency of staff utilizing PPE; and
- h. Maximizing the use of telemedicine.

Eye Protection: Contingency Capacity

1. Selectively cancel elective and non-urgent procedures for which protective eyewear is typically used by HCP.
2. Shift eye protection supplies from disposable to re-usable devices (i.e., goggles and reusable face shields).
 - a. Consider preferential use of powered air purifying respirators (PAPRs) or full-face elastomeric respirators which have built-in eye protection.
 - b. Ensure appropriate cleaning and disinfection between users if goggles or reusable face shields are used.
3. Implement extended use of eye protection.
 - a. Remove and reprocess eye protection if it becomes visibly soiled or difficult to see through.
 - (1) If a disposable face shield has been reprocessed, dedicate to one HCP and reprocess whenever it is visibly soiled or removed (e.g., when leaving the isolation area) prior to putting it back on.
 - (2) See **Protocol for Removing and Reprocessing Eye Protection** below.
 - b. Discard eye protection if damaged (e.g., face shield can no longer fasten securely to the provider, if visibility is obscured and reprocessing does not restore visibility).
 - c. Take care not to touch eye protection. Perform hand hygiene immediately after touching or adjusting eye protection.
 - d. Leave patient care area before removing eye protection. See **Protocol for Removing and Reprocessing Eye Protection** below.

Eye Protection: Crisis Capacity

1. Cancel all elective and non-urgent procedures and appointments for which a gown is typically used by HCP.
2. Use eye protection devices beyond the manufacturer-designated shelf life during resident care activities.
 - a. If there is no date available on the eye protection device label or packaging, contact the manufacturer.
 - b. The user should visually inspect the product prior to use and, if there are concerns (such as degraded materials), discard the product.
3. Prioritize eye protection for selected activities such as:
 - a. During care activities where splashes and sprays are anticipated, which typically includes aerosol generating procedures; and/or
 - b. During activities where prolonged face-to-face or close contact with a potentially infectious resident is unavoidable.
4. Consider using safety glasses (e.g., trauma glasses) that have extensions to cover the side of the eyes.
5. Exclude HCP at higher risk for severe illness from COVID-19 from contact with known or suspected COVID-19 patients.
 - a. During severe resource limitations, consider excluding HCP who may be at higher risk for severe illness from COVID-19, such as those of older age, those with chronic medical conditions, or those who may be pregnant, from caring for patients with confirmed or suspected COVID-19 infection.

continues on next page

6. Designate convalescent HCP for provision of care to known or suspected COVID-19 patients.
 - a. It may be possible to designate HCP who have clinically recovered from COVID-19 to preferentially provide care for additional patients with COVID-19. Individuals who have recovered from COVID-19 infection may have developed some protective immunity, but this has not yet been confirmed.

Protocol for Removing and Reprocessing Eye Protection

1. Adhere to recommended manufacturer instructions for cleaning and disinfection.
2. When manufacturer instructions for cleaning and disinfection are unavailable, such as for single use disposable face shields, consider:
 - a. While wearing clean gloves, carefully wipe the inside, followed by the outside of the face shield or goggles using a clean cloth saturated with neutral detergent solution or cleaner wipe.
 - b. Carefully wipe the outside of the face shield or goggles using a wipe or clean cloth saturated with EPA-registered hospital disinfectant solution.
 - c. Wipe the outside of face shield or goggles with clean water or alcohol to remove residue.
 - d. Fully dry (air dry or use clean absorbent towels).
 - e. Remove gloves and perform hand hygiene.

General Procedure for Donning and Doffing Protective Eyewear

1. To put on eyewear, place over face and eyes and adjust to fit.
2. To remove eyewear:
 - a. Outside of goggles or face shield are contaminated! If your hands get contaminated during goggle or face shield removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - b. Remove goggles or face shield from the back by lifting head band or ear pieces.
 - c. If the item is reusable, place in designated receptacle for reprocessing. Otherwise, discard in a waste container.
 - d. Perform hand hygiene.

Personal Protective Equipment – Contingency and Crisis Use of Facemasks (COVID-19 Outbreak)

Level I

Purpose

To guide the use of personal protective equipment (PPE) through contingency and crisis capacity strategies when supply is limited.

Objective

To prevent transmission of infectious agents through the inhalation of droplets.

Equipment and Supplies

1. Surgical facemasks; and
2. Additional PPE as required (gloves, gown and eyewear).

Managing the Supply of PPE

1. Inventory of PPE is managed systematically, based on the facility calculations for [PPE Burn Rate](#).
2. The inventory and supply chain for PPE are established and managed by: _____
3. The facility maintains ongoing communication with local, state and federal public health and disaster preparedness agencies, and healthcare coalitions during surge situations regarding identification of additional supplies.

Optimizing the Supply of PPE:

1. During surges in demand for PPE, the facility reverts to [Strategies for Optimizing the Supply of PPE](#).
2. The Centers for Disease Control and Prevention organizes these strategies according to capacity:
 - a. Conventional Capacity – every day strategies that optimize PPE supplies based on the conventional PPE use rate for the facility.
 - b. Contingency Capacity – measures that are employed during temporary periods of shortage but do not have a significant impact on the care of patients or the safety of healthcare personnel (HCP).
 - c. Crisis Capacity – measures that are not commensurate with standards of care but may need to be employed during periods of known shortages.
3. Contingency and/or crisis capacity measures are implemented after administrative and engineering measures are employed, for example:
 - a. temporarily halting or reducing the number of new admissions to the facility;
 - b. reducing the number of face-to-face encounters with residents;
 - c. limiting or excluding non-essential healthcare personnel and personnel not directly involved in resident care;
 - d. excluding visitors;
 - e. cohorting residents (grouping together residents who are infected with the same organism to confine their care to one area);

continues on next page

- f. cohorting healthcare personnel (assigning designated teams of HCP to provide care for all residents with suspected or confirmed COVID-19); and/or
- g. providing training and assessing competency of staff utilizing PPE.

Facemasks: Contingency Capacity

1. Selectively cancel elective and non-urgent procedures for which a facemask is typically used by HCP.
2. Remove facemasks for visitors in public areas.
3. Implement extended use of face masks:
 - a. Wear the same face mask for repeated or consecutive close contacts with different residents, without removing the face mask between resident encounters.
 - b. Remove the face mask and discard it if soiled, damaged or hard to breathe through.
 - (1) If experiencing difficulty breathing, remove the mask temporarily.
 - (2) Leave the resident care areas if mask is removed.
 - c. Do not touch face mask while wearing it. If mask is touched or adjusted at any time, hand hygiene must be performed immediately.

Facemasks: Crisis Capacity

1. Cancel all elective and non-urgent procedures and appointments for which a facemask is typically used by HCP.
2. Use facemasks beyond the manufacturer-designated shelf life during patient care activities.
 - a. If there is no date available on the facemask label or packaging, contact the manufacturer.
 - b. Visually inspect the product prior to use and, if there are concerns (such as degraded materials or visible tears), discard the product.
3. Implement limited re-use of facemasks.
 - a. Limited re-use of facemasks is the practice of using the same facemask by one HCP for multiple encounters with different residents with periods of removing and properly storing the mask between uses.
 - b. As it is unknown what the potential contribution of contact transmission is for SARS-CoV-2, care should be taken to ensure that HCP do not touch outer surfaces of the mask during care, and that mask removal and replacement be done in a careful and deliberate manner.
 - c. The facemask should be removed and discarded if soiled, damaged, or hard to breathe through.
 - d. Not all facemasks can be re-used.
 - (1) Facemasks that fasten to the provider via ties may not be able to be undone without tearing and should be considered only for extended use, rather than re-use.
 - (2) Facemasks with elastic ear hooks may be more suitable for re-use.
 - e. HCP should leave patient care area if they need to remove the facemask.
 - f. Facemasks should be carefully folded so that the outer surface is held inward and against itself to reduce contact with the outer surface during storage. The folded mask can be stored between uses in a clean sealable paper bag or breathable container.
4. Prioritize facemasks for selected activities such as:
 - a. for provision of essential surgeries and procedures;
 - b. during care activities where splashes and sprays are anticipated;
 - c. during activities where prolonged face-to-face or close contact with a potentially infectious patient is unavoidable; or
 - d. for performing aerosol generating procedures, if N95 respirators are no longer available.

continues on next page

When No Facemasks are Available:

1. Exclude HCP at higher risk for severe illness from COVID-19 from contact with known or suspected COVID-19 residents.
2. Designate convalescent HCP (personnel who have clinically recovered) for provision of care to known or suspected COVID-19 residents. Individuals who have recovered from COVID-19 infection may have developed some protective immunity, but this has not yet been confirmed.
3. Use a face shield that covers the entire front (that extends to the chin or below) and sides of the face with no facemask.
4. Consider use of expedient isolation rooms for risk reduction (See [Methods for Temporary Negative Pressure Isolation](#)).
5. Consider use of ventilated headboards.
6. HCP use of homemade masks:
 - a. In settings where facemasks are not available, HCP might use homemade masks (e.g., bandana, scarf) for care of patients with COVID-19 as a last resort. However, homemade masks are not considered PPE, since their capability to protect HCP is unknown.
 - b. Caution should be exercised when considering this option.
 - c. Homemade masks should ideally be used in combination with a face shield that covers the entire front (that extends to the chin or below) and sides of the face.

General Procedure for Donning and Doffing Masks

1. To put on mask:
 - a. When donning the face mask, do so immediately after hand hygiene.
 - b. Be sure that the face mask covers the nose and mouth while wearing.
 - c. Do not hang the face mask around the neck.
 - d. After touching a facemask or before changing a face mask, perform hand hygiene.
 - e. Do not remove the mask while performing treatment or services for a resident.
 - f. Handle a mask only by the elastic ear loops.
 - g. Refrain from touching the mask while it is in use.
2. To remove mask:
 - a. Front of mask is contaminated — DO NOT TOUCH. If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - b. Grasp bottom ties or elastics of the mask, then the ones at the top, and remove without touching the front.
 - c. Discard in a waste container.

Personal Protective Equipment – Contingency and Crisis Use of Isolation Gowns (COVID-19 Outbreak)

Level I

Purpose

To guide the use of personal protective equipment (PPE) through contingency and crisis capacity strategies when supply is limited.

Objective

To prevent transmission of infectious agents through the use of personal protective equipment.

Equipment and Supplies

1. Isolation gowns; and
2. Additional PPE as required (e.g., gloves, masks and eyewear).

Managing the Supply of PPE

1. Inventory of PPE is managed systematically, based on the facility calculations for [PPE Burn Rate](#).
2. The inventory and supply chain for PPE are established and managed by: _____.
3. The facility maintains ongoing communication with local, state and federal public health and disaster preparedness agencies, and healthcare coalitions during surge situations regarding identification of additional supplies.

Optimizing the Supply of PPE:

1. During surges in demand for PPE, the facility reverts to [Strategies for Optimizing the Supply of PPE](#).
2. The Centers for Disease Control and Prevention organizes these strategies according to capacity:
 - a. Conventional Capacity – every day strategies that optimize PPE supplies based on the conventional PPE use rate for the facility.
 - b. Contingency Capacity – measures that are employed during temporary periods of shortage but do not have a significant impact on the care of patients or the safety of healthcare personnel (HCP).
 - c. Crisis Capacity – measures that are not commensurate with standards of care but may need to be employed during periods of known shortages.
3. Conventional capacity strategies utilized to maximize the supply of gowns include:
 - a. Use non-sterile, disposable isolation gowns for routine care of residents with suspected or confirmed COVID-19.
 - b. If gown shortages are anticipated, prioritize the use of surgical gowns for surgical and other sterile procedures.
4. Contingency and/or crisis capacity measures are implemented after administrative and engineering measures are employed, for example:
 - a. Temporarily halting or reducing the number of new admissions to the facility;
 - b. Reducing the number of face-to-face encounters with residents;

continues on next page

- c. Limiting or excluding non-essential healthcare personnel and personnel not directly involved in resident care;
- d. Excluding visitors;
- e. Cohorting residents (grouping together residents who are infected with the same organism to confine their care to one area);
- f. Cohorting healthcare personnel (assigning designated teams of HCP to provide care for all residents with suspected or confirmed COVID-19);
- g. Providing training and assessing competency of staff utilizing PPE; and
- h. Maximizing the use of telemedicine.

Isolation Gowns: Contingency Capacity

1. Selectively cancel elective and non-urgent procedures for which a gown is typically used by HCP.
2. Shift gown use toward cloth isolation gowns.
 - a. Reusable (washable) gowns made of polyester or polyester-cotton fabrics can be laundered according to routine procedures and reused.
 - b. Do not touch the outer surfaces of gowns during resident care.
 - c. Augment laundry personnel to compensate for additional laundry processing demands.
 - d. Inspect and maintain reusable gowns and replace when thin, ripped, or otherwise compromised.
3. Consider the use of coveralls.
 - a. Coveralls (drapes) cover the body 360 degrees, including the back and lower legs.
 - b. Level of protection is determined by the material use in the garment, as well as by the seam barriers, and closures.
 - c. Train personnel on the donning and use of coveralls before use.
4. Use gowns beyond the designated shelf life, if indicated by the manufacturer. If no shelf life date is on the packaging, contact the manufacturer.
5. Use gowns and coveralls that conform to international standards of use, possibly reserving these for activities that involve moderate to high amounts of blood or bodily fluids.

Isolation Gowns: Crisis Capacity

1. Cancel all elective and non-urgent procedures and appointments for which a gown is typically used by HCP.
2. Extend use of isolation gowns so that same gown is worn by the same HCP when interacting with more than one resident known to be infected with the same infectious disease, and when these residents are cohorted.
 - a. Do not use this strategy if residents have additional infections that can be transmitted by contact.
 - b. Remove and discard the gown if it becomes visibly soiled or damaged.
3. Re-use cloth non-visibly soiled cloth isolation gowns without laundering in-between.
4. Prioritize gowns for the following activities:
 - a. Surgical and sterile procedures;
 - b. Aerosol-generating activities;
 - c. High-contact resident care activities, including dressing, bathing, showering, assisting with hygiene or toileting, changing linens or briefs, device usage, device care or wound care; and
 - d. Temporarily suspend the use of gowns for endemic multi-drug resistant organisms.

continues on next page

When No Gowns Are Available

1. In situations of severely limited or no available isolation gowns, the following pieces of clothing can be considered as a last resort for care of COVID-19 patients as single use:
 - a. Disposable laboratory coats;
 - b. Reusable (washable) hospital/patient gowns;
 - c. Reusable (washable) laboratory coats;
 - d. Disposable aprons;
 - e. Combinations of clothing:
 - (1) Long sleeve aprons in combination with long sleeve patient gowns or laboratory coats;
 - (2) Open back gowns with long sleeve patient gowns or laboratory coats; and
 - (3) Sleeve covers in combination with aprons and long sleeve patient gowns or laboratory coats.
2. Augment laundry personnel to compensate for additional laundry processing demands.
3. Establish a system to inspect and maintain reusable gowns and replace when thin, ripped, or otherwise compromised.

General Procedure for Donning and Doffing Gowns

1. To put on gown:
 - a. Fully cover torso from neck to knees, arms to end of wrists, and wrap around the back.
 - b. Fasten in back of neck and waist.
2. To remove gown:
 - a. Gown front and sleeves are contaminated. If your hands get contaminated during gown removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - b. Unfasten gown ties, taking care that sleeves don't contact your body when reaching for ties.
 - c. Pull gown away from neck and shoulders, touching inside of gown only.
 - d. Turn gown inside out.
 - e. Fold or roll into a bundle and discard in a waste container.
 - f. Perform hand hygiene immediately.

Personal Protective Equipment – Contingency and Crisis Use of N-95 Respirators (COVID-19 Outbreak)

Level I

Purpose

To guide the use of personal protective equipment (PPE) through contingency and crisis capacity strategies when supply is limited.

Objective

To prevent transmission of infectious agents through the inhalation of airborne particles or droplet nuclei.

Equipment and Supplies

1. Respirator masks (disposable N95 filtering facepiece respirators); and
2. Additional PPE as required (gloves, gown and eyewear).

Managing the Supply of PPE

1. Inventory of PPE is managed systematically, based on the facility calculations for [PPE Burn Rate](#).
2. The inventory and supply chain for PPE are established and managed by: _____
3. The facility maintains ongoing communication with local, state and federal public health and disaster preparedness agencies, and healthcare coalitions during surge situations regarding identification of additional supplies.

Optimizing the Supply of PPE:

1. During surges in the demand for PPE, the facility reverts to [Strategies for Optimizing the Supply of PPE](#).
2. The Centers for Disease Control and Prevention organizes these strategies according to capacity:
 - a. Conventional Capacity – every day strategies that optimize PPE supplies based on the conventional PPE use rate for the facility.
 - b. Contingency Capacity – measures that are employed during temporary periods of shortage but do not have a significant impact on the care of patients or the safety of healthcare personnel (HCP).
 - c. Crisis Capacity – measures that are not commensurate with standards of care but may need to be employed during periods of known shortages.
3. Contingency and/or crisis capacity measures are implemented after administrative and engineering measures are employed, for example:
 - a. Temporarily halting or reducing the number of new admissions to the facility;
 - b. Reducing the number of face-to-face encounters with residents;
 - c. Limiting or excluding non-essential healthcare personnel and personnel not directly involved in resident care;
 - d. Excluding visitors;
 - e. Cohorting residents (grouping together residents who are infected with the same organism to confine their care to one area);

continues on next page

- f. Cohorting healthcare personnel (assigning designated teams of HCP to provide care for all residents with suspected or confirmed COVID-19);
- g. Using surgical N95 respirators only for HCP who need protection from both airborne and fluid hazards (e.g., splashes, sprays). If needed but unavailable, using face shield over standard N95 respirator;
- h. Use alternatives to N95 respirators where feasible (e.g., other disposable filtering face piece respirators, elastomeric respirators with appropriate filters or cartridges, powered air purifying respirators); and
- i. Providing training and assessing competency of staff utilizing PPE. Optimization strategies for training and fit testing N95 Respirators includes:
 - (1) Training HCP on indications and proper use of N95 respirators (i.e., fit, donning and doffing, etc.).
 - (2) Implementing just-in-time fit testing (planning larger scale evaluation, training, and fit testing of employees when necessary during a pandemic).
 - (3) Limiting respirators during training: Determine which HCP do and do not need to be in a respiratory protection program and, when possible, allow limited re-use of respirators by individual HCP for training and then fit testing.
 - (4) Implementing qualitative fit testing to assess adequacy of a respirator fit to minimize destruction of N95 respirator used in fit testing and allow for limited re-use by HCP.

N95 Respirators: Contingency Capacity

1. Use N95 respirators beyond the manufacturer-designated shelf life for training and fit testing.
2. Temporarily suspend annual fit testing per [interim guidance from OSHA](#).
3. Extend the use of N95 respirators by wearing the same N95 for repeated close contact encounters with several different residents, without removing the respirator. (See: recommended guidance on implementation of extended use: <https://www.cdc.gov/niosh/topics/hcwcontrols/recommendedguidanceextuse.html>.)
4. To reduce the risk of contact transmission after donning:
 - a. Discard N95 respirators following use during aerosol generating procedures.
 - b. Discard N95 respirators contaminated with blood, respiratory or nasal secretions, or other bodily fluids from residents.
 - c. Discard N95 respirators following close contact with, or exit from, the care area of any resident co-infected with an infectious disease requiring contact precautions.
 - d. Consider use of a cleanable face shield (preferred³) over an N95 respirator and/or other steps (e.g., masking residents, use of engineering controls) to reduce surface contamination.
 - e. Perform hand hygiene with soap and water or an alcohol-based hand sanitizer before and after touching or adjusting the respirator (if necessary for comfort or to maintain fit).
5. To maintain product integrity:
 - a. Follow the manufacturer's user instructions, including conducting a user seal check.
 - b. Follow the employer's maximum number of donnings (or up to five if the manufacturer does not provide a recommendation) and recommended inspection procedures.
 - c. Discard any respirator that is obviously damaged or becomes hard to breathe through.
 - d. Pack or store respirators between uses so that they do not become damaged or deformed.
6. Do not share respirators between users. N95 Respirators must only be used by a single user.
 - a. Label containers used for storing respirators or label the respirator itself (e.g., on the straps between uses with the user's name to reduce accidental usage of another person's respirator).

continues on next page

N95 Respirators: Crisis Capacity (when N95 Respirators are Running Low)

1. Use respirators as identified by CDC as performing adequately for healthcare delivery [beyond the manufacturer designated shelf life](#).
2. Use respirators approved under standards used in other countries that are similar to NIOSH-approved respirators.
3. Implement limited re-use of N95 respirators by one HCP for multiple encounters with different residents, but remove it after each encounter.
4. Use additional respirators identified by CDC as NOT performing adequately for healthcare delivery beyond the manufacturer-designated shelf life.
5. Prioritize the use of N95 respirators and facemasks by activity type with and without masking symptomatic residents.

When No N95 Respirators are Available:

1. Exclude HCP at higher risk for severe illness from COVID-19 such as those of older age, those with chronic medical conditions, or those who may be pregnant from contact with known or suspected COVID-19 residents.
2. Designate convalescent HCP for provision of care to known or suspected COVID-19 residents (those who have clinically recovered from COVID-19 and may have some protective immunity) to preferentially provide care.
3. Use an [expedient resident isolation](#) room for risk-reduction.
4. Use a ventilated headboard to decrease risk of HCP exposure to a resident-generated aerosol.
5. Use masks not evaluated or approved by NIOSH or improvised masks as a last resort.

Procedure for Donning and Doffing N95 Respirator Masks

1. To put on an N95 respirator mask:
 - a. Secure ties or elastic bands at middle of head and neck.
 - b. Fit flexible band to nose bridge and fit mask snug to face and below chin.
 - c. Fit-check respirator.
2. To remove N95 respirator mask:
 - a. Front of mask/respirator is contaminated — DO NOT TOUCH. If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - b. Grasp bottom ties or elastics of the mask/respirator, then the ones at the top, and remove without touching the front.
 - c. Discard in a waste container.
 - d. Perform Hand hygiene immediately.

Personal Protective Equipment – Using Face Masks

Level I

Purpose

To guide the use of masks.

Objectives

1. To prevent transmission of infectious agents through the air;
2. To protect the wearer from inhaling droplets;
3. To prevent transmission of some infections that are spread by direct contact with mucous membranes;
4. To prevent the splashing of blood or body fluids into the mouth or nose; and
5. To prevent exposure to the HIV(AIDS) and hepatitis B viruses from blood or body fluids.

Equipment and Supplies

1. High-efficiency disposable masks; or
2. Cotton gauze or paper tissue masks; and
3. Eyewear (e.g., goggles). (Note: When the use of a mask is indicated, appropriate eyewear must also be worn.)

Miscellaneous

1. Put the mask on before entering the room, and after cleaning hands.
2. Be sure that face mask covers the nose and mouth while performing treatment or services for the patient.
3. If the face mask becomes wet, change it. Masks become ineffective when moist.
4. Do not hang the face mask around the neck.
5. Before changing a face mask, wash hands.
6. Do not remove the mask while performing treatment or services for the patient.
7. Use a mask only once and then discard it.
8. Handle mask only by the strings (ties).
9. Never touch the mask while it is in use.
10. Follow established handwashing techniques.

When to Use a Mask

1. When providing treatment or services to a patient who has a communicable respiratory infection;
2. When providing treatment or services to a patient and the use of a mask is indicated; and
3. When performing a task that may involve the splashing of blood or body fluids into the mouth or nose.

Procedure Guidelines

Putting on the Mask

1. Obtain a mask.
2. Wash your hands.

continues on next page

3. Remove the mask from its container. (Note: If gowning procedures are necessary, put the mask on before putting on gown.)
4. Unfold the mask. Do not touch the part of the mask that will cover the face. Hold the mask by the strings only.
5. Place the mask over the nose and mouth. Using a shoelace bow, tie the top strings over the ears, then tie the lower strings.
6. Avoid any unnecessary handling of the mask.

Removing the Mask

1. Wash hands.
2. Untie the lower strings of the mask first. Hold the strings of the mask only.
3. Untie the top strings of the mask. Remove the mask from the face. Handle strings only.
4. Discard the mask into the designated waste receptacle inside the room.
5. Wash hands.

Personal Protective Equipment – Using Gloves

Level I

Purpose

To guide the use of gloves.

Objectives

1. To prevent the spread of infection;
2. To protect wounds from contamination;
3. To protect hands from potentially infectious material; and
4. To prevent exposure to the HIV (AIDS) and hepatitis B (HBV) viruses from blood or body fluids.

Equipment and Supplies

Gloves.

Miscellaneous

1. When gloves are indicated, use disposable single-use gloves.
2. Discard used gloves into the waste receptacle inside the examination or treatment room.
3. Use sterile gloves for invasive procedures to prevent contamination of the patient, and to decrease the risk of infection when changing dressings.
4. Use non-sterile gloves primarily to prevent the contamination of the employee's hands when providing treatment or services to the patient and when cleaning contaminated surfaces.
5. Wash hands after removing gloves. (Note: Gloves do not replace handwashing.)
6. Remove gloves before removing the mask and gown and discard them into the designated waste receptacle inside the room.

When to Use Gloves

1. When touching excretions, secretions, blood, body fluids, mucous membranes or non-intact skin;
2. When the employee's hands have any cuts, scrapes, wounds, chapped skin, dermatitis, etc.;
3. When cleaning up spills or splashes of blood or body fluids;
4. When cleaning potentially contaminated items; and
5. Whenever in doubt.

Procedure Guidelines

Putting on Sterile Gloves

1. Wash hands.
2. Obtain gloves. (Note: If gowning procedures are used, put gloves on after putting on the gown so that the cuff of the gloves can be pulled over the sleeve of the gown.)
3. Open the package. Do not touch the gloves.
4. With one hand, grasp a glove by the inside of the cuff. Insert the opposite hand into the glove. Leave the cuff turned down.

continues on next page

5. Pick up the remaining glove with gloved hand. Insert ungloved hand into the second glove.
6. Pull up cuffs of the glove.

Removing Gloves

1. Using one hand, pull the cuff down over the opposite hand turning the glove inside out.
2. Discard the glove into the designated waste receptacle inside the room.
3. With the ungloved hand, pull the cuff down over the opposite hand, turning the glove inside out.
4. Discard the glove into the designated waste receptacle inside the room.
5. Discard the glove package into a waste receptacle inside the room.
6. Wash hands.

Personal Protective Equipment – Using Gowns

Level I

Purpose

To guide the use of gowns.

Objectives

1. To prevent the spread of infections;
2. To prevent soiling of clothing with infectious material;
3. To prevent splashing or spilling blood or body fluids onto clothing or exposed skin; and
4. To prevent exposure to the HIV (AIDS) and hepatitis B (HBV) viruses from blood or body fluids.

Equipment and Supplies

1. Disposable gowns; or
2. Clean and laundered gowns when disposable gowns are not used.

Miscellaneous

1. Use gowns only once and then discard into an appropriate receptacle inside the exam or treatment room.
2. Clean reusable or disposable gowns may be worn in most circumstances.
3. Use gowns only when indicated or as instructed.
4. Follow established handwashing procedures.
5. Reusable gowns shall be laundered after each use in accordance with established laundry procedures.
6. When use of a gown is indicated, all personnel must put on the gown before treating or touching the resident.
7. Gowns shall be large enough to cover all of the wearer's clothing, and they must be tightly cuffed at the sleeves.
8. After completing the treatment or procedure, gowns must be discarded in the appropriate container located in the room.
9. If blood or another potentially infectious material penetrates a garment(s) (e.g., gown, apron, lab coat, etc.), the garment(s) must be removed immediately or as soon as possible.
10. Soiled gowns must not be worn in break rooms, lobbies, or into any area in which contamination of equipment is likely to occur.

Procedure Guidelines

Putting on the Gown

1. Obtain the gown (disposable or reusable).
2. If long sleeves are being worn, roll the sleeves above the elbows.
3. Wash hands.
4. Unfold the gown so that the opening is at the back.
5. Put your arms into the sleeves of the gown.
6. Fit the gown at the neck.
7. Secure at the neck (tie or Velcro).

continues on next page

8. Overlap the gown at the back. Be sure clothing is completely covered.
9. Secure at the waste (tie or Velcro).

Removing the Gown

1. Untie/unfasten the back of the gown.
2. Remove gloves and discard them into a waste receptacle in the room.
3. Untie/unfasten the neck band. While still holding the neck strings, pull the gown off the shoulders.
4. Remove the gown by rolling it away from the body. Handle the inside of the gown only.
5. Fold the outside (contaminated portion) of gown inward, and roll the gown into a bundle.
6. If the gown is disposable, discard it into the waste receptacle inside the room. If the gown is reusable (washable), discard it into the soiled laundry container inside the room.
7. Wash hands.
8. If a mask was used during the procedure(s) or service, remove it at this time and discard it into the waste receptacle inside the room.
9. Wash hands.

Personal Protective Equipment – Using Protective Eyewear Level I

Purpose

To guide the use of protective eyewear.

Objectives

1. To protect employees from splashes, spattering, spraying, or droplets of blood, body fluids, or other potentially infectious materials.
2. To protect the employees' eyes, nose, and mouth from potentially infectious materials.
3. To prevent occupational exposure to bloodborne pathogens such as the HIV and hepatitis B viruses.

Equipment and Supplies

1. Protective eyewear (disposable or reusable);
2. Goggles (disposable or reusable);
3. Face shield (disposable or reusable); and
4. Masks (disposable or reusable).

Miscellaneous

1. Masks and eye protection devices, such as goggles or glasses with solid side shields or chin-length face shields, shall be worn together whenever splashes, spray, spatter, or droplets of blood or other potentially infectious materials may be generated and eye, nose, or mouth contamination can be expected.
2. Personal eyeglasses should not be considered as adequate protective eyewear.
3. Protective eyewear must have adequate side and top coverage and must fit the employee properly.
4. Hands should be washed after removal of protective eyewear.

Procedure Guidelines

1. Put on eyewear, goggles, mask or face shield per manufacturer's instructions.
2. Adjust the eyewear to fit properly.
3. Dispose of, or clean, eyewear as applicable.
4. Dispose of masks in a designated container.
5. Wash hands after removing the mask and eyewear.

Catheter Stabilization Devices

Policy Statement

Catheter stabilization shall be used to preserve the integrity and position of the infusion catheter.

Policy Interpretation and Implementation

1. Catheter stabilization devices may be used to prevent migration of the catheter, which prevents dislocation and loss of access.
2. Stabilization methods will not interfere with assessment of insertion site or vascular circulation.
3. The following devices may be used to stabilize catheters:
 - a. Manufacturer-designed devices such as STATLOCK®¹ (Venetec International);
 - b. Sterile tape; or
 - c. Surgical strips.
4. Sutures are not a preferred method because they increase the risk of infection.
5. Change catheter stabilization device per protocol or manufacturer's instruction. Most devices are changed every week with dressing change.

Use of Arm Boards in Infusion Therapy

Policy Statement

Arm boards used for any purpose other than for catheter stabilization are considered restraints and are not permitted.

Policy Interpretation and Implementation

1. In general, areas of flexion should be avoided as insertion sites.
2. The use of an arm board can be used to facilitate infusion delivery when the catheter must be placed in or adjacent to an area of flexion.
3. An arm board that is used for the purpose of catheter stabilization at an area of flexion is not considered a restraint.
4. An arm board should be applied in a manner that will not obstruct the ongoing evaluation of the insertion site.
5. When arm board is in place, there must be established intervals for removal. This is to assess circulatory status, range of motion, insertion site, and skin condition.
6. The reason for the use of the arm board must be documented in the medical record. The only acceptable reason for the use of an arm board is for stabilization of the insertion site, which prevents catheter dislodgement.
7. Assessments and removal of arm board schedule are to be documented in resident's permanent medical record.
8. Report that is given to oncoming shift should include the use of arm board and location.

Administration Set/Tubing Changes

Level III

Purpose

The purpose of this procedure is to provide guidelines for aseptic administration set changes in order to prevent infections associated with contaminated IV therapy equipment.

Preparation

1. Label new tubing with date, time, and initials. If facility requires, label may include the date and time that tubing was initiated and when tubing should be discontinued.
2. Assess if filter is to be used for medication, and attach to tubing with each new dose of medication.
3. Assemble equipment and supplies as needed. Assess equipment for sterile condition. Do not use if not sterile.

General Guidelines

1. All IV equipment, including administration sets, shall be managed using aseptic technique and observing standard precautions.
2. Handwashing and non-sterile gloves are always to be used while working with IV equipment.
3. The schedule for changing the administration set is determined by the type of infusion that is being administered (see below).
4. Assess all equipment for sterility and product integrity when opening packaging.
5. Devices that are added to tubing such as extension sets, filters, stopcocks, end caps, or any other devices, should be changed when tubing is changed. All equipment should be of needleless design.
6. All tubing is labeled with start and change date and time. Any tubing that is observed not to have a label must be changed and then labeled accordingly.
7. Primary tubing should have a sterile end cap applied to end of tubing when it is disconnected from the catheter. The sterile end cap is discarded when tubing is to be reconnected to catheter.
8. Use the following guidelines for administration set changes.
9. Primary and secondary continuous infusion administration sets:
 - a. Change no more than every 96 hours, unless suspected contamination has occurred.
 - b. Change primary set if a new catheter is placed.
 - c. Once a secondary set is detached from the primary administration set, the secondary set is considered to be a primary intermittent administration set (changed every 24 hours).
10. Primary or secondary intermittent infusions administration sets:
 - a. Change every 24 hours, or if suspected contamination of tubing or catheter has occurred.
 - b. Blunt cannulas that are used to access needleless devices should be removed immediately after each use, and a new blunt cannula should be aseptically attached.
 - c. Sterile end caps are to be placed on the end of the intermittent tubing in between uses of the tubing. The sterile end cap is to be discarded when tubing is reattached to catheter.
11. Parenteral nutrition administration sets:
 - a. Parenteral nutrition (PN) containing amino acids/dextrose formulations – change tubing and 1.2 micron filter every 24 hours.
 - b. Lipids which contain intravenous fat emulsion – change tubing every 12 hours or with each new container.

continues on next page

- c. Any tubing that is suspected to have been contaminated or compromised should be changed immediately.
12. Blood and blood components administration sets and add-on filters that are used for blood and blood components:
 - a. Administration sets used for blood and blood components should be dedicated to blood transfusion only, and changed every 4 hours.
 - b. If more than one unit can be infused in 4 hours, the transfusion set can be used for up to 4 hours.
 - c. Change tubing at any time if there is suspected contamination or product integrity is suspected.

Equipment and Supplies

1. Non-sterile gloves;
2. Infusion administration sets (tubing and add-on devices);
3. Add-on devices:
 - a. catheter end cap, injection port;
 - b. filters (if necessary);
 - c. stopcock; and
 - d. extension tubing.
4. Infusate solution; and
5. Alcohol pads.

Assessment

Inspect intravenous catheter for any signs/symptoms of IV related complications at scheduled intervals. Observe equipment for sterility or problems.

Steps in the Procedure

1. Perform hand antisepsis.
2. Inspect new equipment (infusate, add-on devices and administration set).
3. Prepare equipment:
 - a. Attach add-on devices to administration set;
 - b. Clamp new administration tubing;
 - c. Spike access site of infusate container with new administration set; and
 - d. Hang infusate from IV pole.
4. Prime new administration set, including add-on devices and tubing:
 - a. Squeeze drip chamber to fill according to manufacturer's instructions ($\frac{1}{3}$ to $\frac{1}{2}$ full);
 - b. Remove cap from tubing, open roller clamp to prime tubing, then hold distal end of tubing over sink or trash can (keep tip sterile) and allow all of the air bubbles to leave tubing;
 - c. Ensure that no air bubbles remain in tubing; and
 - d. When primed, clamp tubing and replace cap.
5. Temporarily stop infusion and disconnect old administration set:
 - a. If continuous fluids are running, stop infusion, clamp tubing, and disconnect old set from catheter;
 - b. Clamp catheter; and
 - c. Dispose of old tubing in trash receptacle, along with infusate bag.
6. Don clean non-sterile gloves.

continues on next page

7. Connecting new tubing:
 - a. Disinfect catheter hub with antiseptic solution (usually alcohol);
 - b. Remove cap from distal end of new tubing;
 - c. Attach primed tubing to catheter access cap; and
 - d. Secure connection by screwing tubing into catheter access cap. Tape connections if needed for extra security.
8. Resume infusion:
 - a. Unclamp catheter;
 - b. Open roller clamp;
 - c. Check pump program or flow regulator device for proper rate/volume; and
 - d. Observe flow rate for 1-2 minutes to ensure accuracy.
9. Discard used supplies.
10. Remove gloves and perform hand antisepsis.
11. Label administration set and tubing with date, time and initials.
12. Document procedure in resident's medical record.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time of the administration set change.
2. The type of flow-control device.
3. The type of solution or medication infusing.
4. The amount of solution or medication to be infused.
5. The rate of infusion.
6. The condition of the IV site.
7. Notification of the physician of any intravenous complications.
8. Resident's response to treatment.
9. The signature and title of the person recording the data.

Reporting

1. Notify physician, supervisor and oncoming shift of resident refusal of procedure or any complications.
2. Report other information in accordance with facility policy and professional standards of practice.

Central Venous and Midline Catheter Flushing

Level III

Purpose

The purposes of this procedure are to maintain patency of midline and central venous catheters (CVADS); to prevent mixing of incompatible medications and solutions; and to ensure entire dose of solution or medication is administered into the venous system.

General Guidelines

1. No physician order is needed for this procedure.
2. The preferred choice for flushing and locking is single-use systems, such as single-dose vials and prefilled syringes.
3. Consult state Nurse Practice Act for RN/LPN scope of practice and functions.

Flushing Protocol

1. Flush catheters at regular intervals to maintain patency AND before and after the following:
 - a. administration of intermittent solutions;
 - b. administration of medication;
 - c. administration of blood or blood products;
 - d. obtaining blood samples; and/or
 - e. converting from continuous to intermittent therapies.
2. For multi-lumen access devices, each lumen is considered a separate catheter and must be flushed according to established catheter protocols to prevent occlusion. Some catheters (per manufacturer guidelines or organization policy) may need to be flushed more often.
3. The minimum volume of flush solution should be equal to at least twice the volume capacity of the catheter and add on devices.
4. Use only preservative-free 0.9% sodium chloride for saline flushes.

Flushing Technique

1. Use a syringe barrel size of 10 mL or greater when flushing an infusion catheter to avoid excessive pressure inside the catheter, to prevent potential rupture of the catheter, and to prevent dislodgement of clots.
2. Use a push-pause or pulsing motion for flushing technique.
3. Aspirate the CVAD catheter for blood return to confirm patency prior to administration of medications and solutions.

Locking

1. Follow manufacturer instructions regarding the recommended solution (heparin vs. saline) for locking a midline or CVAD.
2. If heparin is recommended, obtain an order for the appropriate dilution and amount

Complications

1. If resistance or lack of blood return arises at any time during flushing, STOP the flush and consult IV nurse specialist or physician.
2. Insertion site assessment should be done as part of flushing process to monitor for complications.

continues on next page

3. If this procedure is not compatible with manufacturer guidelines for flushing individual catheters, refer to the manufacturer's instructions.

Equipment and Supplies

1. Preservative-free 0.9% sodium chloride syringes (prefilled);
2. Heparin, as ordered;
3. Non-sterile gloves; and
4. Alcohol wipes.

Steps in the Procedure

1. Perform hand antisepsis. Don non-sterile gloves.
2. Disinfect catheter device with antiseptic solution (usually alcohol).

Flushing to maintain patency of catheter:

1. Disinfect needleless access device with alcohol wipe.
2. Remove air bubbles from syringe.
3. Connect 10 mL barrel size syringe containing saline (amount as ordered or per facility protocol) to catheter via needleless connection device.
4. Aspirate slowly for blood return to ensure patency of catheter. Blood return may be difficult to obtain on small gauge catheters.
5. Slowly administer appropriate amount of saline flush (per pharmacy or facility protocol) using the push-pause technique. Leave 0.5 mL of flush in syringe to avoid pushing air into catheter.
6. Disconnect syringe from needleless access device.
7. LOCK with heparin, if ordered.
8. Disinfect needleless connection device with alcohol wipe.
9. Repeat process on each lumen of multi-lumen catheter.

Flushing when giving medications SAS method (saline, administer, saline):

1. Disinfect access device with alcohol wipe.
2. Remove air bubbles from syringe.
3. Connect 10 mL syringe containing saline (amount as ordered or per facility protocol) to catheter via injection or access device.
4. Unclamp catheter or lumen.
5. Aspirate slowly for blood return to ensure patency of catheter.
6. Flush with saline (amount established by pharmacy or facility protocol) using push-pause method.
7. Disinfect needleless connection device with alcohol wipe.
8. Connect primed medication tubing to injection/access device.
9. Administer medication.
10. Disconnect medication from access device.
11. Disinfect needleless connection device with alcohol wipe.
12. Connect another 10 mL syringe containing saline (amount and/or concentration as ordered or per facility protocol) to catheter via injection or access device.
13. Flush with saline (amount established by pharmacy or facility protocol). Flush at the same rate of injection as the medication.
14. Disconnect syringe.

continues on next page

15. LOCK with heparin, if ordered.
16. Clamp catheter or lumen.
17. Monitor resident's response.
18. Monitor resident for any signs and symptoms of IV complications.
19. Discard used supplies in appropriate waste container.
20. Remove gloves.
21. Wash hands.
22. Document procedure in resident's medical record.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the medication was administered.
2. Total amount of flush administered.
3. The route and rate of medication administration.
4. The condition of the IV site before and after administration.
5. Notification of physician, if there are any complications.
6. Resident's response.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor, physician, and oncoming shift of any complications.
2. Report other information in accordance with facility policy and professional standards of practice.

Central Venous Catheter Dressing Changes

Level III

Purpose

The purpose of this procedure is to prevent catheter-related infections that are associated with contaminated, loosened, soiled, or wet dressings.

Preparation

1. Check the State's Nurse Practice Act for LPNs regarding scope of practice for changing a central venous catheter dressing.
2. A physician's order is not needed for this procedure.

General Guidelines

1. Apply and maintain sterile dressing on intravenous access devices. Dressings must stay clean, dry, and intact. Explain to the resident that the dressing should not get wet.
2. Change dressings if any suspicion of contamination is suspected.
3. Catheter site care shall allow for the observation and evaluation of the catheter-skin junction and surrounding tissue.
4. After original insertion of CVAD, the dressing will consist of gauze and TSM. This must be changed within 24 hours.
 - a. Replace with sterile transparent dressing.
 - b. Use gauze under the TSM if there is drainage from the catheter insertion site.
5. Change transparent semi-permeable membrane (TSM) dressings at least every 5-7 days and PRN (when wet, soiled, or not intact).
6. If gauze is used, it must be changed every 2 days.
7. Approved antiseptic solutions for cleaning insertion site area include alcohol, povidone-iodine, chlorhexidine gluconate, and tincture of iodine as single agents or in combination. A formula containing alcohol and >0.5% chlorhexidine gluconate is preferred.
8. Allow the insertion site to air dry before placing dressing. Do not blow or wave over the site.
9. Removal of old dressing is an aseptic, non-sterile procedure.
10. With a well-healed tunneled central venous access device, consideration may be given to no dressing.

Equipment and Supplies

To remove dressing

1. Non-sterile gloves; and
2. Alcohol wipes.

To replace sterile dressing

1. Sterile central venous catheter dressing change kit; and
2. Plastic Chux™ or clean towel.

Assessment

Observe insertion site and surrounding area for complications.

continues on next page

Steps in the Procedure

Procedure to remove old dressing:

1. Clean the over the bed table with soap and water, or alcohol.
2. Place equipment on table.
3. Perform hand antisepsis. Wear non-sterile gloves.
4. Resident should be lying on bed, with head facing opposite direction from dressing site. If resident is coughing or has a tracheostomy, apply mask to resident if he or she can tolerate it.
5. Ask resident to keep arms at side of body or have someone help him or her to do this.
6. The dressing can be rubbed with alcohol wipes to help dissolve the adhesive and loosen the dressing. *Never use scissors near the catheter.*
7. Remove any tape on the dressing.
8. While stabilizing the catheter, remove the dressing in the direction of the catheter insertion (from the hub of the catheter toward the head) to avoid dislodging the catheter. This is especially important with Midlines and PICC lines.

Procedure to apply sterile dressing:

1. Open sterile dressing kit.
2. Apply mask.
3. Apply sterile gloves. Once the gloves are on, only the contents of the kit can be touched. *Do not pick up the catheter with the sterile gloves. The outside of the catheter is not sterile.* Use sterile gauze to pick up catheter when cleaning underneath the catheter to preserve the sterile gloves.
4. Clean catheter insertion site with approved antiseptic solution.
5. Allow antiseptic solution to air dry on skin. Do not blow or wave over site.
6. Apply sterile transparent dressing (with or without gauze) to area, making sure to center the dressing over the insertion site. Starting at the catheter, smooth dressing outward toward the edges to remove air. While removing the paper around edges of dressing, press down on the edges of the dressing. Label with initials, date and time.
7. The sterile tape from the kit may be used to secure edges if needed. Placing a piece of tape across the bottom of the dressing can help secure the catheter in place and keep the catheter from pulling on the dressing. The tape should not cover the insertion site.
8. If the resident has hair on the dressing site:
 - a. Shaving with a razor or cutting the hair with scissors is not permitted, as this may cut the skin and/or damage the catheter.
 - b. Instead, apply a skin protecting agent such as Skin Prep™ after the area has been cleaned with antimicrobial agents.
 - c. Apply only around the perimeter of the insertion site where the dressing will be placed. Do not apply directly to the insertion site.
 - d. Allow Skin Prep™ to dry completely before applying transparent dressing.
9. If catheter is inserted in neck or other area of flexion, place the dressing over the insertion site. Then, cut another dressing in two pieces and reinforce the edges of the original dressing with cut pieces of the second dressing.
10. Dispose of gloves, equipment and old dressing in appropriate containers.
11. Reposition resident for comfort.

continues on next page

Documentation

1. The following information should be recorded in the resident's medical record:
 - a. Date and time dressing was changed.
 - b. Location and objective description of insertion site.
 - c. Any complications, interventions that were done.
 - d. Condition of sutures (if present).
 - e. Any questions, education given to resident, resident's statement regarding IV therapy and response to procedure.
 - f. Signature and title of the person recording the data

Reporting

1. Report any signs and symptoms of complications to physician, supervisor and oncoming shift.
2. Intervene as necessary.

Changing the Needleless Connection Device and Extension Tubing

Level III

Purpose

The purpose of this procedure is to provide guidelines to change needleless connection devices or extension tubing to prevent catheter related infections.

General Guidelines

1. Needleless connection devices may also be referred to as end caps, pressure valves (positive, negative or neutral), or by brand names (e.g., Ultrasite Valve[®]).
2. All lumens of the catheter will have a needleless connection device on the hub to prevent intake of air embolus and/or prevention of outward blood flow.
3. All needleless connectors will have a Luer-lok[®] design to ensure a secure connection.
4. Change needleless connection device and extension tubing with administration set change, every 24 hours when TPN/PPN infusing (with new bag change) before obtaining blood for culture, and after blood draws.
5. For multi-lumen catheters, change needleless connection device every _____ hours for lumens not in use.
6. Change needleless connection devices using aseptic technique.
7. Clean the needleless connection device with an antiseptic solution prior to use. The antiseptic solution should be a single use package. Alcohol is the most commonly used solution.
8. Anytime that a needleless connection device is removed, discard and replace with a new sterile device.
9. The extension tubing should always have a needleless connection device on the end of the tubing.
10. Use extension tubing on peripheral catheters (saline locks) to avoid too much pressure on the vein during flushing. Change extension tubing with peripheral catheter site change.
11. Flush needleless connection device/extension tubing with preservative-free 0.9% normal saline before attaching to catheter.
12. Only use smooth clamps on catheters. Never use clamps with “teeth” to avoid tearing catheter.

Equipment and Supplies

1. Non-sterile gloves;
2. Needleless connection device or extension tubing;
3. Alcohol wipes;
4. Preservative-free 0.9% normal saline flush to flush needleless connection device or extension tubing; and
5. Smooth clamps.

continues on next page

Steps in the Procedure

1. Stop any fluids that are infusing and disconnect IV tubing. The IV tubing should be replaced when new needleless connection device/extension tubing is placed.
2. Perform hand antisepsis. Wear non-sterile gloves.
3. Attach normal saline flush syringe to new needleless connection device/extension tubing. Prime with small amount of preservative-free 0.9% normal saline.
4. Clamp with smooth clamp or kink catheter and have resident hold his/her breath while removing and replacing old needleless connection device/extension tubing. Allow resident to breath after replacement.
5. Place new needleless connection device/extension tubing onto catheter. Unclamp/ unkink catheter.
6. Finish flushing catheter with preservative-free 0.9% normal saline (and heparin if required).
7. Remove syringe and clamp catheter (open-ended catheter).
8. Extension tubing may need to be coiled on side of catheter and taped in place.
9. Dispose of old equipment properly.
10. Remove gloves and perform hand antisepsis.
11. Don non-sterile gloves to reattach tubing if fluids were running previously.

Documentation

1. Document on treatment kardex when procedure was done.
2. Document in resident's medical record if any complications of IV catheter were present and interventions necessary.
3. Document if physician was made aware of complications.

Reporting

1. Report to physician, supervisor, and oncoming shift of any complications with catheter.

Disinfection of Catheter Insertion Site

Level III

Purpose

The purpose of this procedure is to prevent bacteria from being introduced into the skin and vascular system.

General Guidelines

1. Antiseptic solutions should be in a single-unit package.
2. If the intended insertion site is visibly soiled, the site should be cleaned with soap and water prior to the application of antiseptic solution.
3. Clipping of hair in insertion area should be done with sterile scissors or disposable head surgical clippers before cleaning the site.
4. Chlorhexidine solution (>5% chlorhexidine in alcohol) is preferred for skin cleaning.
5. If there is a contraindication to chlorhexidine solution, the following antiseptic agents are acceptable:
 - a. Iodine tincture;
 - b. Povidone iodine; and
 - c. 70% alcohol.
6. Chloraprep[®] is the trade name for 2% chlorhexidine gluconate (CHG)/70% isopropyl alcohol combination antiseptic.
7. Chloraprep[®] or other antiseptic solution is used for skin preparation pre-procedure or during dressing changes.
8. Advantages/features of Chloraprep[®] include the following:
 - a. A strong ability to bind to the skin and a high level of antibacterial activity.
 - b. Prolonged residual effects - prevents re-growth of microorganisms on the skin for at least 48 hours.
 - c. Broad spectrum - effective against gram positive and negative bacteria.
 - d. Remains active in the presence of blood, serum, and other protein rich biomaterials.
 - e. Can be used for residents with iodine allergy.
 - f. Available in many applicator sizes.
9. The cleaning process with Chloraprep[®] involves a back and forth scrubbing motion.
 - a. On dry sites – scrub back and forth for 30 seconds.
 - b. On a wet area – scrub for 2 minutes.
 - c. For IV dressing changes:
 - (1) pick up the catheter with sterile gauze; and
 - (2) scrub with Chloraprep[®] for 30 seconds on all four sides around the catheter.
 - d. Allow Chloraprep[®] to AIR DRY before placing any dressings on skin or doing a procedure.
10. When using other antiseptic solutions other than Chloraprep[®], the technique of cleaning is circular motion starting at the intended insertion site and moving outward.

Equipment and Supplies

1. Chloraprep[®] swab or sponge, or other antiseptic solution.
2. Sterile/non-sterile gloves, as indicated.
3. Sterile dressing change kit for CVAD (if needed), or alcohol pads for peripheral catheter.

continues on next page

2. Chloraprep is a registered trademark of Enturia/Cardinal Health. www.enturia.com/products/chloraprep.

Steps in the Procedure

1. Wash hands, wear non-sterile or sterile gloves, as indicated.
2. If areas are visibly soiled or contaminated, wash with soap/water or alcohol first to remove dirt. Allow to air dry then clean with Chloraprep[®] or other antiseptic solution.
 - a. Remove Chloraprep[®] equipment from package, break medicine ampule that is inside by pushing on the wings or body part of equipment. There will be a “pop” sound.
 - b. Turn the Chloraprep[®] equipment upside down and allow fluid to go into sponge.
 - c. Do not touch the sponge.
 - d. Use a back and forth mild scrubbing action to clean skin.
3. Any type of antiseptic cleansing device is for single use only. After use, dispose of in trash container.

Documentation

Document time and date of skin cleaning, stating what type of antiseptic was used on the skin, and type of catheter inserted.

Reporting

Report to Physician (if needed) or oncoming shift regarding the condition of the skin and/or catheter site.

Disinfection of Durable Medical Equipment for Intravenous Therapy

Level II

Purpose

Durable medical equipment (DME) shall be cleaned and disinfected routinely and following resident use.

General Guidelines

1. Clean and disinfect infusion-related DME when visibly soiled.
2. Clean and disinfect infusion-related DME that is in use for a single resident at least weekly.
3. Clean and disinfect infusion-related DME that is not in use at established intervals.
4. Examples of infusion-related DME include:
 - a. IV poles;
 - b. Electronic and mechanical infusion devices; and
 - c. Non-disposable infusion-related equipment.
5. Dedicate infusion-related DME for *single resident use* when resident is on contact precautions, and clean/disinfect before use on another resident.
6. Use high level germicides that are Environmental Protection Agency (EPA) registered, and use in accordance with manufacturers' labeled use and directions.
7. Do not use disinfection solutions that could alter the integrity or performance of the equipment. Avoid the sensor areas on electronic pumps.
8. Use standard precautions when handling DME. Place DME in a plastic bag or decontaminate before transporting to another location for cleaning and disinfection.

Implanted Venous Port – Accessing

Level III

Policy

The medical personnel who access or de-access an implanted venous port must have additional training and proven clinical competency before performing this procedure.

Definition

1. An implanted venous port is a surgically placed and surgically removed catheter that is placed in the subcutaneous layer of the skin in the mid chest area or upper arm. The catheter tubing ends in the vena cava. It generally is not sutured in place to avoid collection of bacteria at suture site.
2. The catheter consists of three parts – the septum, reservoir, and tubing. The self sealing septum is usually made of silicone.

General Guidelines

1. Verify with state Nurse Practice Act the scope of practice for RNs and LPNs regarding this procedure.
2. Use only a non-coring needle to access the port. The needle can be different gauges and lengths according to the amount of subcutaneous tissue over port. The wings of the needle, when inserted, should be even (flush) with the septum of the port.
3. Ports may be single or double lumen. Each port is a separate catheter that must be flushed daily when accessed but not infusing.
4. Other types of ports may be placed (subdural, arterial, epidural, peritoneal) and are used per manufacturer instructions.
5. Topical anesthetic may be applied to skin access site per order to numb area before needle insertion.
6. Power injection capability should be verified before using the port for CT injection dye. CT injection dye requires a power port.
7. There must be **positive blood return** with aspiration before port can be used for infusion.
8. Preparing the insertion site and placing the non-coring needle is an aseptic procedure.

Equipment and Supplies

1. Central line dressing change kit or the following:
 - a. Sterile gloves;
 - b. Mask;
 - c. Cleaning solution (chlorhexidine/alcohol or alcohol wipes); and
 - d. Transparent sterile dressing.
2. Port-a-Cath kit or the following:
 - a. Non-coring needle with attached extension set with clamp;
 - b. Needleless access device;
 - c. Two normal saline (preservative-free 0.9% sodium chloride) flushes; and
 - d. Topical anesthesia if ordered.

continues on next page

Steps in the Procedure

1. Explain procedure to resident or legal representative.
2. Position resident for comfort and expose port site. (Note: Most ports are accessed easier by placing the resident in a semi-fowler's or supine position.)
3. Apply topical anesthesia if prescribed. Wait about 15 to 20 minutes for the anesthetic to take effect. Remove residual with saline before cleaning.
4. Wash hands and assemble equipment on clean surface near resident.
5. Place a mask on yourself and on the resident.
6. Apply non-sterile gloves.
7. Palpate port under skin by locating between thumb, index and middle fingers of dominant hand.
8. Remove gloves.
9. Wash hands.
10. Open central line dressing kit or Port-a-Cath kit and prepare a sterile field.
11. Apply sterile gloves.
12. Flush air out of non-coring needle.
13. Hold saline syringe with sterile gauze (to preserve sterile gloves), attach syringe to needleless connection device and prime tubing and non-coring needle with saline.
14. Clean port area with antiseptic cleaning solution. Allow to air dry.
15. With non-dominant hand, palpate port. Hold port steady in place. Insert non-coring needle perpendicular (straight, not at an angle) into the center of the septum until it goes no further. You will feel slight resistance and "drag" until needle hits the bottom of the reservoir.
16. While holding needle steady, check for blood return by pulling back on the syringe plunger. If no blood return, attempt the following:
 - a. Pull needle up just slightly (needle may be "jammed" into the reservoir floor) and attempt aspiration again.
 - b. If there is still no blood return and you have ensured the needle is in the center of the port, have the resident perform a valsalva maneuver, lift arms above head, cough, or reposition.
 - c. If there is still no blood return, attempt access again using a new needle. Maintain aseptic procedure.
17. After blood return is established, flush with normal saline. Always leave the last 0.5 mL of saline in syringe to avoid pushing air into catheter.
18. Clamp the tubing, remove saline syringe and connect the needless connector.
19. Cover needle with transparent sterile dressing, making sure that edges of the dressing are firm against the skin. Use Skin Prep™ on skin first, if necessary, and let dry before placing dressing on skin.
 - a. A folded 2 x 2 sterile gauze may be placed under the wings of the non-coring needle if it does not obscure the insertion site. This would be done if needle is not at same level as port to stabilize it, or for protection of the skin. This is not considered to be a gauze dressing and can stay in place for up to 7 days.
20. Label dressing with date, time, and initials of person who is performing procedure.
21. Secure extension set to skin with sterile tape from dressing kit.
22. Connect the IV medication/solution to the needless connector and infuse as ordered.
23. When infusion is finished, flush according to protocol.

continues on next page

Documentation

1. Document the following in the resident's medical record:
 - a. Date and time of procedure.
 - b. Resident education.
 - c. Needle size (length and gauge).
 - d. Blood return.
 - e. Whether implanted venous access port flushed with ease.
 - f. Resident response to procedure.
2. Document the flushing agent(s) and amount(s), medication or solution infused, and any topical anesthetic in the Medication Administration Record.
3. If this is an access for flush only, mark on Treatment Administration Record and indicate next date procedure is to be done.

Version	1.2 (H5MAPR0320)

Implanted Venous Port – De-Accessing

Level III

Policy

The medical personnel who access or de-access an implanted venous port must have additional training and proven clinical competency before performing this procedure.

General Guidelines

1. Verify with state Nurse Practice Act the scope of practice for RNs and LPNs regarding this procedure.
2. De-accessing (taking the needle out of the port) is an aseptic procedure. Accessing the port is a sterile procedure.
3. Replace the non-coring needle every 5-7 days if port is being used for infusion therapy.
4. Replace the non-coring needle immediately if considered to be compromised.
5. Flush the port before the needle is removed.
6. The septum in the port is self-sealing. Resistance upon removal is normal.

Equipment and Supplies

1. Non-sterile gloves;
2. One 10 mL syringe with normal saline (preservative-free 0.9% sodium chloride);
3. Chlorhexidine/alcohol or alcohol wipes; and
4. Sterile 2 x 2 gauze and tape, or adhesive bandage.

Steps in the Procedure

1. Explain the procedure to the resident or legal representative.
2. Position resident as flat as tolerated. Expose port.
3. Perform hand antisepsis. Place equipment on clean surface near resident.
4. Don non-sterile gloves.
5. Discontinue any running IV fluids.
6. Clamp extension tubing on non-coring needle.
7. Clean end of needleless access device with chlorhexidine/alcohol or alcohol wipe.
8. Flush as ordered.
9. Remove syringe and clamp tubing.
10. Remove old dressing from distal to proximal (toward the head) being careful not to pull on non-coring needle. If the dressing cannot be removed completely without pulling on the needle, then gather the remainder on the top of the non-coring needle. The port should be free of any adhesive dressing.
11. Discard stabilizing gauze or bio-patch and gloves.
12. Stabilize port with thumb and index finger on sides of port.
13. With other hand, pull the non-coring needle straight upward out of port using a steady upward motion.
14. Slide safety device over non-coring needle. Discard with needle and dressing in sharps container.
15. Clean insertion site with chlorhexidine/alcohol or alcohol wipe.
16. Cover with sterile 2 x 2 gauze transparent dressing or adhesive bandage per protocol. Leave dressing in place for 24 hours.

continues on next page

Documentation

1. Document the date and time that port was de-accessed in the resident’s medical record.
2. Document the flushing agent, flush amounts; and condition of site on the appropriate nursing document.

Implanted Venous Port – Flushing Protocol

Level III

Purpose

The purposes of this procedure are to ensure that implanted venous ports are flushed to maintain patency; to prevent mixing of incompatible medications and solutions; and to ensure entire dose of solution or medication is administered into the venous system.

General Guidelines

1. Verify with State Nurse Practice Act for RN/LPN scope of practice and function.
2. The implanted venous port is a central line.
3. Use aseptic technique when accessing an implanted port.
4. Use a syringe barrel size of 10 mL or greater when flushing an infusion catheter to avoid excessive pressure inside the catheter, to prevent potential rupture of the catheter, and to prevent dislodgement of clots.
5. When the port is accessed but not infusing, flush once a day with normal saline (preservative-free 0.9% sodium chloride).
6. When the port is used intermittently for medication administration, flush with preservative-free 0.9% sodium chloride before and after medication administration in addition to daily maintenance.
7. If the port is not accessed, refer to manufacturer's instructions for flushing protocol.
8. The volume of normal saline used for flushing should be equal to twice the internal volume of the catheter.³
9. Only specially designed non-coring safety needles are to be used when accessing an implanted port.
 - a. Use the smallest gauge non-coring needle that will accommodate the prescribed therapy.
 - b. A non-coring needle does not need to stay in place if no medications/solutions are being given.
10. When the non-coring needle is to stay in place, a sterile transparent semi-permeable dressing should be used to cover the needle and port area.
11. If contamination of the dressing is suspected, the dressing and needle must be changed.

Equipment and Supplies

1. For daily maintenance:
 - a. One prefilled 10 mL barrel size syringes of preservative-free 0.9% sodium chloride (saline);
 - b. Chlorhexidine/alcohol or alcohol wipes; and
 - c. Gloves.
2. For intermittent medications:
 - a. Two prefilled 10 mL barrel size syringes of preservative-free 0.9% sodium chloride (saline);
 - b. Chlorhexidine/alcohol or alcohol wipes; and
 - c. Gloves.
3. Removal of needle at end of therapy:
 - a. One prefilled 10 mL barrel size syringe with 5 mL preservative-free 0.9% sodium chloride (saline);
 - b. Gloves;

continues on next page

3. Infusion Nurses Society. 2016 Infusion Therapy Standards of Practice, S40(C)(1)

- c. Sharps container; and
- d. Alcohol wipes.

Steps in the Procedure

1. Assemble supplies.
2. Perform hand antisepsis.
3. Explain procedure to resident.
4. Prime syringes.
5. For daily maintenance (accessed but not infusing):
 - a. Unclamp catheter.
 - b. Apply gloves.
 - c. Clean needleless access device with chlorhexidine or alcohol wipe.
 - d. Connect saline-filled syringe.
 - e. Check for catheter patency:
 - (1) Aspirate for blood return.
 - (2) If resistance is felt or there is no blood return, check for closed clamp.
 - f. Flush using push-pause technique. Remove syringe. Dispose of syringe in sharps container.
 - g. Clamp catheter.
6. For intermittent medications (in addition to daily maintenance):
 - a. Unclamp catheter.
 - b. Apply gloves.
 - c. Clean needleless access device with chlorhexidine or alcohol wipe.
 - d. Connect first saline-filled syringe.
 - e. Check for catheter patency:
 - (1) Aspirate for blood return.
 - (2) If resistance is felt or there is no blood return, check for closed clamp.
 - f. Flush with preservative-free 0.9% sodium chloride (saline).
 - g. Administer medication.
 - h. Connect second saline-filled syringe.
 - i. Flush with preservative-free 0.9% sodium chloride (saline).
 - j. Clamp catheter.
 - k. Dispose of syringes in sharps container.
 - l. Remove gloves.
7. Removal of non-coring needle at end of therapy: See *Implanted Venous Port – De-accessing*.

Documentation

1. Document the following in the resident's medical record:
 - a. Location of the catheter, type and amount of flush used.
 - b. Result of blood return, any resistance felt.
 - c. Condition of insertion site and condition of dressing.
 - d. Any complications and interventions necessary.
 - e. Resident tolerance of procedure.
 - f. Any communication with physician, supervisor, or oncoming shift.
 - g. Any change in size of non-coring needle that was used.

continues on next page

Reporting

1. Report any complications/interventions.
2. Report any communication with physician, supervisor, or oncoming shift.

Intravenous Catheter Complications: Occlusion

Level III

Purpose

The purpose of this procedure is to help the registered nurse identify and manage catheter occlusion.

General Guidelines

1. Catheter occlusion management is to be performed by registered nurses who have documented/demonstrated clinical competency in this area.
2. A physician's order is required for this procedure and for the specific fibrinolytic agent.
3. Catheter occlusion presents as a loss of catheter patency. It can range from partial to complete occlusion.
 - a. Partial occlusion is likely if fluids can be infused, but aspiration of blood does not occur.
 - b. Total occlusion is likely if fluids cannot be infused and blood cannot be aspirated.
4. Do not attempt to infuse anything through a central venous catheter that appears to be partially or totally occluded.
5. For multi-lumen central venous catheters it is not acceptable to leave a lumen occluded and untreated just because other lumens are functioning.
6. Types of occlusions:
 - a. Thrombotic (blood clots, fibrin): Fibrin sheath/tail occurs when fibrin adheres to the tip of the catheter. This can allow infusion, but not withdrawal of blood;
 - b. Mechanical (kinks or closed clamps);
 - c. Precipitates (medication); or
 - d. Lipid deposits (parenteral nutrition).
7. Signs of occlusion:
 - a. Inability to flush, infuse fluids, or withdraw blood;
 - b. Sluggish flow or sluggish blood return;
 - c. Frequent occlusion alarms on pumps; or
 - d. Visual clots or precipitates in lumen of catheter.
8. Occlusions can lead to:
 - a. Delayed treatment;
 - b. Increased risk of infection;
 - c. Increased cost of care;
 - d. Increased risk of losing site; and/or
 - e. Increased risk of thrombus related complications.
9. When running multiple medications in sequence or using parenteral nutrition (PN), the catheter should be flushed with normal saline (preservative-free 0.9% sodium chloride) in between medications or when new PN bag is started. This will avoid buildup of precipitates in the lumen.
10. When treating thrombotic occlusions, catheter salvage is preferred over catheter replacement.

continues on next page

Steps in the Procedure

Troubleshooting IV System for Occlusion:

1. Starting at tubing insertion site in fluid chamber of bag, follow tubing down to catheter insertion site checking for kinks and/or closed clamps.
2. Check pump to make sure that tubing is loaded and working properly.
3. When sutures are present, check to see if they are too tight causing pressure on catheter.
4. Check for clogged filter or needleless connector.
5. Check for visible blood in catheter or add-on device.
6. Verify medication compatibility to check for possible interaction precipitates.
7. Obtain chest X-ray for catheter tip position on central venous access catheters (per order).
8. Visually check for clots/precipitates in catheter.

For Thrombotic Occlusion:

1. This treatment is not to be used on peripheral or midline catheters.
2. Take vital signs before and after procedure for baseline in case of any complications during procedure.
3. Explain procedure to the resident.
4. Ask resident to inform staff if any chest pain, shortness of breath, or any unusual symptoms develop. STOP procedure immediately if any of these signs or symptoms occur.
5. Position resident for comfort.
6. Prepare and administer thrombolytic agent according to the manufacturer's instructions and physician/practitioner order.
7. Use at least a 10mL syringe for administration.
8. Notify the physician or practitioner if catheter patency is not restored.

For Medication Precipitate or Lipid Residue:

1. Explain procedure to the resident.
2. Position resident for comfort.
3. Prepare and administer catheter-clearance agent according to the manufacturer's instructions and physician/practitioner order.
4. Use at least a 10mL syringe for administration.
5. Notify the physician or practitioner if catheter patency is not restored.

Documentation

The following information should be recorded in the resident's medical record:

1. Start and stop time of procedure.
2. Pre and post procedure vital signs.
3. Name of medication and volume infused. Instillation of 2nd dose if given.
4. Specific times and results of aspiration attempts (positive or negative blood return).
5. Resident response to procedure and any complications (if occurred).
6. Amounts of flush.
7. Any orders received to remove/replace catheter.

continues on next page

Reporting

1. Report to physician if procedure was not successful for restoration of blood return.
2. Report any new orders that are received to remove/replace catheter.
3. Report results of procedure to oncoming shift/supervisor.

Version	1.2 (H5MAPR0314)

Midline Dressing Changes

Level III

Purpose

The purpose of this procedure is to prevent catheter-related infections associated with contaminated, loosened or soiled catheter-site dressings.

General Guidelines

1. Change midline catheter dressing 24 hours after catheter insertion, every 5-7 days, or if it is wet, dirty, not intact, or compromised in any way.
2. Use sterile technique when changing a midline catheter dressing.
3. Verify with state Nurse Practice Act as to LPN/RN scope of practice for this procedure.
4. Use a sterile, transparent, semipermeable membrane (TSM) or gauze dressing.
5. If gauze dressing is used, cover the gauze with a TSM dressing and change the dressing every 48 hours.

Equipment and Supplies

1. To place new dressing:
 - a. Sterile dressing kit for catheters (sterile gloves, mask, TSM dressing, antiseptic cleaning solution, tape, label, gauze).
2. To remove old dressing:
 - a. Non-sterile gloves; and
 - b. Alcohol wipes.

Steps in the Procedure

Procedure to remove old dressing:

1. Clean the over the bed table with soap and water, or alcohol.
2. Place equipment on table.
3. Perform hand antisepsis. Wear non-sterile gloves.
4. Resident should be positioned with head facing away from dressing site. If resident is coughing or has a tracheostomy, apply mask to resident if he or she can tolerate it.
5. Ask resident to keep arms at side of body or have someone help him or her to do this.
6. The dressing can be rubbed with alcohol wipes to help dissolve the adhesive and loosen the dressing. Never use scissors near the catheter.
7. Remove any tape on the dressing.
8. While stabilizing the catheter, remove the dressing in the direction of the catheter insertion (from the hub of the catheter toward the head) to avoid dislodging the catheter. This is especially important with Midlines and PICC lines.

Procedure to apply sterile dressing:

1. Open sterile dressing kit.
2. Apply mask.

continues on next page

3. Apply sterile gloves. Once the gloves are on, only the contents of the kit can be touched. Do not pick up the catheter with the sterile gloves. The outside of the catheter is not sterile. Use sterile gauze to pick up catheter when cleaning underneath the catheter to preserve the sterile gloves.
 - a. Clean catheter insertion site with approved antiseptic solution.
 - b. Allow to air dry completely before placing dressing (at least 30 seconds for chlorhexidine/alcohol wipe).
4. Apply sterile transparent dressing or gauze with transparent dressing to area, making sure to center the dressing over the insertion site. Starting at the catheter, smooth dressing outward toward the edges to remove air. While removing the paper around edges of dressing, press down on the edges of the dressing. Label with initials, date and time.
5. The sterile tape from the kit may be used to secure edges if needed. Placing a piece of tape across the bottom of the dressing can help secure the catheter in place and keep the catheter from pulling on the dressing. The tape should not cover the insertion site.
6. If the resident has hair on the dressing site:
 - a. Do not shave with a razor or cut the hair with scissors, as this may cut the skin and/or damage the catheter.
 - b. Instead, apply a skin protecting agent (e.g., Skin Prep™) after the area has been cleaned with antimicrobial agents.
 - c. Apply skin protectant only around the perimeter of the insertion site where the dressing will be placed. Do not apply directly to the insertion site.
 - d. Allow skin protecting agent (e.g., Skin Prep™) to dry completely before applying transparent dressing.
7. If catheter is inserted in area of flexion, place the sterile TSM dressing over the insertion site. Then, cut sterile TSM dressing in two pieces and reinforce the edges of the original dressing with cut pieces of the second.
8. Dispose of gloves, equipment and old dressing in appropriate containers.
9. Reposition resident for comfort.

Documentation

1. The following information should be recorded in the resident's medical record:
 - a. Date and time dressing was changed.
 - b. Location and objective description of insertion site.
 - c. Any complications, interventions that were done.
 - d. Condition of sutures (if present).
 - e. Any questions, education given to resident, resident's statement regarding IV therapy and response to procedure.
 - f. Signature and title of the person recording the data.

Reporting

1. Report any signs and symptoms of complications to physician, supervisor and oncoming shift.
2. Intervene as necessary.

Peripheral IV Catheter Flushing

Level III

Purpose

The purpose of this procedure is to ensure that the peripheral IV (over the needle, peripheral short) catheter will be flushed prior to each infusion to assess catheter patency and function, and after each infusion to clear the catheter lumen of medication and to prevent contact between incompatible medications.

General Guidelines

1. Verify with State Nurse Practice Act the scope of practice for RNs and LPNs regarding this procedure.
2. A physician's order is not needed to flush a peripheral short catheter.
3. Use preservative-free 0.9% sodium chloride (normal saline) for flushing a peripheral catheter. If medication is incompatible with normal saline, use 5% dextrose in water and follow with normal saline.
4. Flush and lock the peripheral catheter used for intermittent infusion at least every 12 hours.
5. Do not flush or lock a peripheral catheter with heparin.
6. The volume of preservative-free 0.9% sodium chloride (normal saline) used for catheter flushing should be determined by the size of the catheter and type of infusion.
 - a. It is recommended that the volume of flushing solution be at least twice the volume of the catheter system.
 - b. For a peripheral catheter, 2 to 5 mL of preservative-free 0.9% sodium chloride (normal saline) before and after infusion is generally adequate.
7. Use a syringe barrel size of 10 mL or greater when flushing to avoid excessive pressure inside the catheter, prevent potential rupture of the catheter, and prevent dislodgement of clots.
8. Apply the push-pause technique to flush catheter.
9. Leave 0.5 mL of preservative-free 0.9% sodium chloride (normal saline) in the syringe to avoid pushing air into catheter.
10. If there is resistance or difficulty during flushing procedure, evaluate need for site rotation.
11. Monitor for infiltration of the vein during flushing procedure.
12. Follow manufacturer's instructions for flushing if different from above.

Equipment and Supplies

1. 10 mL barrel syringe with preservative-free 0.9% sodium chloride (saline) (1 or 2);
2. Alcohol wipes; and
3. Non-sterile gloves.

Steps in the Procedure

Flushing to maintain patency of catheter:

1. Assemble supplies. Prime syringe.
2. Perform hand antisepsis. Don non-sterile gloves.
3. Clean end of needleless access device (end cap, access port) with alcohol wipe.
4. Attach prefilled saline syringe to access device.
5. Use push-pause technique to instill saline amount (per protocol). Leave 0.5 mL of saline in syringe.

continues on next page

6. Remove syringe. Clamp catheter.
7. Remove gloves. Dispose of syringe in sharps container.

Flushing before and after medication or fluid administration:

1. Repeat steps 1-5 above.
2. Attach medication/fluid and infuse as prescribed.
3. When medication/fluid is completed, flush with preservative-free 0.9% sodium chloride. Push at the same ordered rate as the medication. Leave 0.5 mL saline in syringe.
4. Remove syringe. Clamp catheter.
5. Remove gloves. Dispose of syringes in sharps container.

Documentation

1. Document procedure in treatment administration record.
2. Note location of catheter, condition of insertion site, and dressing in nurse’s notes.
3. Record any complications and/or communications with the physician in nurse’s notes.

Reporting

1. Report any complications to supervisor, oncoming shift, and physician (if necessary).
2. Report any other information per facility protocol.

Peripheral IV Catheter Insertion

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic insertion of a peripheral intravenous catheter for the administration of intravenous fluids and/or medications.

Definition

1. A peripheral short catheter is defined as a catheter that is less than 3 inches (7.5cm) in length. The tip of a peripheral short catheter ends in the peripheral vein.
2. A peripheral catheter can be winged, non-winged, or over the needle.

General Guidelines

Use of Peripheral Catheters

1. Selection of peripheral short catheters is based on prescribed therapies, duration of treatments (typically less than one week), availability of peripheral access sites, diagnosis, potential complications, and staff experience.
2. Therapies not appropriate for peripheral short catheters include continuous vesicant therapy, parenteral nutrition, or osmolarity >900 Osm/L.
3. The size of the cannula should be the smallest gauge and shortest length that will accommodate the therapy. This allows blood to circulate around catheter and helps to prevent phlebitis.

Site Selection

1. Initiate site selection in the distal areas of the upper extremities. Subsequent cannulation should be made proximal to previous catheter site.
2. Sites that are generally considered for peripheral cannulation are the dorsal and ventral surfaces of the upper extremity (metacarpal, cephalic, basilic, and median cubital).
3. When selecting insertion site avoid areas of flexion around wrist (within 4-5 inches) and antecubital areas. The back of the wrist is not an acceptable site of insertion.
4. Do not use lower extremity routinely in adults due to risk of tissue damage, embolism, ulceration and thrombophlebitis.
5. Avoid inserting the catheter in the right or left arm if that side of the body has been affected by the following:
 - a. History of breast surgery (e.g., mastectomy) with axillary node dissection;
 - b. Radiation therapy;
 - c. Lymphedema;
 - d. Flaccidity related to CVA; or
 - e. Existing or previous AV dialysis fistula (Consult with nephrologist before inserting catheter in the same arm).

continues on next page

6. Also avoid the following areas:
 - a. Previous venipuncture site;
 - b. Infiltrated, phlebitis, bruised areas;
 - c. Areas of pain on palpation;
 - d. Location of valves;
 - e. Areas of planned procedures;
 - f. Flexion areas; and/or
 - g. Bony prominences.

Hair Removal

1. Avoid shaving the site with a razor. Shaving can cause micro-abrasions or cuts in the skin. This can cause an increased risk of infection, bacterial growth, cellulitis, or phlebitis.
2. Hair may be clipped with aseptic safety scissors or electric clippers.
3. Remove hair only with resident consent prior to site preparation and catheter insertion.
4. Do not use depilatories, which may cause skin irritation.

Catheter Insertion

1. Catheter insertion is an aseptic procedure.
2. Do not attempt more than two cannulations per nurse.
3. Use one catheter for each cannulation attempt.
4. Methods to enlarge vein for easier visualization:
 - a. Place upper extremity below heart level to have more blood flow to area.
 - b. Place warm compress to area to dilate vein.
 - c. Have resident pump (open and close) the hand to make vein come closer to surface.
 - d. Lightly stroke the vein downward.
 - e. Do not slap the vein.
5. Apply tourniquet (single-resident use):
 - a. Should stay on less than 2 minutes to avoid vascular damage.
 - b. Should be snug-fitting, not tight.
 - c. Place 4 to 6 inches above insertion site to avoid too much pressure on the vein.

Dressings

1. Use sterile dressings (transparent or gauze, as appropriate) to cover insertion site.
2. Label on dressing should include date and time of dressing placement, initials, gauge size, and length of catheter.

Flushing

1. Use a syringe barrel size of 10 mL or larger when assessing patency of a peripheral short catheter.
2. Use normal saline (0.9% preservative-free sodium chloride) for flushing a peripheral short catheter. If medication is incompatible with NS, use 5% dextrose in water and follow with NS.
3. The volume of NS used for catheter flushing should be determined by the size of the catheter and type of infusion. It is recommended that the volume of flushing solution should equal at least twice the volume of the catheter system. For a peripheral short catheter, 2 to 5 mL of NS before and after infusion is generally adequate.
4. Lock (clamp) short peripheral catheters with normal saline, unless otherwise ordered.

continues on next page

Catheter Replacement or Removal

1. The decision to remove or replace the catheter should be based on an assessment of the resident and the situation, including:
 - a. Site;
 - b. Skin and vein integrity;
 - c. Length and type of therapy prescribed;
 - d. Integrity and patency of device;
 - e. Dressing; and
 - f. Stabilization device.
2. Remove the peripheral catheter if:
 - a. it has not been used for 24 hours;
 - b. there is suspected contamination;
 - c. there is an unresolved complication; and/or
 - d. therapy is discontinued.
3. If infection is suspected, notify the physician. Do not remove catheter until the need for culture or sampling is determined.
4. If the catheter was placed under emergency or suboptimal aseptic conditions, replace within 24-48 hours.

Equipment and Supplies

To start IV

1. Peripheral short catheter (1 or 2) (gauge and size per assessment);
2. IV start kit (non-sterile gloves, tourniquet, cleaning solution, tape, sterile gauze, transparent dressing, label);
3. Extension tubing with needleless access device (primed with saline);
4. 10 mL syringe prefilled with preservative-free 0.9% sodium chloride (normal saline); and
5. Absorbent pad.

If starting infusion

1. Prescribed IV solution/medication, IV pole, tubing, pump (if necessary);
2. Non-sterile gloves;
3. Chlorhexidine or alcohol wipes; and
4. Tape.

Steps in the Procedure

Note: There are several techniques for starting a catheter. All techniques include aseptic technique; using the best vein, smallest gauge and shortest length of catheter possible; proper securing of catheter; and using a sterile dressing. The steps that are listed below are to be used as a guide only.

1. Verify with state Nurse Practice Act for LPN/RN function and competency requirements.
2. A physician's order is necessary for this procedure.
3. Review the order and type of solution/medication to be infused.
4. Assemble equipment, open packages, prime extension tubing with saline (leave at least 3 mL of saline in syringe), tear tape, open catheter, and open cleaning solution packages.
5. Perform hand antisepsis.

continues on next page

6. Select venipuncture site:
 - a. Apply tourniquet to upper extremity to inspect potential sites of insertion.
 - b. Palpate extremity distal to tourniquet to assess vein condition.
 - c. Choose the most distal site possible, but proximal to previous insertion sites.
 - d. Avoid areas of flexion, bony prominence, existing phlebitis, bruises, or previous sites of infiltration.
7. Apply non-sterile gloves.
8. Prepare insertion site with cleansing agent (e.g., chlorhexidine solution, 70% alcohol, or 1 to 2% tincture of iodine, or approved combination solution) using proper technique per type of cleansing agent. Allow to air dry.
9. Insert catheter:
 - a. Stabilize vein below intended venipuncture site with non-dominant hand.
 - b. Insert catheter (bevel up) at a 10 to 30 degree angle.
 - c. When blood return is observed in flashback chamber, lower the angle of the catheter to 15 degrees and carefully advance into the center of vein.
10. Place gloved finger over tip of catheter (which is now under the skin) with slight pressure to prevent retrograde bleeding. Remove stylet.
11. Remove tourniquet.
12. Attach primed extension tubing to open end on hub of catheter. Flush with saline.
13. Observe insertion site for swelling (infiltration). If site swells, IV is unsuccessful and must be removed. Monitor resident for pain.
14. Place dressing over insertion site.
15. Coil the extension tubing on the side of catheter to prevent pulling on the catheter. Tape in place.
16. Discard stylet and syringes in sharps container. Discard gloves and other equipment properly. Wash hands.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time of the procedure.
2. The number of venipuncture attempts (maximum of two).
3. The type, length and gauge of catheter, and type of cleansing agent used.
4. The site of insertion (be specific to name of vein, area of arm).
5. The type of solution or medication infusing (if being used at this time).
6. The amount of solution or medication to be infused (if being used at this time).
7. The rate of infusion (if being used at this time).
8. The condition of the IV site.
9. Notification of the physician (if any complications).
10. Resident's response to procedure.
11. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the procedure or if procedure is unsuccessful.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.3 (H5MAPR0162)

Peripheral IV Dressing Changes

Level III

Purpose

This purpose of this procedure is to prevent catheter-related infections associated with contaminated, loosened or soiled catheter-site dressings.

General Guidelines

1. Apply and maintain transparent semi-permeable membrane (TSM) dressing or sterile gauze for all peripheral intravenous catheter sites.
2. Change the dressing if it becomes damp, loosened or visibly soiled and at least every 5 to 7 days. Change dressing and perform site care if signs and symptoms of site infection are present.
3. Remove the dressing from distal to proximal (towards the head), in the direction of the catheter insertion, to avoid accidentally removing catheter.
4. Use clean technique when performing this procedure.

Equipment and Supplies

1. Transparent semipermeable membrane (TSM) dressing;
2. Antiseptic cleaning solution; and
3. Non-sterile gloves.

Steps in the Procedure

1. Assemble equipment.
2. Perform hand antisepsis.
3. Remove old dressing from distal to proximal (towards the head) while placing pressure on the catheter to prevent dislodgement.
4. Clean insertion site with antiseptic solution per protocol.
5. Allow area to air dry.
6. Place new TSM dressing (with or without gauze) over insertion site. Smooth out dressing.
7. Label dressing with date, time, and initials.

Documentation

1. The following should be documented in the resident's medical record:
 - a. Date, time, type of dressing, and reason for dressing change.
 - b. Any complications/intervention related to insertion site or surrounding area.
 - c. Resident's response to procedure.

Reporting

1. Notify physician, supervisor, and/or oncoming shift of any complications/ interventions that were done.
2. Report other information in accordance with facility policy or professional standards of practice.

continues on next page

Removal of a Peripheral IV (Over the Needle, Peripheral Short) Catheter

Level III

Purpose

The purpose of this procedure is to provide guidelines for safe, aseptic removal of a peripheral IV catheter.

General Guidelines

1. Verify with state Nurse Practice Act for LPN/RN scope of practice and function and if a physician's order is required.
2. Replace peripheral IV catheter in an adult no more frequently than every 72 to 96 hours unless there is suspected contamination or complication.
3. The peripheral IV catheter is also removed when therapy is discontinued.
4. A peripheral IV catheter is defined as a catheter that is less than 3 inches (7.5cm) in length. It is also referred to as a peripheral short catheter, an over the needle catheter, saline lock, and angiocath.
5. Removing the peripheral catheter is an aseptic procedure.

Equipment and Supplies

1. Non-sterile gloves;
2. Alcohol wipes;
3. Sterile 2x2 gauze;
4. 1 syringe of normal saline (preservative-free 0.9% sodium chloride) per facility protocol for flush; and
5. Adhesive tape.

Steps in the Procedure

1. Verify if catheter is to be removed.
2. Assemble equipment.
3. Explain procedure to resident.
4. Perform hand antisepsis. Don non-sterile gloves.
5. Clean end of needleless access device with alcohol wipe.
6. Attach saline syringe. Flush catheter leaving 0.5 mL of saline in syringe.
7. Remove any tape that is on dressing or tubing.
8. Stabilize catheter hub with a finger.
9. Remove transparent dressing from distal to proximal (towards the head).
10. Place sterile gauze over catheter insertion site. *Do not apply pressure over site* at this time.
11. Pull catheter and extension tubing straight out of vein in a backward motion.
12. Apply pressure to gauze over insertion site. Hold for approximately one minute or until bleeding stops.
13. Place piece of adhesive tape over dressing.
14. Leave dressing on for 24 hours.
15. Dispose of catheter and extension tubing in sharps container. Dispose of papers and gloves in trash.
16. Perform hand antisepsis.
17. Assess resident for tolerance of procedure.

continues on next page

Documentation

1. The following should be documented in the resident's medical record:
 - a. Date, time of procedure, and resident tolerance.
2. Location of catheter that was removed.
3. Reason for removal of catheter (end of treatment, complication, rotation of site, etc.).
4. Any complications and interventions taken.
5. Any communication with physician or oncoming shift.
6. Change any areas needed on treatment kardex.

Reporting

1. Report to supervisor, physician, and oncoming shift any complications/problems.
2. Report any information per facility protocol.

Repairing Intravenous Catheters

Level III

Purpose

The purpose of this procedure is to establish guidelines for repairing intravenous catheters.

General Guidelines

1. Catheter repair is to be done only by Registered Nurses who have **proven clinical competency** in repairing intravenous access devices.
2. Verify with state Nurse Practice Act regulations regarding scope of practice and competency requirements for this procedure.
3. Not all catheter types can be considered for repair.
4. Access device repair is usually only considered for tunneled lines related to the fact that they are surgically placed and can stay in place for multiple years. Other types of catheters such as midline, non-tunneled, or PICC should be replaced rather than repaired.
5. Use only smooth clamps (without teeth) on catheters to avoid breaking the catheter.
6. Follow manufacturer’s instructions on how to replace hub area on catheter if cracked or broken.
7. Catheter must stay clamped and not used until part is fixed due to a high potential of air emboli or outward bleeding from the catheter.
8. A total breakage of the catheter is a *medical emergency*. The catheter could potentially enter the venous system and create an embolus.

Medication Utilization and Prescribing – Clinical Protocol

Assessment and Recognition

1. When a medication is prescribed for any reason, the physician and staff will identify the indications (condition or problem for which it is being given, or what the medication is supposed to do or prevent), considering the resident's age, medical and psychiatric conditions, risks, health status, and existing medication regimen.
 - a. Symptoms should be characterized in sufficient detail (onset, duration, frequency, intensity, location, etc.) to help identify whether a problem exists or whether a symptom is just a variation of normal.
 - b. A symptom (confusion, pain, etc.) may have diverse causes, so it is usually relevant to try to identify likely causes and pertinent non-pharmacologic interventions.
 - c. A diagnosis by itself may not be sufficient justification for prescribing a medication. The existence of a condition or risk does not necessarily require a treatment and the treatment may be something besides, or in addition to, medication.
2. As part of the overall review, the physician and staff will evaluate the rationale for existing medications that lack a clear indication or are being used intermittently on a PRN (as needed) basis.
3. The physician and staff will identify situations in which a resident is taking medications associated with potentially significant medication-related problems such as allergies, drug-drug interactions, drug-food interactions, and adverse drug reactions.
4. The physician and staff will identify significant factors that may affect medication effectiveness and medication-related problems; for example, someone with a high risk for falling who takes medications associated with an increased risk for falling, someone with impaired nutrition who is taking medications that affect appetite, or someone who cannot express thirst or is unable to drink without assistance who is taking diuretics and/or ACE inhibitors.
 - a. The consultant pharmacist can help by reviewing facility medication usage patterns and trends and by intensifying medication reviews of individuals taking medications that present clinically significant risks.

Cause Identification

1. For any new onset or clinically significant symptom (for example, loss of appetite or unplanned weight loss, fall, change in mental status/behavior, or otherwise unexplained decline in function) the physician and staff will review the possible contribution of one or more medications to the problem.
 - a. Many medications and medication combinations are associated with adverse consequences that resemble medical illnesses.
 - b. Adverse consequences of medications should always be considered when causes of any symptoms cannot be identified readily.
 - c. When medical causes of a patient's symptoms are not readily identifiable, a review for possible adverse medication consequences should occur before ordering additional medications to treat the identified symptoms.
 - d. There may be occasional exceptions when side effects are relatively unimportant; for example, the terminally ill individual for whom symptomatic relief has been identified as the primary goal.

continues on next page

2. The physician and staff will evaluate the effectiveness and effects of the medications in a resident's regimen.
3. The physician will participate in the facility's antibiotic stewardship protocols, including documentation of the clinical criteria for infection and laboratory reports of susceptibility, if necessary, when an antibiotic is ordered.
4. The consultant pharmacist should use the monthly and interim drug regimen review to help identify potentially problematic medications, including medication regimens that are not supported based on clinical signs or symptoms.

Treatment/Management

1. Based on input from the staff and resident, the physician will adjust medications based on their efficacy, indications and the continued presence of clinically significant risks.
2. The physician will provide and/or document a rationale when the indication, dose, duration, or frequency of a prescribed medication is greater than commonly accepted practice or the manufacturer's recommendations or the medication is considered high-risk compared to other available, relevant alternatives.
3. The staff and practitioners in collaboration with the consultant pharmacist will take into account medication-related issues such as food-drug interactions, effects of medication combinations, and drug-drug interactions.
4. The staff and physician will identify and address unexpected, unintended, undesirable or excessive responses to a medication based on the severity of underlying conditions, the seriousness of any adverse drug reactions, risks of worsening of medical conditions, and other factors.
 - a. This may include changing doses, changing times of administration, switching to another medication, or stopping one or more medications.
 - b. For example, a necessary medication that is causing daytime sedation could instead be administered in the evening so that peak side effects occur during sleep.
5. The physician will document a clinically pertinent rationale for not modifying a medication in a situation where an adverse drug reaction is likely.
6. The staff and physician will manage complications of adverse drug reactions appropriately.
7. In addition to medication adjustments, appropriate interventions might include additional support for someone with medication-related delirium or intensified efforts to feed and hydrate the individual with medication-induced anorexia.

Monitoring

1. The staff and physician will periodically re-evaluate the conditions and symptoms for which each resident is receiving medications to determine if the medication and doses are still relevant and are not causing undesired complications.
2. The staff and physician will monitor the progress of anyone with a probable adverse drug reaction and anyone for whom medications have been adjusted because of the possibility of an adverse drug reaction.
3. If the physician has stopped, tapered, or changed an existing medication, the staff will monitor for, document, and report any return of symptoms

Accepting Delivery of Medications

Policy Statement

1. All staff shall follow a consistent procedure in accepting medications.
2. Any errors noted in receiving medications shall be brought to the attention of the Pharmacist and Director of Nursing Services.

Policy Interpretation and Implementation

1. A nurse shall personally accept each medication delivery.
2. Before signing to accept the delivery, the nurse must reconcile the medications in the package with the delivery ticket/order receipt.
3. If an error is identified when receiving medications from the pharmacy, the nurse verifying the order shall:
 - a. inform the delivery agent of any discrepancies and note them on the delivery ticket;
 - b. return incorrect medications (e.g., wrong strength, form, etc.) to the dispensing pharmacy and reorder the correct medication;
 - c. if the number of a medication or packages of medications is incorrect, and the medication is **not** an emergency order, return the order to the pharmacy; and
 - d. if the number of a medication or packages of medications is incorrect, and the medication **is** an emergency order, accept the order and write that information onto the delivery ticket/order receipt.
4. A nurse shall sign the delivery ticket, indicating review and acceptance of the delivery, and shall keep a copy of the delivery ticket. Both the receiving nurse and the delivery agent must sign any notations about errors.
5. The delivery ticket shall be archived in a designated location.
6. The dispensing pharmacy, consultant pharmacist, and director of nursing services shall be notified of medication order errors.

Version	1.2 (H5MAPL0285)

Administering Medications

Policy Statement

Medications are administered in a safe and timely manner, and as prescribed.

Policy Interpretation and Implementation

1. Only persons licensed or permitted by this state to prepare, administer and document the administration of medications may do so.
2. The director of nursing services supervises and directs all personnel who administer medications and/or have related functions.
3. Staffing schedules are arranged to ensure that medications are administered without unnecessary interruptions.
4. Medications are administered in accordance with prescriber orders, including any required time frame.
5. Medication administration times are determined by resident need and benefit, not staff convenience. Factors that are considered include:
 - a. enhancing optimal therapeutic effect of the medication;
 - b. preventing potential medication or food interactions; and
 - c. honoring resident choices and preferences, consistent with his or her care plan.
6. Medication errors are documented, reported, and reviewed by the QAPI committee to inform process changes and or the need for additional staff training.
7. Medications are administered within one (1) hour of their prescribed time, unless otherwise specified (for example, before and after meal orders).
8. If a dosage is believed to be inappropriate or excessive for a resident, or a medication has been identified as having potential adverse consequences for the resident or is suspected of being associated with adverse consequences, the person preparing or administering the medication will contact the prescriber, the resident's attending physician or the facility's medical director to discuss the concerns.
9. The individual administering medications verifies the resident's identity before giving the resident his/her medications. Methods of identifying the resident include:
 - a. checking identification band;
 - b. checking photograph attached to medical record; and
 - c. if necessary, verifying resident identification with other facility personnel.
10. The individual administering the medication checks the label THREE (3) times to verify the right resident, right medication, right dosage, right time and right method (route) of administration before giving the medication.
11. The following information is checked/verified for each resident prior to administering medications:
 - a. Allergies to medications; and
 - b. Vital signs, if necessary.
12. The expiration/beyond use date on the medication label is checked prior to administering. When opening a multi-dose container, the date opened is recorded on the container.

continues on next page

13. Vials labeled as “single dose” or “single use” **are not** used on multiple residents. Such vials **are** used only for one resident in a single procedure.
14. Repackaging single use vials requires compliance with USP <797> standards. If there is a need to repackage unopened single dose/single use vials for use for more than one resident or procedure, the consultant pharmacist is contacted.
15. Medications that have been repackaged from unopened single-dose vials in accordance with USP <797> standards may be administered as repackaged single-dose/single use vials.
16. Insulin pens containing multiple doses of insulin are for single-resident use only. Changing the needle does not make it safe to use insulin pens for more than one resident.
17. Insulin pens **are** clearly labeled with the resident’s name or other identifying information. Prior to administering insulin with an insulin pen, the nurse verifies that the correct pen is used for that resident.
18. Post-exposure follow up procedures **are** conducted if an insulin pen is used for more than one resident.
19. During administration of medications, the medication cart is kept closed and locked when out of sight of the medication nurse or aide. It may be kept in the doorway of the resident’s room, with open drawers facing inward and all other sides closed. No medications are kept on top of the cart. The cart must be clearly visible to the personnel administering medications, and all outward sides must be inaccessible to residents or others passing by.
20. For residents not in their rooms or otherwise unavailable to receive medication on the pass, the MAR may be “flagged.” After completing the medication pass, the nurse will return to the missed resident to administer the medication.
21. If a drug is withheld, refused, or given at a time other than the scheduled time, the individual administering the medication shall initial and circle the MAR space provided for that drug and dose.
22. The individual administering the medication initials the resident’s MAR on the appropriate line after giving each medication and before administering the next ones.
23. As required or indicated for a medication, the individual administering the medication records in the resident’s medical record:
 - a. the date and time the medication was administered;
 - b. the dosage;
 - c. the route of administration;
 - d. the injection site (if applicable);
 - e. any complaints or symptoms for which the drug was administered;
 - f. any results achieved and when those results were observed; and
 - g. the signature and title of the person administering the drug.
24. Topical medications used in treatments are recorded on the resident’s treatment record (TAR).
25. Staff follows established facility infection control procedures (e.g., handwashing, antiseptic technique, gloves, isolation precautions, etc.) for the administration of medications, as applicable.
26. Medications ordered for a particular resident may not be administered to another resident, unless permitted by state law and facility policy, and approved by the director of nursing services.
27. Residents may self-administer their own medications only if the attending physician, in conjunction with the interdisciplinary care planning team, has determined that they have the decision-making capacity to do so safely.

continues on next page

28. If a resident uses PRN medications frequently, the attending physician and interdisciplinary care team, with support from the consultant pharmacist as needed, shall reevaluate the situation, examine the individual as needed, determine if there is a clinical reason for the frequent PRN use, and consider whether a standing dose of medication is clinically indicated.
29. New personnel authorized to administer medications are not permitted to prepare or administer medications until they have been oriented to the medication administration system used by the facility.
30. The charge nurse must accompany new nursing personnel on their medication rounds for a minimum of three (3) days to ensure established procedures are followed and proper resident identification methods are learned.
31. Each nurses' station has a current *Physician's Desk Reference* (PDR) and/or other medication reference, as well as a copy of the surveyor guidance for F755-761 (Pharmacy Services) available. Manufacturer's instructions or user's manuals related to any medication administration devices are kept with the devices or at the nurses' station.

Adverse Consequences and Medication Errors

Policy Statement

The interdisciplinary team evaluates medication usage in order to prevent and detect adverse consequences and medication-related problems such as adverse drug reactions (ADRs) and side effects. Adverse consequences shall be reported to the attending physician and pharmacist, and to federal agencies as appropriate.

Policy Interpretation and Implementation

1. Residents receiving any medication that has a potential for an adverse consequence will be monitored to ensure that any such consequences are promptly identified and reported.
2. An “adverse consequence” is defined as an unpleasant symptom or event that is due to or associated with a medication, such as an impairment or decline in an individual’s mental or physical condition or functional or psychosocial status. An adverse consequence may include:
 - a. adverse drug/medication reaction;
 - b. side effect;
 - c. medication-medication interaction; or
 - d. medication-food interaction.
3. An “adverse drug reaction” (ADR), a form of adverse consequences, is defined as a secondary and usually undesirable effect of a drug and is different from the therapeutic and helpful effects of the drug. An ADR is any noxious and unintended response to a drug and occurs in doses for prophylaxis, diagnosis or therapy.
4. The staff and practitioner shall strive to minimize adverse consequences by:
 - a. following relevant clinical guidelines and manufacturer’s specifications for use, dose, administration, duration, and monitoring of the medication;
 - b. defining appropriate indications for use; and
 - c. determining that the resident:
 - (1) has no known allergies to a medication;
 - (2) is not taking other medications, nutritional supplements including herbal products, or foods that would be incompatible with the prescribed medication; and
 - (3) has no condition, history, or sensitivities that would preclude use of that medication.
5. A “medication error” is defined as the preparation or administration of drugs or biological which is not in accordance with physician’s orders, manufacturer specifications, or accepted professional standards and principles of the professional(s) providing services.
6. Examples of medications errors include:
 - a. omission – a drug is ordered but not administered;
 - b. unauthorized drug – a drug is administered without a physician’s order;
 - c. wrong dose (*e.g., Dilantin 12 mL ordered, Dilantin 2 mL given*);
 - d. wrong route of administration (*e.g., ear drops given in eye*);
 - e. wrong dosage form (*e.g., liquid ordered, capsule given*);
 - f. wrong drug (*e.g., vibramycin ordered, vancomycin given*);
 - g. wrong time; and/or

continues on next page

- h. failure to follow manufacturer instructions and/or accepted professional standards (e.g., failure to shake medication that is labeled “shake well,” crushing a medication on the “do not crush list” without an order).
7. The interdisciplinary team reviews the resident’s medication regimen for efficacy and actual or potential medication-related problems on an ongoing basis.
8. When a resident receives a new medication, the medication order is evaluated for the following:
 - a. The dose, route of administration, duration, and monitoring are in agreement with current clinical practice, clinical guidelines, and/or manufacturer’s specifications for use.
 - b. A written diagnosis/indication supporting the use of the medication.
 - c. The resident has no known allergies to the medication.
 - d. Presence of a boxed warning for specific side effect(s).
 - e. The resident is not taking other medications, nutritional supplements, including herbal products, or foods that would be incompatible with the prescribed medication.
 - f. The resident does not have a condition, history, or sensitivity that would preclude the use of the medication.
 - g. The prescriber documents the clinical rationale for using a medication outside these stated guidelines.
9. Facility staff monitor the resident for possible medication-related adverse consequences, including mental status and level of consciousness, when the following conditions occur:
 - a. A clinically significant change in condition/status:
 - (1) An unexplained decline in function or cognition.
 - (2) A worsening of an existing problem or condition.
 - (3) A new or worsening psychiatric manifestation or distressed behavior.
 - (4) Acute onset of signs or symptoms or worsening of a chronic problem or condition.
 - b. Addition or discontinuation of medications and/or non-pharmacologic interventions.
 - c. Change in dose.
 - d. Addition or discontinuation of care and services such as enteral feedings.
 - e. Significant changes in diet that may affect medication absorption.
 - f. Medication error, e.g., wrong or expired medication.
10. When any of the above occurs, the prescriber and/or staff rule out medication as a cause and document it in the resident’s clinical record.
 - a. A review of medications as potential causes of permanent significant change that requires a significant change of status MDS assessment should be performed within the required 14-day observation period.
11. The facility staff monitors residents taking certain combinations of medications (consult current list of dangerous medication interactions) for possible adverse consequences and/or the need to modify the dose of one or more medications. The prescriber documents why or how these medications’ benefits outweigh their risks in the resident’s clinical record.
12. In the event of a significant medication-related error or adverse consequence, immediate action is taken, as necessary, to protect the resident’s safety and welfare. Significant is defined as:
 - a. requiring medication discontinuation or dose modification (A current list of medications that should not be abruptly discontinued should be consulted before discontinuing a medication.);
 - b. requiring hospitalization, or extending a hospitalization;
 - c. resulting in disability;
 - d. requiring treatment with a prescription medication;

continues on next page

- e. resulting in cognitive deterioration or impairment;
 - f. life threatening; and/or
 - g. resulting in death.
13. The attending physician is notified promptly of any significant error or adverse consequence.
 - a. The physician’s orders are implemented, and the resident is monitored closely for 24 to 72 hours or as directed.
 14. The incident is described on the shift change report to alert staff of the need to monitor the resident.
 15. The following information is documented in an incident report and in the resident’s clinical record:
 - a. Factual description of the error or adverse consequence.
 - b. Name of physician and time notified.
 - c. Physician’s subsequent orders.
 - d. Resident’s condition for 24 to 72 hours or as directed.
 16. Each incident report is forwarded to the:
 - a. director of nursing;
 - b. quality assurance nurse;
 - c. medical director; and
 - d. consultant pharmacist.
 17. Data regarding medication adverse consequences and errors (e.g., total number of incidents, number of incidents by category/type, trends) will be compiled and presented to the quality assurance and performance improvement committee on a monthly or quarterly basis.
 18. The QAPI committee will conduct a root cause analysis of medication administration errors to determine the source of errors, implements process improvement steps, and compare results over time to determine that system improvements are effective in reducing errors.

Controlled Substances

Policy Statement

The facility complies with all laws, regulations, and other requirements related to handling, storage, disposal, and documentation of controlled medications.

Policy Interpretation and Implementation

1. Only authorized licensed nursing and/or pharmacy personnel have access to controlled drugs maintained on premises.
2. Personnel who are authorized to handle controlled substances are approved by the director of nursing services.
3. Controlled substances are stored in the medication room in a locked container, separate from containers for any non-controlled medications.
4. Access to controlled medications remains locked at all times and access is recorded.
5. The director of nursing services maintains a list of personnel who have access to medication storage areas and controlled substance containers.
6. Keys to controlled substance containers are kept on a single key ring separate from any other keys.
7. The charge nurse on duty maintains the keys to controlled substance containers. The director of nursing services maintains a set of back-up keys for all medication storage areas including keys to controlled substance containers.
8. Controlled substances are reconciled upon receipt, administration, disposition, and at the end of each shift.
9. **Upon Receipt:**
 - a. The nurse receiving the medication and the individual delivering the medication verify the name, dose and quantity of each controlled substance being delivered.
 - b. Both individuals sign the controlled substance record of receipt.
 - c. An individual resident controlled substance record is made for each resident who is receiving a controlled substance. The record contains:
 - (1) name of the resident;
 - (2) name and strength of the medication;
 - (3) quantity received;
 - (4) number on hand;
 - (5) name of physician;
 - (6) prescription number;
 - (7) name of issuing pharmacy; and
 - (8) date and time received.
 - d. Controlled medications that are designated for emergency or on hand supply are recorded as such.
10. **Upon Administration:**
 - a. The nurse administering the medication is responsible for recording:
 - (1) name of the resident receiving the medication;
 - (2) name, strength and dose of the medication;

continues on next page

- (3) time of administration;
- (4) method of administration;
- (5) quantity of the medication remaining; and
- (6) signature of nurse administering medication.

11. Upon Disposition:

- a. Unless otherwise instructed by the director of nursing services, when a resident refuses a non-unit dose medication (or it is not given), or a resident receives partial tablets or single dose ampules (or it is not given), the medication may not be returned to the container.
- b. Medications that are opened and subsequently not given (refused or only partly administered) are destroyed. Waste and/or disposal of controlled medication are done in the presence of the nurse and a witness who also signs the disposition sheet.
- c. Medications returned to the pharmacy are recorded and signed by the director of nursing (or designee) and the receiving pharmacy.

12. At the End of Each Shift:

- a. Controlled medications are counted at the end of each shift. The nurse coming on duty and the nurse going off duty determine the count together.
- b. Any discrepancies in the controlled substance count are documented and reported to the director of nursing services immediately.
- c. The director of nursing services investigates all discrepancies in controlled medication reconciliation to determine the cause and identify any responsible parties, and reports the findings to the administrator.
- d. The director of nursing services consults with the provider pharmacy and the administrator to determine whether further legal action is indicated.

13. In the event there is concern about controlled substances being discharged with the resident and/or resident’s representative, the attending physician may choose not to discharge the resident with those medications.

14. Policies and procedures for monitoring controlled medications to prevent loss, diversion or accidental exposure are periodically reviewed and updated by the director of nursing services and the consultant pharmacist.

Crushing Medications

Policy Statement

Medications shall be crushed only when it is appropriate and safe to do so, consistent with physician orders.

Policy Interpretation and Implementation

1. The medical director and director of nursing services, in conjunction with the consultant pharmacist, shall identify appropriate indications and procedures for crushing medications.
2. The nursing staff and/or consultant pharmacist shall notify any attending physician who gives an order to crush a drug that the manufacturer states should not be crushed (for example, long-acting or enteric coated medications).
 - a. The attending physician or consultant pharmacist must identify an alternative medication and/or dosage form; or
 - b. The attending physician must document (or provide the nurses with a clinically pertinent reason to document) why crushing the medication will not adversely affect the resident; or
 - c. The facility or practitioner must provide literature from the manufacturer or peer-reviewed journal to justify why modification of the dosage form will not compromise resident care; and
 - d. When such a medication is administered, the facility staff will observe the resident for pertinent adverse effects.
3. In addition, the following guidelines shall be followed when crushing medications:
 - a. The MAR or other documentation must indicate why it was necessary to crush the medication.
 - b. Use only the mortar and pestle or garlic-press type crusher in the drug preparation area to crush medications. If a paper cup is used, be sure that the paper cup is not ground into the medication.
 - c. Should it become necessary to crush a drug without a cup or other protective device, thoroughly clean the crusher after each use.
 - d. Crushing each medication separately and administering each with food is considered best practice. However, separating and administering crushed medication is not appropriate for all residents. Issues related to safety, needs, preferences, medication schedule, and functional ability will determine the most resident-centered approach.

Discarding and Destroying Medications

Policy Statement

Medications will be disposed of in accordance with federal, state and local regulations governing management of non-hazardous pharmaceuticals, hazardous waste and controlled substances.

Policy Interpretation and Implementation

1. All unused controlled substances shall be retained in a securely locked area with restricted access until disposed of.
2. Non-controlled and Schedule V (non-hazardous) controlled substances will be disposed of in accordance with state regulations and federal guidelines regarding disposition of non-hazardous medications.
3. Unless otherwise prohibited under applicable federal or state laws, individual resident medications supplied in sealed unopened containers may be returned to the issuing pharmacy for disposition provided that:
 - a. all such medications are identified as to lot or control number; and
 - b. the receiving pharmacist and a registered nurse employed by the facility sign a separate log that lists the resident's name; the name, strength, prescription number (if applicable) and amount of the medication returned; and the date the medication was returned.
4. Schedule II, III, and IV (non-hazardous) controlled substances will be disposed of in accordance with state regulations and federal guidelines regarding disposition of non-hazardous controlled medications.
5. The facility may contract with a DEA registered collector for proper disposal of non-hazardous schedule II, III, IV and V controlled substances.
6. Should the facility contract with a DEA-registered collector, controlled substances may be disposed of in an authorized collection receptacle located at the facility.
 - a. If a resident is transferred to another facility, or dies while he or she is in lawful possession of controlled substances, the facility may dispose of the controlled substance(s) by depositing in the authorized on-site collection receptacle.
 - b. Family members, or other persons lawfully entitled to dispose of the resident's property may also dispose of the resident's controlled substances.
 - c. Disposal of controlled substances must take place immediately (no longer than three days) after discontinuation of use by the resident.
 - d. Both controlled and non-controlled substances may be disposed of in the collection receptacle.
 - e. The collector will be responsible for managing the collection receptacles, including picking up and properly disposing of medications collected in the receptacles and training facility staff on the procedures associated with collection and storage of controlled substances awaiting disposal.
7. For unused, non-hazardous controlled substances that are not disposed of by an authorized collector, the EPA recommends destruction and disposal of the substance with other solid waste following the steps below:
 - a. Take the medication out of the original containers.

continues on next page

- b. Mix medication, either liquid or solid, with an undesirable substance. Undesirable substances include sand, coffee grounds, kitty litter, or other absorbent materials. Place the waste mixture in a sealable bag, empty can, or other container to prevent leakage.
 - c. Dispose with the solid waste (i.e., regular trash) in the presence of two witnesses.
 - d. Document the disposal on the medication disposition record.
 - e. Include the signature(s) of at least two witnesses.
8. Destruction of a controlled substance must render it “non-retrievable,” meaning that the process permanently alters the physical or chemical properties of the substance so that it is no longer available or usable, and cannot be illegally diverted.
 9. Any controlled substance that is considered hazardous waste will be managed in accordance with federal, state and local hazardous waste regulations, as well as the Controlled Substance Act and DEA regulations.
 10. Ointments, creams, and other like substances may be discarded into the trash receptacle in the medication room.
 11. The medication disposition record will contain the following information:
 - a. The resident’s name;
 - b. Date medication disposed;
 - c. The name and strength of the medication;
 - d. The name of the dispensing pharmacy;
 - e. The quantity disposed;
 - f. Method of disposition;
 - g. Reason for disposition; and
 - h. Signature of witnesses.
 12. Completed medication disposition records shall be kept on file in the facility for at least two (2) years, or as mandated by state law governing the retention and storage of such records.
 13. For emergency kit controlled substances disposal, complete the appropriate portions of the controlled medication accountability form.
 14. Staff shall contact the provider pharmacy if they are unsure of proper disposal methods for a medication.

Discontinued Medications

Policy Statement

Staff shall destroy discontinued medications or shall return them to the dispensing pharmacy in accordance with facility policy.

Policy Interpretation and Implementation

1. A practitioner’s order to discontinue a resident’s medication must be documented in the resident’s clinical record and on the medication administration record (MAR).
2. The nurse receiving the order to discontinue a medication is responsible for recording the information (e.g., writing discontinued date, dating and initialing MAR) and notifying the dispensing pharmacy of the discontinuation.
3. Discontinued medications must be destroyed or returned to the issuing pharmacy in accordance with established policies.

Dispensing Medications to Residents on Leave/Pass

Policy Statement

The facility shall provide residents with necessary medication(s) when they leave the facility temporarily.

Policy Interpretation and Implementation

1. Residents who are away from the facility during medication passes will be given scheduled and essential PRN medication(s) to take with them. They will only be given the amounts and dosages needed for the length of the anticipated absence.
2. The charge nurse will provide verbal and written directions to the resident and/or the person signing out the resident regarding any dispensed medications.
3. The nursing staff will document the resident's absence from the facility on the resident's medication administration record (MAR), if the resident is absent during one or more medication passes.
4. If a resident is on leave or pass overnight or for more than three (3) consecutive days, the pharmacy shall prepare and dispense his/her medications.

Documentation of Medication Administration

Policy Statement

The facility shall maintain a medication administration record to document all medications administered.

Policy Interpretation and Implementation

1. A nurse or certified medication aide (where applicable) shall document all medications administered to each resident on the resident’s medication administration record (MAR).
2. Administration of medication must be documented immediately after (never before) it is given.
3. Documentation must include, as a minimum:
 - a. name and strength of the drug;
 - b. dosage;
 - c. method of administration (e.g., oral, injection (and site), etc.);
 - d. date and time of administration;
 - e. reason(s) why a medication was withheld, not administered, or refused (as applicable);
 - f. signature and title of the person administering the medication; and
 - g. resident response to the medication, if applicable (e.g., PRN, pain medication, etc.).

Version	1.1 (H5MAPL0220)

Hazardous Waste Pharmaceuticals

Policy Statement

Pharmaceutical waste that is designated as hazardous by the Environmental Protection Agency is managed in accordance with regulations governing hazardous waste pharmaceuticals (HWP).

Policy Interpretation and Implementation

1. A “pharmaceutical” is defined as: “any drug or dietary supplement for use by humans or other animals; any electronic nicotine delivery system; or any liquid nicotine packaged for retail sale for use in electronic nicotine delivery systems. This definition includes, but is not limited to: over the counter drugs, homeopathic drugs, compounded drugs, investigational new drugs, pharmaceuticals remaining in non-empty containers, personal protective equipment contaminated with pharmaceuticals, and clean-up material from spills of pharmaceuticals.”
2. Waste is considered “hazardous” if it meets a listing or exhibits a characteristic (ignitability, corrosivity, reactivity, or toxicity) described in 40 CFR Part 261 Subpart C or D.
3. Hazardous waste pharmaceuticals generated by this facility are managed in accordance with the *Resource Conservation and Recovery Act* regulations at 40 CFR Part 266 (Subpart P) specific to healthcare facilities.
4. Unused and expired pharmaceuticals may be disposed of through a contracted reverse distributor, which is defined as: “any person that receives and accumulates prescription pharmaceuticals that are potentially creditable hazardous waste pharmaceuticals for the purpose of facilitating or verifying manufacturer credit. Any person, including forward distributors, third-party logistics providers, and pharmaceutical manufacturers, that processes prescription pharmaceuticals for the facilitation or verification of manufacturer credit is considered a reverse distributor.”
5. Any HWP that is to be sent off site for reverse distribution is managed as hazardous waste while still at the facility.
6. No HWP may be discarded down the toilet or the drain. Although over the counter nicotine replacement therapies (patches, gum or lozenges) are not considered HWP, disposing of these into the sewer system is discouraged.
7. The environmental services director, in addition to the administrator, is responsible for determining the presence and amount of HWP generated by the facility, its status as a generator, and its subsequent obligations under 40 CFR Part 266 (Subpart P).
 - a. A very small quantity generator (VSQG) generates less than 220 pounds (100 kg) of hazardous waste OR 2.2 pounds (1 kg) of acute hazardous waste¹ and is not subject to the requirements.
 - b. A large quantity generator (LQG) accumulates more than 100 kg of hazardous waste OR more than 1 kg of acute hazardous waste and is subject to the requirements.

continues on next page

1. “Acute Hazardous Waste” is a HWP found to be particularly toxic or is otherwise capable of causing or significantly contributing to an increase in serious (irreversible or incapacitating reversible) illness. All P-listed wastes and certain F-listed wastes—F020, F021, F022, F023, F026, and F027—are “acute.”

8. If the facility is subject to the requirements under 40 CFR Part 266 (Subpart P), the following are established under the hazardous waste pharmaceutical management program:
 - a. How quantities of HWP generation are calculated;
 - b. Electronic notification to the EPA that the facility is subject to the requirements of Subpart P;
 - c. Training on the handling of HWP, including emergency procedures, that is specific and relevant to responsibilities;
 - d. Physical properties and labeling requirements for containers that are intended to store HWPs;
 - e. Methods for determining accumulation time (maximum one year);
 - f. Shipping requirements, including:
 - (1) packaging, labeling and marking;
 - (2) placarding according to DOT requirements;
 - (3) manifest forms;
 - (4) interstate requirements; and
 - (5) managing rejected shipments.
 - g. Recordkeeping;
 - h. Response and management of spills; and
 - i. Managing potentially creditable HWPs.

Irrigation Solutions

Policy Statement

Irrigation solutions shall be stored, used, and destroyed in accordance with directions on the container label.

Policy Interpretation and Implementation

1. Irrigation solution containers must be labeled immediately upon opening. The label must contain the **date** and **time** the container was opened.
2. Irrigation solutions prepared by the pharmacy must contain an expiration date not to exceed seven (7) days from the date of its preparation.
3. Unused irrigation solutions must be disposed of within seventy-two (72) hours of opening the container.
4. Unused irrigation solutions not containing preservatives must be disposed of within twenty-four (24) hours of opening the container.
5. Irrigation solutions may be poured down the commode or lavatory. Unless otherwise instructed, it is not necessary to record the disposal of partial containers.

Labeling of Medication Containers

Policy Statement

All medications maintained in the facility are properly labeled in accordance with current state and federal guidelines and regulations.

Policy Interpretation and Implementation

1. Medication labels must be legible at all times.
2. Any medication packaging or containers that are inadequately or improperly labeled are returned to the issuing pharmacy.
3. Labels for individual resident medications include all necessary information, such as:
 - a. the resident's name;
 - b. the prescribing physician's name;
 - c. the name, address, and telephone number of the issuing pharmacy;
 - d. the name, strength, and quantity of the drug;
 - e. the prescription number (if applicable);
 - f. the date that the medication was dispensed;
 - g. appropriate accessory and cautionary statements;
 - h. the expiration date when applicable; and
 - i. directions for use.
4. Labels for stock medications include all necessary information, such as:
 - a. the name and strength of the drug;
 - b. the lot and control number;
 - c. the expiration date when applicable;
 - d. appropriate accessory and cautionary statements; and
 - e. directions for use.
5. Labels for each single unit dose package include all necessary information, such as:
 - a. the name and strength of the drug;
 - b. the lot or control number;
 - c. the date drug dispensed;
 - d. appropriate accessory and cautionary statements;
 - e. the expiration date when applicable;
 - f. the name of the resident and physician. (Note: The names of the resident and physician do not have to be on each unit dose package, but they must be identified with the package in such a manner as to ensure that the drug is administered to the right resident);
 - g. the prescription number;
 - h. the name, address, and telephone number of pharmacy dispensing the drug; and
 - i. directions for use.

continues on next page

6. Labels for over-the-counter drugs include all necessary information, such as:
 - a. the original label indicating the name, strength and quantity of the medication;
 - b. the expiration date when applicable; and
 - c. directions for use and appropriate accessory/cautionary statements.
7. Only the dispensing pharmacy can label or alter the label on a medication container or package.
8. Medications may not be transferred between containers.
9. The nursing staff must inform the pharmacy of any changes in physician orders for a medication.

Medication/Food Interaction

Policy Statement

Medication orders shall be reviewed for possible food/medication interactions.

Policy Interpretation and Implementation

1. The consultant pharmacist, nurses, and physician shall review medications ordered for each resident to determine if medications interact with food, beverages, or another medication that has been prescribed for the resident.
2. If a medication is identified as having a known interaction with food or medications currently prescribed for the resident, the individual who identifies the interaction shall contact the attending physician about the potential interaction.
3. Nursing staff will record on the resident’s care plan any foods that could cause clinically significant interaction.
4. Food services staff will assure that foods that may cause clinically significant interactions are omitted from meals for those individuals with medication-food interactions.
5. When a resident has an order allowing him/her to drink alcoholic beverages, the pharmacist shall identify any of the resident’s current medications that interact with alcohol, and shall notify the nursing staff and/or physician with that information.
6. The nursing staff shall contact the resident’s attending physician and inform him/her of any food/medication interactions that occur with the resident.
7. The staff shall document the attending physician’s instructions about how to avoid or manage any interactions.
8. The medical director shall periodically review significant adverse medication consequences, including major food/medication interactions, and discuss them with attending physicians and the consultant pharmacist, as needed.

Medication Administration Schedule

Policy Statement

Medications are administered according to established schedules.

Policy Interpretation and Implementation

1. Medications are administered according to the following routine schedule:

Ordered Times	Administration Schedule
q8h (every eight hours)	___ a.m. / ___ p.m. / ___ p.m.
q6h (every six hours)	___ a.m. / ___ a.m. / ___ p.m. / ___ p.m.
q4h (every four hours)	___ a.m. / ___ a.m. / ___ a.m. / ___ p.m. / ___ p.m. / ___ p.m.
qid (four times daily)	___ a.m. / ___ a.m. / ___ p.m. / ___ p.m.
tid (three times daily)	___ a.m. / ___ p.m. / ___ p.m.
bid (two times daily)	___ a.m. / ___ p.m.
ac (before meals)	___ a.m. / ___ a.m. / ___ p.m.
pc (after meals)	___ a.m. / ___ p.m. / ___ p.m.
Daily	___ a.m.
Every morning	___ a.m.
Insulin (daily)	___ a.m.
Insulin (twice daily)	___ a.m. / ___ p.m.

2. Routine medication administration schedules may be changed by the quality assurance and performance improvement committee.
3. Scheduled medications are administered within one (1) hour of their prescribed time, unless otherwise specified.
4. Scheduled medications designated as time-critical (medications that may cause harm or sub-therapeutic effect if administered before or after the scheduled time) are administered at the scheduled time (for example, rapid-acting insulin) or within 30 minutes of the scheduled time.
5. Time critical medications are designated by the pharmacy and include:
 - a. medications that are scheduled more than every four hours;
 - b. scheduled opioids used for chronic pain or palliative care;
 - c. immunosuppressive agents used for organ transplant rejection or to treat myasthenia gravis;
 - d. medications that need to be administered apart from other medications; and
 - e. medications that need to be administered before, with, or after meals.
6. Scheduled medications that must be given around mealtimes may fluctuate based on delivery and consumption of meals.

continues on next page

7. The exact time of medication administration is documented in the MAR. If medication is administered early, late (beyond the allowable interval), or is omitted, the reason is also documented.
8. A physician's order for specific times supersedes any routine schedule.
9. Residents may request alternate medication schedules. Such times must be documented on the resident's medication administration record and care plan.

Medication Holds

Policy Statement

Temporary medication holds may be ordered by the resident's attending physician.

Policy Interpretation and Implementation

1. A hold order for a medication must be accompanied by a restart date or time. Hold orders without a restart date or time will be considered discontinued.
2. When medications are held, they must be stored in a separate location in the medication room or returned to the issuing pharmacy.
3. The nursing staff must document in the resident's medication administration record (MAR) that such medication(s) is being held.
4. The attending physician must provide an explicit order as to when to restart a medication that has been held, either at the time the order is given to hold the medication or subsequently. If the medication was discontinued, a new order must be given.

Medication Recalls

Policy Statement

Our facility shall honor medication recall notifications.

Policy Interpretation and Implementation

1. The dispensing pharmacy and/or consultant pharmacist will notify the facility of any medication recalls.
2. Upon receiving a medication recall notification from any reliable source:
 - a. the director of nursing services or the consultant pharmacist will inspect the facility’s medical supplies for the recalled item; and
 - b. if the recall item is in stock, it will be removed from the inventory and returned to the supplier in accordance with the recall notice.
3. The director of nursing services, or designee, will document inventory records concerning removal of such supplies.
4. In conjunction with the consultant pharmacist, the director of nursing services and medical director will ensure that all nurses and attending physicians are informed that a medication has been recalled, and will identify any specific precautions that should be followed, or symptoms that might result from the medication.
5. Nursing staff will withhold known recalled medications and will notify a physician promptly. They will ask the physician for an order to discontinue the medication, and discuss whether another medication is indicated and whether they should take any measures (e.g., intensified monitoring, lab tests, etc.) related to the recalled medication.
6. The nursing staff will closely monitor individuals who have been taking a recalled medication for problematic signs and symptoms for at least 24 hours after the last dose is given, or longer if indicated by the recall notice or the anticipated duration of effects or side effects of the recalled medication.

Medication Therapy

Policy Statement

1. Each resident's medication regimen shall include only those medications necessary to treat existing conditions and address significant risks.
2. Medication use shall be consistent with an individual's condition, prognosis, values, wishes, and responses to such treatments.
3. All medication orders will be supported by appropriate care processes and practices.

Policy Interpretation and Implementation

1. The resident's clinical record must contain a written order for all prescription and over-the-counter medications taken by the resident.
2. All decisions related to medications shall include appropriate elements of the care process, such as:
 - a. adequately detailed assessment;
 - b. review of causes of symptoms;
 - c. consideration of the clinical relevance of symptoms and abnormal diagnostic test results;
 - d. principles of prescribing for the elderly; and
 - e. each resident's wishes, values, goals, condition, and prognosis.
3. Upon or shortly after admission, and periodically thereafter, the staff and practitioner (assisted by the consultant pharmacist) will review an individual's current medication regimen, to identify whether:
 - a. there is a clear indication for treating that individual with the medication;
 - b. the dosage is appropriate;
 - c. the frequency of administration and duration of use are appropriate; and
 - d. potential or suspected side effects are present.
4. Periodically, and when circumstances are present that represent a greater risk for medication-related complications, the staff and practitioner will review the medication regimen for continued indications, proper dosage and duration, and possible adverse consequences.
5. The physician will identify situations where medications should be tapered, discontinued, or changed to another medication, for example:
 - a. when a medication is being given in excessive doses, for excessive periods of time, without adequate monitoring, or in the absence of a valid clinical rationale;
 - b. when the results of ongoing assessment, or the presence of clinically significant adverse consequences monitoring, suggest that a medication should be reduced or discontinued entirely; and
 - c. when a medication is being prescribed to treat, or in anticipation of, an adverse consequence of another prescribed drug.
6. The consultant pharmacist shall review each resident's medication regimen monthly, as requested by the staff or practitioner, or when a clinically significant adverse consequence is confirmed or suspected.
7. The facility shall review medication-related issues as part of its quality assurance and performance improvement committee and activities.

continues on next page

8. The medical director and consultant pharmacist shall collaborate to address issues of medication prescribing and monitoring with the practitioners and staff.

Safety Data Sheets (SDS) – Pharmacy

Policy Statement

The dispensing pharmacy shall provide a copy of the safety data sheets (SDSs) for all hazardous medications dispensed by the dispensing pharmacy, as defined by the Occupational Safety and Health Administration (OSHA).

Policy Interpretation and Implementation

1. The pharmacy shall provide SDSs and informational updates, as appropriate, for all medications that are considered hazardous.
2. An SDS must accompany the first delivery of the medication.
3. After the initial delivery, the SDS does not have to be redistributed unless there is a change in the SDS.

Security of Medication Cart

Policy Statement

The medication cart shall be secured during medication passes.

Policy Interpretation and Implementation

1. The nurse must secure the medication cart during the medication pass to prevent unauthorized entry.
2. The medication cart should be parked in the doorway of the resident’s room during the medication pass. The cart doors and drawers should be facing the resident’s room.
3. When it is not possible to park the medication cart in the doorway, the cart should be parked in the hallway against the wall with doors and drawers facing the wall. The cart must be locked before the nurse enters the resident’s room.
4. Medication carts must be securely locked at all times when out of the nurse’s view.
5. When the medication cart is not being used, it must be locked and parked at the nurses’ station or inside the medication room.

Self-Administration of Medications

Policy Statement

Residents have the right to self-administer medications if the interdisciplinary team has determined that it is clinically appropriate and safe for the resident to do so.

Policy Interpretation and Implementation

1. As part of the evaluation comprehensive assessment, the interdisciplinary team (IDT) assesses each resident's cognitive and physical abilities to determine whether self-administering medications is safe and clinically appropriate for the resident.
2. The IDT considers the following factors when determining whether self-administration of medications is safe and appropriate for the resident:
 - a. The medication is appropriate for self-administration;
 - b. The resident is able to read and understand medication labels;
 - c. The resident can follow directions and tell time to know when to take the medication;
 - d. The resident comprehends the medication's purpose, proper dosage, timing, signs of side effects and when to report these to the staff;
 - e. The resident has the physical capacity to open medication bottles, remove medications from a container and to ingest and swallow (or otherwise administer) the medication; and
 - f. The resident is able to safely and securely store the medication.
3. If it is deemed safe and appropriate for a resident to self-administer medications, this is documented in the medical record and the care plan. The decision that a resident can safely self-administer medications is re-assessed periodically based on changes in the resident's medical and/or decision-making status.
4. If the team determines that a resident cannot safely self-administer medications, the nursing staff administer the resident's medications. The IDT evaluates options which allow residents to safely participate in the medication administration process if they wish to do so.
5. Residents who are identified as being able to self-administer medications are asked whether they wish to do so.
6. For self-administering residents, the nursing staff determines who is responsible (the resident or the nursing staff) for documenting that medications are taken.
7. If the resident is able and willing to take responsibility for documenting self-administration of medications, the resident is instructed on how to complete a record indicating the administration of the medication.
8. Self-administered medications are stored in a safe and secure place, which is not accessible by other residents. If safe storage is not possible in the resident's room, the medications of residents permitted to self-administer are stored on a central medication cart or in the medication room. A licensed nurse transfers the unopened medication to the resident when the resident requests them.
9. Any medications found at the bedside that are not authorized for self-administration are turned over to the nurse in charge for return to the family or responsible party.

continues on next page

10. The facility reorders self-administered medications in the same manner as other medications.
11. The nursing staff routinely checks self-administered medications and removes expired, discontinued, or recalled medications.
12. Nursing staff reviews the self-administered medication record for each nursing shift, and transfers pertinent information to the medication administration record (MAR) kept at the nursing station, appropriately noting that the doses were self-administered.

References

Storage of Medications

Policy Statement

The facility stores all drugs and biologicals in a safe, secure, and orderly manner.

Policy Interpretation and Implementation

1. Drugs and biologicals used in the facility are stored in locked compartments under proper temperature, light and humidity controls. Only persons authorized to prepare and administer medications have access to locked medications.
2. Drugs and biologicals are stored in the packaging, containers or other dispensing systems in which they are received. Only the issuing pharmacy is authorized to transfer medications between containers.
3. The nursing staff is responsible for maintaining medication storage and preparation areas in a clean, safe, and sanitary manner.
4. Drug containers that have missing, incomplete, improper, or incorrect labels are returned to the pharmacy for proper labeling before storing. Discontinued, outdated, or deteriorated drugs or biologicals are returned to the dispensing pharmacy or destroyed.
5. Hazardous drugs are clearly marked and stored separately from other medications.
6. Compartments (including, but not limited to, drawers, cabinets, rooms, refrigerators, carts, and boxes) containing drugs and biologicals are locked when not in use. Unlocked medication carts are not left unattended.
7. Medications requiring refrigeration are stored in a refrigerator located in the drug room at the nurses' station or other secured location. Medications are stored separately from food and are labeled accordingly.
8. Schedule II-V controlled medications are stored in separately locked, permanently affixed compartments. Access to controlled medication is separate from access to non-controlled medications.
 - a. Controlled medications that are part of a single unit dose distribution system may be stored with non-controlled medications when the supply is minimal and shortages are readily detectable.

Version	1.3 (H5MAPL0851)

Administering Medications by IV Push

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic administration of a medication bolus directly into the venous system through a vascular access device.

Preparation

1. A physician's order is necessary to administer medication via this route.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.
4. The licensed nurse responsible for IV medications shall be knowledgeable of:
 - a. indications for use;
 - b. appropriate routes of administration, doses and diluents;
 - c. side effects;
 - d. toxicities;
 - e. incompatibilities;
 - f. stability;
 - g. storage requirements;
 - h. potential complications; and
 - i. length of time needed to administer drug.

General Guidelines

1. Verify scope of practice and competency requirements for this procedure with state Nurse Practice Act.
2. Administer the first dose of intravenous medication in a situation in which close observation of the resident and the ability to intervene in the case of complications is possible.
3. Obtain anaphylaxis protocols/orders.
4. Follow manufacturer recommendations and pharmacy/facility guidelines for approved routes of medication administration for particular medications. *Some medications cannot be administered via IV push.*

Equipment and Supplies

1. Medication vial or ampule;
2. Medication labels for syringe;
3. Saline (preservative-free 0.9% sodium chloride) or heparin for flush per facility protocol;
4. Needleless connection device/adaptor, if needed;
5. Sterile syringe to withdraw medication;
6. Filter straw if withdrawing medicine from glass ampule;
7. Non-sterile gloves;
8. Alcohol wipes, tape; and
9. Mini-bag of flush solution, if needed.

continues on next page

Assessment

1. Inspect intravenous catheter site for signs of complications at scheduled intervals, upon routine site care and during administration set changes.
2. Prior to administration of intravenous medications assess resident's:
 - a. overall health status;
 - b. cardiovascular status;
 - c. history of allergies;
 - d. baseline vital signs, height and weight; and
 - e. laboratory/test results and appropriateness of therapy.
3. Review physician's order to confirm type of medication, amount, route, and rate of administration.
4. Verify the identity of the resident.
5. Inspect medication label and verify against the order.
6. Check vial for leaks, cracks, precipitate and expiration date.
7. Use a separate syringe for each medication. Give one medicine at a time, flushing with saline in between medications.

Steps in the Procedure

1. Perform hand antisepsis. Apply non-sterile gloves.
2. Withdraw medication from vial or glass ampule (use filter straw to withdraw medication from glass ampule).
 - a. Vials labeled as "single dose" or "single use" will not be used on multiple residents. Such vials will be used only for one resident in a single procedure.
3. Dilute medication with appropriate diluent (follow manufacturer guidelines or consult pharmacy).
 - a. When diluting or reconstituting medications, follow USP <797> guidelines for compounding sterile preparations.

To administer medication directly through an IV catheter:

1. Disinfect catheter port;
2. Attach saline-filled syringe and flush the catheter;
3. Disinfect catheter connection device again;
4. Attach medication-filled syringe and administer medication according to prescribed rate. If no rate is specified, administer over 1-2 minutes;

To calculate mL/minute
$\frac{\text{mL to be infused}}{\text{number of minutes}} = \text{mL/min}$
<p><i>Example: Order is for 25 mg of medication "A" to be administered over 5 minutes. Vial contains 25 mg/mL and must be diluted in 5 mL of sterile water. Total amount to be infused is 6 mL (1 mL of medication + 5 mL diluent).</i></p>
$\frac{6 \text{ mL}}{5 \text{ mins}} = 1.2 \text{ mL/min}$

5. Monitor time with second hand on watch (It is important to push at a controlled rate to avoid too high of a concentration of drug in a short period of time.);
6. Disinfect catheter connection device;

continues on next page

7. Flush catheter with appropriate flush (saline or dextrose) at the same rate that medication had been given to avoid giving a fast bolus dose;
8. Observe to make sure that medication has cleared the catheter;
9. Finish flushing catheter with saline, and heparin (if required);
10. Discard used supplies in appropriate receptacle; and
11. Perform hand antisepsis.

To administer through the side (Y) port of the administration set tubing:

1. Open IV clamp and allow primary solution to flow freely;
2. Disinfect the Y port;
3. Attach medication-filled syringe to Y port and administer medication per calculated rate. Stop intermittently to allow primary solution to flow;
4. After medication is administered, allow the IV solution to flush the tubing and catheter;
5. Return infusion to prescribed rate;
6. Discard used supplies in appropriate receptacle; and
7. Perform hand antisepsis.

Documentation

Document the following in the resident’s medical record:

1. Medication;
2. Dose;
3. Total amount infused;
4. Total time infused;
5. Condition of the catheter site; and
6. Resident response to the procedure, including any results of the medication (adverse or desired).

Reporting

Report to physician, supervisor and the oncoming shift any results, problems or complications (if any) that occurred during the medication administration.

Version	1.2 (H5MAPR0010)

Administering Medications via Secondary Tubing

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic administration of medications intravenously through a secondary (“piggy back”) line.

Preparation

1. A physician’s order is necessary to administer medication.
2. Check for medication allergies.
3. Assemble the equipment and supplies as needed.
4. The licensed nurse responsible for IV medications shall be knowledgeable of:
 - a. indications for use;
 - b. appropriate routes of administration, doses and diluents;
 - c. side effects;
 - d. toxicities;
 - e. incompatibilities;
 - f. stability;
 - g. storage requirements;
 - h. potential complications; and
 - i. allergies.

General Guidelines

1. First Dose of medication should be given in a situation in which close observation of the resident and the ability to intervene in the case of complications is possible.
2. Consult manufacturer’s recommendations regarding recommended monitoring and potential side effects of medication.
3. Obtain order for anaphylaxis protocol, or note if there is a standing protocol for intervention.
4. Observe resident during infusion and for a minimum of one hour after completion of the infusion.
5. Primary and secondary **continuous sets** are changed no more frequently than every 96 hours or upon suspected contamination.
6. Primary **intermittent sets** are changed every 24 hours.
7. If a secondary administration set is disconnected from a primary administration set, the secondary administration set is considered intermittent and is then changed every 24 hours.

Equipment and Supplies

1. Prescribed medication in IV bag, saline flush bag, or prescribed hydration fluid bag;
 - a. Medication may need to be reconstituted or mixed first. When diluting or reconstituting medications, follow USP <797> guidelines for compounding sterile preparations.
2. Primary and secondary tubing;
3. Needleless access device/adaptor;
4. Gloves;
5. Alcohol wipes; and

continues on next page

6. Tape (optional).

Assessment

1. Inspect insertion site and catheter for any signs or symptoms of IV-related complications before hanging solution. This should be done at least once a shift and during infusion procedure.
 - a. If any complications are noted, intervene as appropriate according to facility protocol.
2. Prior to administering IV solutions, assess the following:
 - a. general assessment of resident health status, and cardiac and respiratory status;
 - b. allergies;
 - c. baseline vital signs, weight, height (for pharmacy dosing needs); and
 - d. the physician's rationale for ordering treatment, laboratory results, and appropriateness of treatment.
3. Review physician's order and confirm the "5 Rights" of medication administration (right resident, medication name, dose, route, rate). If no rate is ordered, calculate rate according to dose, volume and time ordered.
4. Check medication bag for leaks, sterility, precipitate, and expiration date.
5. Ensure compatibility of secondary solution and primary solution.
6. If multiple medications are being placed on secondary tubing, check with pharmacy to determine if separate tubing is needed for each medication.

Steps in the Procedure

1. Perform hand antisepsis and don non-sterile gloves.
2. Connect secondary administration set to piggy back medication solution bag.
3. Prime primary tubing with ordered solution or normal saline. Prime secondary tubing with ordered medication. All air bubbles must be removed from tubing before attaching to resident.
4. Hang both IV bags on the IV pole.
 - a. **If infusing via gravity:** The secondary (smaller) bag is hung higher than the primary bag.
 - b. **If infusing via pump:** Both bags can be hung at the same level.
5. Disinfect Y injection/access port.
6. Attach secondary administration line to primary line at the Y port using needleless access device/adaptor.
7. Administer medication according to prescribed rate using pump or gravity flow-regulator tubing.
 - a. **If infusing via gravity:** Only the secondary solution should be infusing. The primary solution should start running after the secondary solution has been infused.
 - b. **If infusing via pump:** The primary and secondary solutions should be individually set for rate and volume. This prevents the bag from either running dry or infusing too much fluid.
8. After the secondary infusion is completed, the secondary tubing should be clamped.
 - a. **If infusing via gravity:** Primary bag needs to have the rate readjusted after secondary bag has been infused.
 - b. **If infusing via pump:** Primary bag will automatically change back to set rates. Monitor pump actions.
9. Leave secondary administration set in place until next medication is scheduled to be administered. If medication is given every 24 hours, the secondary bag should be disconnected and discarded in appropriate receptacle.
10. Discard used supplies in appropriate receptacles.
11. Perform hand antisepsis.

continues on next page

Documentation

1. Document the following in the resident's medical record.
 - a. Medication;
 - b. Dose;
 - c. Total amount infused;
 - d. Total time infused;
 - e. Condition of the catheter site; and
 - f. Resident response to the procedure, including any results of the medication (adverse or desired).

Reporting

1. Notify Physician (or supervisor per facility policy) and oncoming shift if medication was not infused or refused by resident.
2. Any complications with insertion site and interventions that were done.

Administering Medications through a Metered Dose Inhaler Level

III

Purpose

The purpose of this procedure is to provide guidelines for the safe administration of inhaled medications.

Preparation

1. Verify that there is a practitioner's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medication Administration Record;
2. Medication cart or tray;
3. Metered dose inhaler mouthpiece;
4. Prescribed medication canister;
5. Gargling solution; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash hands.
2. Arrange supplies in the medication room or move the medication cart outside the resident's room.
3. Place the MAR within easy viewing distance.
4. Unlock the medication cart.
5. Select the drug from the unit dose drawer or stock supply.
6. Check the label on the inhaler and confirm the medication name and dose with the MAR.
7. Check the expiration date on the inhaler. Return any expired medications to the pharmacy.
8. Confirm the identity of the resident.
9. Explain the procedure to the resident.
10. Place inhaler(s) on the bedside table or tray.
11. Assess the resident, if indicated:
 - a. Lung sounds;
 - b. Respiratory rate and depth;
 - c. Cough (amount, color, and character of expectorate);
 - d. Presence of dyspnea; and
 - e. Vital signs.
12. Determine if assessment data prohibits administration of medication.
13. Assist the resident to a sitting or side lying position.

continues on next page

14. Administer medication:
 - a. Shake the inhaler gently to mix the medication with aerosol propellant.
 - b. Remove cap from mouthpiece.
 - c. If the inhaler has a spacer, pull it away from the inhaler until it clicks into place.
 - d. Ask the resident to inhale and exhale deeply for a few breath cycles. On the last cycle, instruct the resident to exhale deeply.
 - e. Place the mouthpiece in the mouth and instruct resident to close his or her lips to form a seal around the mouthpiece.
 - f. Firmly depress the mouthpiece against the medication canister to administer medication.
 - g. Instruct the resident to inhale deeply and hold for several seconds.
 - h. Remove the mouthpiece from the mouth and instruct the resident to exhale slowly through pursed lips.
15. Repeat inhalation, if ordered. Allow at least one (1) minute between inhalations of the same medication and at least two (2) minutes between inhalations of different medications.
16. Rinse the mouthpiece with warm water to remove medication residue.
17. Discard all disposable items into designated containers.
18. Wash hands.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Administering Medications through a Small Volume (Handheld) Nebulizer

Level III

Purpose

The purpose of this procedure is to safely and aseptically administer aerosolized particles of medication into the resident's airway.

Preparation

1. Obtain a physician's order as needed.
2. Review the resident's care plan, current orders, and diagnoses to determine resident needs.
3. Check the treatment record.
4. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow the medication administration guidelines in the policy entitled *Administering Medications*.
2. If the resident suffers from Chronic Obstructive Pulmonary Disease (COPD), refer to the *Chronic Obstructive Pulmonary Disease (COPD), Clinical Protocol* in addition to this procedure.

Equipment and Supplies

1. Medication, as ordered;
2. Dropper or syringe (capacity to be determined by amount of medication);
3. Diluent, as ordered;
4. Nebulizer kit, including nebulizer, medication cup, T-piece, mouthpiece (or facemask), and tubing; and
5. Pressurized gas source (e.g., compressor).

Steps in the Procedure

1. Assemble equipment and supplies on the resident's overbed table.
2. Wash and dry hands.
3. Provide for the resident's privacy.
4. Explain the procedure to the resident.
5. Position the resident in semi-fowler's position.
6. Obtain baseline pulse, respiratory rate and lung sounds.
7. Wash and dry hands.
8. Draw up the medication to be nebulized.
9. Dispense medication into nebulizer cup.
10. Add the diluent, if ordered.
11. Assemble nebulizer equipment and attach to the source of gas per manufacturer's instructions.
12. After attaching the tubing to the source of gas, adjust the flow rate as ordered or per facility protocol.
13. Turn on the nebulizer and check the outflow port for visible mist.

continues on next page

14. Ask the resident to hold the mouthpiece gently between his/her lips (or apply face mask).
15. Instruct the resident to take a deep breath, pause briefly and then exhale normally.
16. Encourage the resident to repeat the above breathing pattern until the medication is completely nebulized, or until the designated time of treatment has been reached.
17. Remain with the resident for the treatment.
18. Approximately five minutes after treatment begins (or sooner if clinical judgment indicates) obtain the resident's pulse.
19. Monitor for medication side effects, including rapid pulse, restlessness and nervousness throughout the treatment.
20. Stop the treatment and notify the physician if the pulse increases 20 percent above baseline or if the resident complains of nausea or vomits.
21. Tap the nebulizer cup occasionally to ensure release of droplets from the sides of the cup.
22. Encourage the resident to cough and expectorate as needed.
23. Administer therapy until medication is gone.
24. When treatment is complete, turn off nebulizer and disconnect T-piece, mouthpiece and medication cup.
25. Wash and dry hands.
26. Obtain post-treatment pulse, respiratory rate and lung sounds.
27. Rinse and disinfect the nebulizer equipment according to facility protocol, or:
 - a. wash pieces with warm, soapy water;
 - b. rinse with hot water;
 - c. place all pieces in a bowl and cover with isopropyl (rubbing) alcohol. Soak for five minutes;
 - d. rinse all pieces with sterile water (NOT tap, bottled, or distilled); and
 - e. allow to air dry on a paper towel.
28. Wash and dry hands.
29. When equipment is completely dry, store in a plastic bag with the resident's name and the date on it.
30. Change equipment and tubing every seven days, or according to facility protocol.
31. Disinfect outside of the compressor between residents, according to manufacturer's instructions.

Documentation

The following information should be recorded in the resident's medical record.

1. The name, title and initials of the person administering the treatment.
2. The date, time and length of treatment (treatment administration record).
3. The type and amount of medication administered (medication administration record).
4. The type and source of gas.
5. Pulse, respiratory rate and lung sounds before and after the treatment.
6. Pulse during treatment.
7. Amount and characteristics of sputum production.
8. The resident's tolerance of the treatment.
9. Any adverse effects of the medication and/or treatment and physician notification, if applicable.

Reporting

1. Notify the Nurse Supervisor (or the physician) if the resident refuses the treatment.
2. Notify the Physician if nausea or vomiting occurs during treatment.

continues on next page

3. Notify the Physician if the resident experiences adverse effects from the medication.
4. Notify the Physician if the pulse rate during treatment increases 20 percent above baseline.
5. Follow any other orders for physician notification pertinent to the resident.

Administering Medications through an Enteral Tube

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe administration of medications through an enteral tube.

Preparation

1. Verify that there is a physician's medication order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

Follow the medication administration guidelines in the policy entitled *Administering Medications*.

1. Request liquid forms of medications from the pharmacy, if possible.
2. Do not add medication directly to the enteral feeding formula.
3. Administer each medication separately and flush between medications.
4. Do not crush or split medications for administration through an enteral tube unless first checking with the pharmacy or facility approved "Do Not Crush Medication List."
 - a. Tablets that must be crushed prior to administration through an enteral tube require a specific order related to crushing.
 - b. Do not crush enteric coated, sustained release, buccal, sub-lingual, or enzyme-specific medications.
 - c. Do not crush the contents of an opened capsule.
5. Do not administer oily medications through an enteral tube.
6. Use warm, purified water for diluting medications and for flushing.
7. Use a clean enteral syringe with an ENFit connector to administer medications through an enteral tube.
8. This procedure is contraindicated if the tube is obstructed or improperly positioned or if the resident is vomiting.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medication Administration Record;
2. Medication cart or tray;
3. Prescribed medication;
4. Disposable medication cups;
5. Purified warm water for diluting medications;
6. Purified warm water for flushing;
7. Towel or Chux® pad;
8. 60 mL enteral syringe (with transition adapter if necessary);
9. Clamp;
10. Pill-crushing device, as needed;

continues on next page

11. Gauze pads;
12. Stethoscope; and
13. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands.
2. Retrieve the medication:
 - a. Arrange supplies in the medication room or move the medication cart outside the resident's room.
 - b. Place the MAR within easy viewing distance.
 - c. Unlock the medication cart.
 - d. Select the drug from the unit dose drawer or stock supply.
 - e. Check the expiration date on the medication. Return any expired medications to the pharmacy.
3. Prepare the medication:
 - a. Check the label and confirm the medication name and dose with the MAR.
 - b. Confirm that the medication dosage form is compatible with enteral administration (check Do Not Crush Medication List and other pharmacy references).
 - c. Confirm that the medication and formulation are appropriate based on the distal end of the enteral tube (e.g., site of absorption).
 - d. Follow USP <795> (compounding non-sterile preparations) procedures for crushing, diluting and/or mixing prior to administration.
 - e. Calculate the medication dose. Re-check the calculation.
 - f. Place medications on the bedside table or tray.
4. Prepare the resident:
 - a. Confirm the identity of the resident.
 - b. Explain the procedure to the resident.
 - c. Assist the resident to semi-Fowler's position (30° to 45°), if tolerated by the resident's physical or medical condition.
 - d. Fold bed linens to the resident's waist and cover the chest with a towel or Chux® pad.
5. Check compatibility with feeding tube formula:
 - a. If the resident is on continuous tube feedings and the medication(s) are to be given on an empty stomach and/or are associated with medication-feeding formula incompatibility, stop the feeding at least 30 minutes prior to medication administration and restart at least 30 minutes after medication administration.
 - (1) Recommended timeframes between medication and enteral formula administration should be determined by the manufacturers of these products, or specified in the order.
 - (2) Consult the physician if there are any questions regarding compatibility, or if going this time period without feedings may compromise the resident.
6. Verify placement of feeding tube:
 - a. If you suspect improper tube positioning, do not administer feeding or medication. Notify the Charge Nurse or Physician.
7. Stop feeding and flush tubing with at least 15 mL warm purified water (or prescribed amount).
8. Remove the syringe and clamp tubing. Place the end of the tubing on a clean gauze pad positioned on the abdomen or chest of the resident.

continues on next page

9. Dilute medication:
 - a. Remove plunger from syringe. Add medication and appropriate amount of water to dilute.
 - b. Dilute crushed (powdered) medication with at least 30 mL purified water (or prescribed amount).
 - c. Dilute liquid medication with 30 mL or more (depending on viscosity) purified water.
10. Administer each medication separately.
11. Reattach syringe (without plunger) to the end of the tubing.
12. Administer medication by gravity flow:
 - a. Pour diluted medication into the barrel of the syringe while holding the tubing slightly above the level of insertion.
 - b. Open the clamp and deliver medication slowly.
 - c. Begin flush before the tubing drains completely.
13. If administering more than one medication, flush with 15 mL warm purified water (or prescribed amount) between medications.
14. When the last of the medication begins to drain from the tubing, flush the tubing with 15 mL of warm purified water (or prescribed amount).
15. Quickly clamp the tubing when the flush is complete. Remove syringe.
16. Cap the tube and fasten to the resident's gown, or reconnect to feeding formula if appropriate.
17. Remove towel or Chux® pad and reposition the bed covers.
18. Have the resident maintain the semi-Fowler's position for at least 30 minutes, if tolerated by the resident's physical or medical condition. Alternatively, place resident on right side with the head of the bed partially elevated.
19. Discard all disposable items into designated containers.
20. Wash your hands.
21. Place the call light within easy reach of the resident.
22. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the policy entitled *Documentation of Medication Administration*.

Administering Oral Medications

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe administration of oral medications.

Preparation

1. Verify that there is a physician's medication order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medication Administration Record;
2. Medication cart or tray;
3. Disposable medication cups;
4. Disposable drinking cups;
5. Water pitcher;
6. Drinking straws;
7. Pill-crushing device, if needed; and
8. Pill-cutting device, if needed.

Steps in the Procedure

1. Wash your hands.
2. Arrange supplies in the medication room or move the medication cart outside the resident's room.
3. Place the MAR within easy viewing distance.
4. Unlock the medication cart.
5. Select the drug from the unit dose drawer or stock supply.
6. Check the label on the medication and confirm the medication name and dose with the MAR.
7. Check the expiration date on the medication. Return any expired medications to the pharmacy.
8. Check the medication dose. Re-check to confirm the proper dose.
9. Prepare the correct dose of medication:
 - a. For **liquid medications**. Remove the cap from the bottle and place cap upside down on the work surface. Hold the medication cup at eye level and use your thumb to mark the desired level on the cup. Fill to the bottom of the meniscus at the desired level. Place cup on a level surface and read the poured amount at eye level to check accuracy.
 - b. For **narcotics**. Check the narcotic record for the previous drug count and compare with the supply on hand. Report any discrepancies to the nurse supervisor.
 - c. For **powdered medications**. Mix with liquids at the bedside.

continues on next page

- d. **For effervescent medications.** Dissolve immediately before administration.
 - e. For **tablets or capsules from a bottle.** Pour the desired number into the bottle cap and transfer to the medication cup. Do not touch the medication with your hands. Return extra capsules/tablets to the bottle. All medications to be given at the same time can be placed in the same cup except those that require assessment (e.g., vital signs) prior to administration.
 - f. For **unit dose tablets or capsules.** Place packaged medications directly into the medication cup.
10. Confirm the identity of the resident.
 11. Explain the procedure to the resident.
 12. Place medications on the bedside table or tray.
 13. Perform any pre-administration assessments.
 14. Assist the resident to a sitting or side lying position.
 15. Offer water to assist the resident in swallowing medications.
 16. Allow the resident to swallow **oral tablets or capsules** at his or her comfortable pace.
 17. If the resident cannot hold his or her own medications, place the cup near the lips and gently introduce each medicine one at a time, followed by a sip of water. Do not rush the resident.
 18. Instruct the resident to place **sublingual medications** under the tongue and allow the drug to dissolve.
 19. Instruct the resident to place **buccal medications** against either cheek and allow the drug to dissolve.
 20. If a medication falls to the floor, discard and document per facility protocol. Repeat the preparation.
 21. Remain with the resident until all medications have been taken.
 22. Discard all disposable items into designated containers.
 23. Perform hand antisepsis.
 24. Reposition the bed covers. Make the resident comfortable.
 25. Place the call light within easy reach of the resident.
 26. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Administering Rectal or Vaginal Medications

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe administration of rectal and vaginal medications.

Preparation

1. Verify that there is a physician's medication order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medication Administration Record;
2. Medication cart or tray;
3. Suppositories (rectal or vaginal);
4. Cream, gel, or ointment (vaginal);
5. Lubricant;
6. Applicator, as indicated; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Perform hand antisepsis.
2. Arrange supplies in the medication room or move the medication cart outside the resident's room.
3. Place the MAR within easy viewing distance.
4. Unlock the medication cart.
5. Select the drug from the unit dose drawer or stock supply.
6. Check the label on the medication and confirm the medication name and dose with the MAR.
7. Check the expiration date on the medication. Return any expired medications to the pharmacy.
8. Check the medication dose. Re-check the dose.
9. Prepare the correct dose of medication.
10. Confirm identity of the resident.
11. Explain the procedure to the resident.
12. Place medications on the bedside table or tray.
13. Provide for privacy of the resident.
14. Insert medication:

continues on next page

Rectal Suppositories

- a. Assist the resident to a lateral position with the leg flexed at the hip and knee, if possible.
- b. Fold bed sheets back so that only the buttocks are exposed.
- c. Unwrap the suppository and place it on the open wrapper.
- d. Put on clean gloves.
- e. Lubricate the insertion point of the suppository. (**Note:** The smooth, rounded tip of the suppository is the insertion point.)
- f. Lubricate gloved index finger.
- g. Gently insert the suppository into the anus with the lubricated, gloved index finger. Insert approximately 10 cm (4 inches) deep along the wall of the rectum.
- h. Instruct resident to remain in a left lateral or lying position for at least five (5) minutes.
- i. Remove gloves and turn inside out to contain rectal bacteria. Wash and dry hands thoroughly.

Vaginal Suppositories

- a. Ask the resident to void.
- b. Help her to a lithotomy position.
- c. Expose the perineum.
- d. Remove suppository from the wrapper and lubricate the tip.
- e. Put on gloves.
- f. With applicator or gloved index finger, insert the medication approximately 5 cm (2 inches). When the suppository reaches the distal wall of the vagina, depress the applicator plunger.
- g. Remove the applicator with plunger still depressed.
- h. Remove gloves. Wash and dry hands thoroughly.

Vaginal Creams, Ointments, Gels

- a. Insert plunger into applicator.
 - b. Attach the applicator to the medication tube.
 - c. Squeeze the tube to inject prescribed amount of medication into the applicator.
 - d. Detach from tube and lubricate applicator end.
 - e. Put on gloves.
 - f. Assist resident to lithotomy position and expose the perineum.
 - g. Insert the applicator approximately 5 cm (2 inches) into the vagina or until applicator touches the distal wall of the vagina.
 - h. Administer the medication by depressing the plunger. Remove applicator from the vagina with the plunger still depressed.
 - i. Remove gloves. Wash and dry hands thoroughly.
15. Discard all disposable items into designated containers.
 16. Perform hand antisepsis.
 17. Reposition the bed covers. Make the resident comfortable.
 18. Place the call light within easy reach of the resident.
 19. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

continues on next page

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Administering Topical Medications

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe administration of topical medications.

Preparation

1. Verify that there is a physician's medication order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medication Administration Record;
2. Medication cart or tray;
3. Solution or solvent for cleaning, as indicated;
4. Gauze for cleaning, as indicated;
5. Dressing, as indicated or ordered;
6. Applicator tube, as needed;
7. Tongue blade; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Perform hand antisepsis by either washing with soap and water or applying alcohol-based hand rub.
2. Arrange supplies in the medication room or move the medication cart outside the resident's room.
3. Place the MAR within easy viewing distance.
4. Unlock the medication cart.
5. Select the drug from the unit dose drawer or stock supply.
6. Check the label on the medication and confirm the medication name and dose with the MAR.
7. Check the expiration date on the medication. Return any expired medications to the pharmacy.
8. Calculate the medication dose. Re-check the calculation.
9. Prepare the correct dose of medication.
10. Confirm identity of the resident.
11. Explain the procedure to the resident.
12. Place medications on the bedside table or tray.
13. Apply glove to your dominant hand. If exposure to blood or body fluids is likely, glove both hands.
14. Position the resident comfortably while providing exposure to the area to be treated.
15. Assess the area for broken skin, drainage, debris, rashes, allergic reaction, or signs of infection.
16. Remove excessive hair, if indicated.

continues on next page

17. Clean the skin. Remove old medication residue, debris, scales, dried blood, etc. If necessary, saturate a gauze pad with solvent and wipe in the direction of hair growth to remove paste, cream or ointment from the area.
18. Don clean gloves, if necessary.

Apply medication:

1. Paste, cream, ointment, or lotion

- a. Open the container and place the tube upside down on the table surface.
- b. Apply clean gloves.
- c. Remove tongue blade from sterile wrapper.
- d. Place medication on the tongue blade and transfer to gloved hands.
- e. Warm the medication in gloved hands and apply gently to the skin in the direction of hair growth.
- f. Repeat as necessary to cover the entire area, using a new tongue blade for each application.
- g. Remove gloves. Wash and dry hands thoroughly.

2. Powder

- a. Clean and dry the skin surface.
- b. Sprinkle the site with a fine, thin layer of powder, spreading any folds of skin, as necessary.
- c. Remove gloves. Wash and dry hands thoroughly.

3. Suspension-based lotion

- a. Shake the container well to distribute all suspended particles in the solution.
- b. Apply lotion to a sterile gauze pad.
- c. Apply lotion in the direction of hair growth.
- d. Repeat with new gauze pad until entire area is covered.
- e. Remove gloves. Wash and dry hands thoroughly.

4. Aerosol spray

- a. Shake the container.
- b. Hold at recommended distance from affected area (typically 6 to 12 inches).
- c. Cover the resident's face with a towel if spraying the head or neck.
- d. Apply spray evenly to affected area.
- e. Remove gloves. Wash and dry hands thoroughly.

5. Trans-dermal patches

- a. Clean and dry a selected area that is approved for application of the patch. Rotate sites with each new application, if possible.
- b. Remove old patch.
- c. Remove wrapper from the patch. Do not touch the adhesive surface.
- d. Apply to the skin, pressing firmly for approximately ten (10) seconds.
- e. Remove gloves. Wash and dry hands thoroughly.

6. Don gloves and apply sterile dressing, as necessary.

7. Discard all disposable items into designated containers.

8. Perform hand antisepsis.

9. Reposition the bed covers. Make the resident comfortable.

10. Place the call light within easy reach of the resident.

11. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

continues on next page

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Application of Eye Ointment

Level III

Purpose

The purpose of this procedure is to provide guidelines for the instillation of eye ointment to treat eye infections and to soothe or lubricate the eye.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Allow the resident as much privacy as possible.
2. Should both eyes require ointment, wash and dry your hands thoroughly before treating each eye.
3. To steady the ointment tube during the application process, rest your hand on the bridge of the resident's nose or on his/her forehead.
4. When administering two or more different eye ointments allow five minutes between each application.
5. Do not force the procedure. Take your time and be gentle with the resident.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Ointment (as prescribed);
2. Gauze pads;
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed); and
4. Other as may be necessary or appropriate.

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. If the resident is sitting up, tilt his/her head backward slightly.
5. If the resident is bedfast, position the resident's head on the pillow and tilt the head backward slightly.
6. Gently pull the lower eyelid down. Instruct the resident to look up.
7. Apply a thin line of ointment along the surface of the retracted lower lid. (**Note:** Do not let the tip of the ointment tube touch the eye or eyelid.)
8. Instruct the resident to close his/her eyelid and rotate his/her eyeball to allow for even distribution of the ointment. Instruct the resident not to blink or squeeze the eyelids shut, as this will force the medication out of the eye.
9. Wipe off the tip of the ointment tube with a clean gauze pad and replace cap.
10. Gently wipe off excess ointment in the eye area with a clean gauze pad.
11. Discard used gauze pads into designated container.

continues on next page

12. If the resident complains of pain, cease the procedure and summon the nurse supervisor.
13. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
14. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
15. Discard disposable equipment and supplies in designated containers.
16. Clean the overbed table and return it to its proper position.
17. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
18. Reposition the bed covers. Make the resident comfortable.
19. Place the call light within easy reach of the resident.
20. Wash and dry your hands thoroughly.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the eye ointment was administered.
2. The name and title of the individual(s) who administered the eye ointment.
3. The type of ointment administered.
4. All assessment data obtained concerning the resident's eye.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Instillation of Ear Drops

Level III

Purpose

The purposes of this procedure are to treat ear infections, to administer medications into the auditory canal, and to soften wax deposits.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Medicine dropper;
2. Cotton balls;
3. Solution (as prescribed);
4. Bowl (one-half full of warm water);
5. Cotton applicators; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Place the ear solution bottle into the bowl of warm water. Allow the solution to warm. **DO NOT** administer a cold solution in the ear unless ordered by the physician.
5. If the resident is sitting up, instruct the resident to tilt his/her head with the affected side up.
6. If the resident is bedfast, position the resident's head on the pillow so that the affected side is facing up.
7. Gently cleanse the external auditory canal with cotton applicators.
8. Draw medication into the dropper. Test it on the wrist to be sure it is warm.
9. Gently drop the medication into the ear. (**Note:** Do not let the tip of the ear dropper touch the ear or any other surface.) Replace the cap and keep the bottle tightly closed.
10. Grasp the auricle (flap of the ear) to straighten the canal and allow the medication to enter the ear.
11. If the resident complains of pain, cease the procedure and summon the nurse supervisor.
12. Place a small amount of cotton into the external auditory canal. (**Note:** This is to catch any medication that may run out. However, do not block the ear canal. Keep cotton in the lower part of the ear.)
13. Instruct the resident to remain in this position for 10-15 minutes.
14. Gently dry the ear with cotton balls if dripping occurs. (**Note:** Use only one cotton ball per wipe.)
15. Discard used cotton balls into designated container.
16. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
17. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).

continues on next page

18. Discard disposable equipment and supplies in designated containers.
19. Clean the overbed table and return it to its proper position.
20. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. Wash and dry your hands thoroughly.
24. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the ear drops were instilled.
2. The name and title of the individual(s) who instilled the ear drops.
3. The type of solution instilled in the ear.
4. All assessment data obtained concerning the resident's ear.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Instillation of Eye Drops

Level III

Purpose

The purpose of this procedure is to provide guidelines for instillation of eye drops to treat medical conditions, eye infections and dry eyes.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Allow the resident as much privacy as possible.
2. Should both eyes require instillation, wash and dry your hands thoroughly before treating each eye.
3. To steady the eye dropper during the instillation process, rest your hand on the bridge of the resident's nose or on his/her forehead.
4. When administering two or more different eye drops allow three to five minutes between each application.
5. Do not force the procedure. Take your time and be gentle with the resident.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Eye dropper;
2. Cotton balls;
3. Solution (as prescribed);
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed); and
5. Other as may be necessary or appropriate.

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. If the resident is sitting up, tilt his/her head backward slightly.
5. If the resident is bedfast, position the resident's head on the pillow and tilt the head backward slightly.
6. Draw medication into the dropper.
7. Gently pull the lower eyelid down. Instruct the resident to look up.
8. Drop the medication into the mid lower eyelid (fornix). (**Note:** Do not touch the eye or eyelid with the dropper.) Recap the medication bottle.
9. Instruct the resident to slowly close his/her eyelid to allow for even distribution of the drops. Instruct the resident not to blink or squeeze the eyelids shut, which forces the medicine out of the eye.
10. Gently dry the eyelid with cotton ball if dripping occurs. (**Note:** Use only one cotton ball per wipe.)

continues on next page

11. Discard used cotton balls into designated container.
12. If the resident complains of pain, cease the procedure and summon the nurse supervisor.
13. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
14. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
15. Discard disposable equipment and supplies in designated containers.
16. Clean the overbed table and return it to its proper position.
17. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
18. Reposition the bed covers. Make the resident comfortable.
19. Place the call light within easy reach of the resident.
20. Wash and dry your hands thoroughly.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the eye drops were instilled.
2. The name and title of the individual(s) who instilled the eye drops.
3. The type of solution instilled in the eye.
4. All assessment data obtained concerning the resident's eye.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Intradermal Injections

Level III

Purpose

The purpose of this procedure is to provide guidelines for the administration of medication by intradermal injection.

Preparation

1. Verify that there is a physician's medication order for this procedure. Verify the order for resident's name, drug name, dose, time, and route of administration.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. 1mL tuberculin syringe with preattached 26 or 27 gauge needle;
2. Alcohol swabs;
3. Prescribed medication;
4. Medication administration record;
5. Sharps container; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Perform hand antisepsis.
2. Put on gloves.
3. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
4. Assist resident to a comfortable position with the elbow and forearm extended and supported on a flat surface.
5. Select appropriate injection site approximately 3 to 4 finger-widths below the antecubital space and a hand-width above the wrist.
6. Clean the site with an alcohol swab using a circular motion from the proposed site of injection outward.
7. Remove needle cap by pulling it straight off.
8. Hold syringe between thumb and forefinger of dominant hand with bevel of needle pointing up. With nondominant hand, stretch skin over site with forefinger or thumb.
9. Insert the needle into the resident's skin at a 5° to 15° angle. Advance the needle through the epidermis approximately one-eighth (1/8) of an inch below the skin's surface. The needle tip can be seen through the skin.
10. Inject medication slowly. You should see a small bubble appear as the medication is injected.

continues on next page

11. Withdraw needle while applying alcohol swab gently over the site. Do not massage the site.
12. Discard uncapped needle and syringe into designated sharps container.
13. Discard all disposable items into designated containers.
14. Remove gloves and discard in designated container. Perform hand antisepsis.
15. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
16. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Intramuscular Injections

Level III

Purpose

The purpose of this procedure is to provide guidelines for the administration of medication by intramuscular injection.

Preparation

1. Verify that there is a physician's medication order for this procedure. Verify the order for resident's name, drug name, dose, time, and route of administration.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow the medication administration guidelines in the policy entitled *Administering Medications*.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. 3mL syringe;
2. Needle (19 to 23 gauge, 1 to 1½ inch);
3. Alcohol swabs;
4. Prescribed medication;
5. Medication administration record;
6. Sharps container; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Perform hand antisepsis.
2. Put on gloves.
3. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
4. Select appropriate injection site.
5. Assist resident to a comfortable position depending on the site chosen for the injection.
 - a. Vastus Lateralis – The resident lies flat, supine with knee slightly flexed.
 - b. Ventrogluteal – The resident lies on back or side, flexes knee and hip on side to be injected.
 - c. Dorsogluteal – The resident lies prone with feet turned inward or lies on side with upper knee and hip flexed and placed in front of lower leg.
 - d. Deltoid – The resident may sit or lie flat with lower arm flexed but relaxed across abdomen or hip.
6. Clean the site with an alcohol swab using a circular motion from the proposed site of injection outward.
7. Remove needle cap by pulling it straight off.
8. Hold syringe between thumb and forefinger of dominant hand as if grasping a dart. Hold it with palm down at a 90° angle.

continues on next page

9. Position nondominant hand at appropriate anatomic landmark and spread skin tightly.
10. Inject needle quickly and firmly at 90° angle into muscle.
11. After needle enters the site, grasp the lower end of the syringe barrel with nondominant hand. Move dominant hand to end of plunger. Avoid moving the syringe.
12. Slowly inject medication.
13. Withdraw needle quickly while placing alcohol swab gently above or over site.
14. Massage site lightly.
15. Discard uncapped needle and syringe into designated sharps container.
16. Discard all disposable items into designated containers.
17. Remove gloves and discard in designated container. Perform hand antisepsis.
18. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
19. Wash and dry your hands thoroughly.
20. Reposition the bed covers. Make the resident comfortable.
21. Place the call light within easy reach of the resident.
22. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Subcutaneous Injections

Level III

Purpose

The purpose of this procedure is to provide guidelines for the administration of medication by subcutaneous injection.

Preparation

1. Verify that there is a physician's medication order for this procedure. Verify the order for resident's name, drug name, dose, time, and route of administration.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow the medication administration guidelines in the policy entitled Administering Medications.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. 3mL syringe;
2. Needle (27 to 25 gauge, 3/8 to 5/8 inch);
3. Alcohol swabs;
4. Prescribed medication;
5. Medication administration record;
6. Sharps container; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Perform hand antisepsis.
2. Put on gloves.
3. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
4. Select appropriate injection site.
5. Assist resident to a comfortable position and ask him/her to relax arm, leg, or abdomen depending on the site chosen for the injection.
6. Clean the site with an alcohol swab using a circular motion from the proposed site of injection outward.
7. Remove needle cap by pulling it straight off.
8. Hold syringe between thumb and forefinger of dominant hand as if grasping a dart.
9. Spread skin tightly across injection site or pinch skin with nondominant hand.
10. Inject needle quickly and firmly at 45° to 90° angle.
11. After needle enters the site, grasp the lower end of the syringe barrel with nondominant hand. Move dominant hand to end of plunger. Avoid moving the syringe.

continues on next page

12. Slowly inject medication.
13. Withdraw needle quickly while placing alcohol swab gently above or over site.
14. Massage site lightly. (**Note:** Do not massage site after injecting subcutaneous heparin.)
15. Discard uncapped needle and syringe into designated sharps container.
16. Discard all disposable items into designated containers.
17. Remove gloves and discard in designated container. Perform hand antisepsis.
18. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
19. Wash and dry your hands thoroughly.
20. Reposition the bed covers. Make the resident comfortable.
21. Place the call light within easy reach of the resident.
22. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Follow documentation guidelines in the procedure entitled *Documentation of Medication Administration*.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Medication and Treatment Orders

Policy Statement

Orders for medications and treatments will be consistent with principles of safe and effective order writing.

Policy Interpretation and Implementation

1. Medications shall be administered only upon the written order of a person duly licensed and authorized to prescribe such medications in this state.
2. Only authorized, licensed practitioners, or individuals authorized to take verbal orders from practitioners, shall be allowed to write orders in the medical record.
3. Drug and biological orders must be recorded on the physician's order sheet in the resident's chart. Such orders are reviewed by the consultant pharmacist on a monthly basis.
4. All drug and biological orders shall be written, dated, and signed by the person lawfully authorized to give such an order.
5. The signing of orders shall be by signature or a personal computer key. Signature stamps may not be used.
6. The staff and practitioner shall use only approved abbreviations and symbols when ordering and/or charting medications.
7. Verbal orders must be recorded immediately in the resident's chart by the person receiving the order and must include prescriber's last name, credentials, the date and the time of the order.
8. Verbal orders must be signed by the prescriber at his or her next visit.
9. Orders for medications must include:
 - a. name and strength of the drug;
 - b. number of doses, start and stop date, and/or specific duration of therapy;
 - c. dosage and frequency of administration;
 - d. route of administration;
 - e. clinical condition or symptoms for which the medication is prescribed; and
 - f. any interim follow-up requirements (pending culture and sensitivity reports, repeat labs, therapeutic medication monitoring, etc.).
10. Only authorized personnel shall call in orders for prescribed medications to the pharmacy.
11. Drugs and biologicals that are required to be refilled must be reordered from the issuing pharmacy not less than three (3) days prior to the last dosage being administered to ensure that refills are readily available.
12. Orders not specifying the number of doses, or duration of medication, shall be subject to automatic stop orders.
 - a. Drugs not specifically limited to duration of use and number of doses when ordered will be controlled by automatic stop orders.
 - b. One (1) day prior to the date the stop order is to become effective, the nurse supervisor/charge nurse on duty must contact the prescriber or attending physician to determine if the medication is to be continued.

continues on next page

13. Orders for withholding food prior to a test or treatment (“NPO”) shall be made by the attending physician as necessary.
 - a. Nursing will use a diet change notification form to inform the food services staff when it is necessary to hold the resident’s food tray, and when the tray delivery can resume.
 - b. Nursing staff will review the overall situation for a resident for whom one or more meals is to be held to ensure that any related issues are addressed (e.g., adjustment of insulin doses, maintenance of adequate hydration).

14. Orders for anti-coagulants will be prescribed only with appropriate clinical and laboratory monitoring.
 - a. The attending physician must periodically record in the progress notes the results of the laboratory monitoring and the review for potential complications.

Medication and Treatment Orders, Dental Services

Policy Statement

Orders for the treatment of the resident's dental problems must be signed by the attending dentist.

Policy Interpretation and Implementation

1. All orders for the treatment of the resident's dental problems must be in writing and signed and dated by the dentist providing the service.
2. Medication orders and treatment will be administered by nursing service personnel as soon as the order has been received.
3. All orders must be charted and made a part of the resident's medical record and care plan.
4. The resident's attending physician must be informed of the treatment and medications ordered by the dentist.
5. Any conflict in treatment or medication must be brought to the attention of the dentist, attending physician, and the director of nursing services prior to the performance or administration of such treatment or medication.

Version	1.1 (H5MAPL0514)

Telephone Orders

Policy Statement

Verbal telephone orders may be accepted from each resident’s attending physician.

Policy Interpretation and Implementation

1. Verbal telephone orders may only be received by licensed personnel (e.g., RN, LPN/LVN, pharmacist, physician, etc.). Orders must be reduced to writing, by the person receiving the order, and recorded in the resident’s medical record.
2. The entry must contain the instructions from the physician, date, time, and the signature and title of the person transcribing the information.
3. Telephone orders must be countersigned by the physician during his or her next visit.
4. Unless otherwise prohibited by law, verbal telephone orders for schedule II drugs will be permitted in accordance with facility policy.

Verbal Orders

Policy Statement

1. Verbal orders shall only be given in an emergency or when the attending physician is not immediately available to write or sign the order.
2. Verbal orders will always be based on verbal exchange with the prescribing practitioner or on approved written protocols.

Policy Interpretation and Implementation

1. Only authorized, licensed practitioners, or individuals authorized to take verbal orders from practitioners, shall be allowed to write orders in the medical record.
2. Verbal orders are those given by an authorized practitioner directly to a person authorized to receive and transcribe orders on his or her behalf. A telephone order is a verbal order given over the telephone.
3. Text messaging is not an acceptable method of communicating an order.
4. The individual receiving the verbal order must write it on the physician's order sheet as "v.o." (verbal order) or "t.o." (telephone order).
5. The individual receiving the verbal order will:
 - a. read the order back to the practitioner to ensure that the information is clearly understood and correctly transcribed;
 - b. record the ordering practitioner's last name and his or her credentials (MD, NP, PA, etc.); and
 - c. record the date and time of the order.
6. The practitioner will review and countersign verbal orders during his or her next visit.
7. If a treatment, test, or another intervention is included in a written protocol that has been reviewed and approved by the medical director, then a verbal order may be written for a situation that is covered by the protocol. Otherwise a verbal order will not be written that is not based on a conversation with the practitioner.
8. Anyone writing an unauthorized verbal order will be subject to disciplinary action.

Medication Orders

Level III

Purpose

The purpose of this procedure is to establish uniform guidelines in the receiving and recording of medication orders.

Supervision by a Physician

1. Each resident must be under the care of a Licensed Physician authorized to practice medicine in this state and must be seen by the Physician at least every sixty (60) days.
2. A current list of orders must be maintained in the clinical record of each resident.
3. Orders must be written and maintained in chronological order.
4. Physician Orders/Progress Notes must be signed and dated every thirty (30) days. (Note: This may be changed to every sixty (60) days after the first ninety (90) days of the resident's admission, provided it is approved by the Attending Physician and the Utilization Review Committee.)

Recording Orders

1. **Medication Orders** – When recording orders for medication, specify the type, route, dosage, frequency and strength of the medication ordered. A placebo is considered a medication and must also have specific orders.

Example: *Dilantin 100mg by mouth three times per day.*

2. **PRN Medication Orders** – When recording PRN medication orders, specify the type, route, dosage, frequency, strength and the reason for administration.

Example: *Tylenol 500mg by mouth every 4 hours as needed for mild pain or temp greater than 101°F.*

3. **Oxygen Orders** – When recording orders for oxygen, specify the rate of flow, route and rationale.

Example: *oxygen 3L/min per nasal cannula as needed for shortness of breath.*

4. **Enteral Orders** – When recording orders for enteral tube feedings, specify the type of feeding, amount, frequency of feeding and rationale if prn. The order should always specify the amount of flush following the feeding.

Example: *Isocal 250cc followed by H₂O 50 cc every 4hours via NG tube.*

5. **Intravenous Orders** – When recording orders for IV solutions, specify the type of solution, rate of flow and volume to be infused.

Example: *1000cc D5W IV @50cc/hr. Discontinue when infused.*

6. **Treatment Orders** – When recording treatment orders, specify the treatment, frequency and duration of the treatment.

Example: *Apply 4X4" duoderm with border to stage 1 ulcer on coccyx; change every 3 days and as needed per wound care protocol.*

continues on next page

7. **Commercial Dietary Supplements** – When recording orders for commercial dietary supplements, specify the type, amount and frequency.

Example: *Ensure 3 ounces three times per day, between meals.*

CMS-20070 Dental Status and Services

Sample Documentation

Activities Evaluation (MP5450)
Resident Care Flow Record (MP4111)

Sensory Impairments – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the staff and physician will help identify individuals with sensory impairments, including hearing, taste, vision, smell, and touch.
2. The staff and physician will identify risk factors for sensory deficits or complications of sensory deficits; for example, a history of glaucoma or early cataracts, peripheral neuropathies, diabetic retinopathy, chronic sinusitis or other conditions that affect smell or taste, and medications that affect taste or have potential ototoxicity (for example, aminoglycoside antibiotics).

Cause Identification

1. The physician will help the staff identify causes of sensory impairments, especially potentially correctable ones such as medication side effects or previously unrecognized or unmanaged medical conditions.
2. The physician will order appropriate consultations (for example, ophthalmology or podiatry evaluations) to help define causes and complications of sensory impairments.

Treatment/Management

1. The physician will address treatable underlying causes of sensory impairments; for example, correct nutritional deficiencies (such as vitamin B12 or mineral deficiency) affecting sensation or taste, treat glaucoma, and reduce, stop, or change medications with side effects that significantly alter taste or impair hearing.
2. The staff will try to minimize complications of sensory impairments; for example, optimize lighting in the resident's room and the hallway, refer for corrective lenses, assist with foot care, limit the temperature of hot liquids served, and season food adequately.
3. The staff and physician will identify approaches to help the resident improve or compensate for sensory deficits.
 - a. For example, they may refer visually impaired individuals for a vision evaluation and/or corrective lenses.
 - b. For a resident with impaired hearing, the staff should check for cerumen, and may (as indicated) help the individual obtain a hearing evaluation, hearing aid, or employ written or other means to communicate with the individual.
4. The physician will identify and order appropriate consultations to help manage the causes, complications, and risks of sensory impairment.

Monitoring

1. The staff and physician will monitor the function and symptoms of individuals with sensory impairments, and the status of any underlying causes and complications.
2. The physician and staff will adjust interventions based on the results of these interventions and on subsequent changes in the resident's condition, prognosis, and function.

Sleep Disorders – Clinical Protocol

Assessment and Recognition

1. The physician and staff will identify individuals with sleep disturbances and those at risk.
2. Nursing staff (especially night shift staff) will describe any sleep disturbance in detail; for example, patterns over time, associated behavior, daytime sleepiness and factors that appear to improve or worsen the situation.
 - a. Early bedtime (e.g., between 7 p.m. and 10 p.m. may lead to early awakening after getting adequate sleep.
 - b. While communication with a physician may be necessary to discuss the status of an acute medical illness that is also disrupting an individual's sleep, it is generally unnecessary to request sleep medication overnight for uncomplicated night time wakefulness. Instead, report concerns to the day staff and request that the provider help clarify the nature and severity of any sleep disturbance.

Cause Identification

1. The staff will consider various causes of sleep disturbance such as noise level, room temperature, lighting levels, bed comfort, roommate distractions, and staff intrusion.
2. The physician will help identify medical causes of sleep disturbance by reviewing the resident's history, discussing the situation with the resident and staff, and examining the resident directly, as indicated.
 - a. This evaluation should include a review of any conditions that can affect sleep; for example, congestive heart failure that is causing orthopnea (dyspnea related to lying down) or nocturia (increased nighttime urination), COPD or esophageal reflux that is causing nocturnal dyspnea or cough, pain that awakens an individual, medications that cause daytime drowsiness or affect sleep, sleep disorders such as periodic limb movement in sleep (PLMS) or sleep apnea, etc.
 - b. Based on the assessment, the physician may order diagnostic studies to rule out specific causes such as sleep apnea.
3. The physician and staff will try to minimize sleep disruptions, for example, by minimizing orders to check vital signs or administer treatments during sleeping hours.

Treatment/Management

1. Staff will institute general measures to address sleep issues, for example, by identifying individuals to encourage out of bed when unsuccessful at falling asleep and by suggesting that the resident limit time spent in bed during the day.
2. The physician will order appropriate interventions to address sleep disturbances.
 - a. If sleep medications are indicated, they should be prescribed judiciously, in the lowest possible doses for the shortest possible time. Intermittent or short-term use is preferable to continuous nightly use.
 - b. Other strategies to reduce the use of sleep medications should be considered. For example, non-sleep medications that tend to cause drowsiness can be administered closer to bedtime and medications that may cause symptoms such as nocturia that interfere with sleep can be given earlier in the day. In addition, evaluating caffeine intake and overall activity level of the resident may present opportunities for adjustments in lifestyle that may improve the quality of sleep.

continues on next page

Monitoring

1. The physician and staff will monitor the resident’s progress toward improving sleep, and adjust interventions accordingly.
2. If sleep medications have been initiated, the physician will periodically attempt to reduce the doses and/or frequency of administration; for example, by switching a short-term standing order to PRN and observing how often the medication is used, or substituting a shorter-acting or less potent medication.
 - a. The physician will document if such reduction is not indicated or not tolerated; for example, a cognitively intact individual has developed a dependency prior to coming to the facility and cannot sleep without taking medication.

Activities of Daily Living (ADL), Supporting

Policy Statement

Residents will be provided with care, treatment and services as appropriate to maintain or improve their ability to carry out activities of daily living (ADLs).

Residents who are unable to carry out activities of daily living independently will receive the services necessary to maintain good nutrition, grooming and personal and oral hygiene.

Policy Interpretation and Implementation

1. Residents will be provided with care, treatment and services to ensure that their activities of daily living (ADLs) do not diminish unless the circumstances of their clinical condition(s) demonstrate that diminishing ADLs are unavoidable.
 - a. The existence of a clinical diagnosis or condition does not alone justify a decline in a resident's ability to perform ADLs.
 - b. "Unavoidable decline" may occur if he or she:
 - (1) has a debilitating disease with known functional decline;
 - (2) has suffered the onset of an acute episode that caused physical or mental disability and is receiving care to restore or maintain functional abilities; and/or
 - (3) refuses care and treatment to restore or maintain functional abilities and:
 - (a) the resident and or representative has been informed of the risk and benefits of the proposed care or treatment; and
 - (b) he or she has been offered alternative interventions to minimize further decline; and
 - (c) the refusal and information are documented in the resident's clinical record.
2. Appropriate care and services will be provided for residents who are unable to carry out ADLs independently, with the consent of the resident and in accordance with the plan of care, including appropriate support and assistance with:
 - a. hygiene (bathing, dressing, grooming, and oral care);
 - b. mobility (transfer and ambulation, including walking);
 - c. elimination (toileting);
 - d. dining (meals and snacks); and
 - e. communication (speech, language, and any functional communication systems).
3. Care and services to prevent and/or minimize functional decline will include appropriate pain management, as well as treatment for depression and symptoms of depression.
4. If residents with cognitive impairment or dementia resist care, staff will attempt to identify the underlying cause of the problem and not just assume the resident is refusing or declining care. Approaching the resident in a different way or at a different time, or having another staff member speak with the resident may be appropriate.
5. A resident's ability to perform ADLs will be measured using clinical tools, including the MDS. Functional decline or improvement will be evaluated in reference to the assessment reference date (ARD) and the following MDS definitions:
 - a. **Independent** – Resident completed activity with no help or staff oversight at any time during the last 7 days.

continues on next page

- b. **Supervision** – Oversight, encouragement or cueing provided 3 or more times during the last 7 days.
 - c. **Limited Assistance** – Resident highly involved in activity and received physical help in guided maneuvering of limb(s) or other non-weight bearing assistance 3 or more times during the last 7 days.
 - d. **Extensive Assistance** – While resident performed part of activity over the last 7 days, staff provided weight-bearing support.
 - e. **Total Dependence** – Full staff performance of an activity with no participation by resident for any aspect of the ADL activity. Resident was unwilling or unable to perform any part of the activity over entire 7-day look-back period.
6. Interventions to improve or minimize a resident’s functional abilities will be in accordance with the resident’s assessed needs, preferences, stated goals and recognized standards of practice.
 7. The resident’s response to interventions will be monitored, evaluated and revised as appropriate.

Activity Evaluation

Policy Statement

In order to promote the physical, mental and psychosocial well-being of residents, an activity evaluation is conducted and maintained for each resident at least quarterly and with any change of condition that could affect his/her participation in planned activities.

Policy Interpretation and Implementation

1. An activity evaluation is conducted as part of the comprehensive assessment to help develop an activities plan that reflects the choices and interests of the resident.
2. The resident's activity evaluation is conducted by activity department personnel, in conjunction with other staff who evaluate related factors such as functional level, cognition and medical conditions that may affect activities participation.
3. The activities director is responsible for completing, directing and/or delegating the completion of the activities component of the comprehensive assessment.
4. The resident's lifelong interests, spirituality, life roles, goals, strengths, needs and activity pursuit patterns and preferences are included in the evaluation.
5. Nursing staff communicates with a resident's attending physician to discuss and address medical conditions or medications that may affect a resident's participation in activities (for example, the resident's level of pain, the scheduling of medications that affect alertness or the need for supplemental oxygen so that a resident with pulmonary or heart disease can participate more comfortably in an activity involving movement).
6. The activity evaluation is used to develop an individual activities care plan (separate from or as part of the comprehensive care plan) that will allow the resident to participate in activities of his/her choice and interest.
7. Each resident's activities care plan relates to his/her comprehensive assessment and reflects his/her individual needs.
8. Through the interdisciplinary process, the activity evaluation and activities care plan identify if a resident is capable of pursuing activities independently, or if supervision and assistance are needed.
9. The completed activity evaluation is part of the resident's medical record and is updated as necessary, but at least quarterly..

Dental Examination/Assessment

Policy Statement

Each resident shall undergo a dental assessment prior to or within ninety (90) days of admission.

Policy Interpretation and Implementation

1. Resident shall be offered dental services as needed.
2. Dental examinations will be made by the resident’s personal dentist or by the facility’s consultant dentist.
3. Records of dental care provided shall be made a part of the resident’s medical record.
4. Upon conducting a dental examination, a resident needing dental services will be promptly referred to a dentist.

Dental Services

Policy Statement

Routine and emergency dental services are available to meet the resident's oral health services in accordance with the resident's assessment and plan of care.

Policy Interpretation and Implementation

1. Routine and 24-hour emergency dental services are provided to our residents through:
 - a. a contract agreement with a licensed dentist that comes to the facility monthly;
 - b. referral to the resident's personal dentist;
 - c. referral to community dentists; or
 - d. referral to other health care organizations that provide dental services.
2. A list of community dentists available to provide dental services to our residents is posted at each nurses' station and the list is also available from social services.
3. Residents have the right to select dentists of their choice when dental care or services are needed.
4. Selected dentists must be available to provide follow-up care. Failure of a dentist to provide follow-up services will result in the facility's right to use its consultant dentist to provide the resident's dental needs.
5. Medicare and Medicaid residents will be billed for routine and emergency dental services.
6. Social services representatives will assist residents with appointments, transportation arrangements, and for reimbursement of dental services under the state plan, if eligible.
7. Direct care staff will assist residents with denture care, including removing, cleaning and storing dentures.
8. Dentures will be protected from loss or damage, to the extent practicable, while being stored.
9. Lost or damaged dentures will be replaced at the resident's expense unless an employee or contractor of the facility is responsible for accidentally or intentionally damaging the dentures.
10. If dentures are damaged or lost, residents will be referred for dental services within 3 days. If the referral is not made within 3 days, documentation will be provided regarding what is being done to ensure that the resident is able to eat and drink adequately while awaiting the dental services; and the reason for the delay.
11. All dental services provided are recorded in the resident's medical record. A copy of the resident's dental record is provided to any facility to which the resident is transferred.

Foot Care

Policy Statement

Residents will receive appropriate care and treatment in order to maintain mobility and foot health.

Policy Interpretation and Implementation

1. Residents will be provided with foot care and treatment in accordance with professional standards of practice.
2. Overall foot care will include the care and treatment of medical conditions associated with foot complications (e.g., diabetes, peripheral vascular disease, etc.).
3. Residents will be assisted in making transportation appointments to and from specialists (podiatrist, endocrinologist, etc.) as needed.
4. Trained staff may provide routine foot care (e.g., toenail clipping) within professional standards of practice for residents without complicating disease processes. Residents with foot disorders or medical conditions associated with foot complications will be referred to qualified professionals.

Hearing Impaired Resident, Care of

Policy Statement

Staff will assist hearing impaired residents to maintain effective communication with clinicians, caregivers, other residents and visitors.

Policy Interpretation and Implementation

1. This facility does not provide comprehensive audiological evaluations or devices to assist with hearing, such as hearing aids and amplifiers.
2. Staff will assist the resident (or representative) with locating available resources, scheduling appointments and arranging transportation to obtain needed services.
3. Staff will assist residents with care and maintenance of hearing devices.
4. Staff will help residents who have lost or damaged hearing devices in obtaining services to replace the devices.
5. When interacting with the hearing impaired or deaf resident, staff will implement the following:
 - a. Evaluate the resident's preferred method of communication (signing, lip reading, tablet, etc.) with staff and other residents.
 - b. Determine the resident's awareness of and adaptation to hearing loss.
 - c. Evaluate and address avoidable obstacles to effective communication.
 - d. Regularly engage the resident in conversation using whatever communication method he or she prefers.
 - e. Encourage the resident to participate in activities that he or she enjoys.
 - f. Directly face the resident when speaking so he/she can follow facial expressions and lip read, if possible.
 - g. When speaking, enunciate clearly, slowly, and in a normal tone.
 - h. Provide pencil and paper or tablet to communicate in writing, if the resident is able.
 - i. Provide a sign language translator and written material to explain care and treatment information, as appropriate.
 - j. Evaluate resident's adaptive needs and progress at regular intervals.

Visually Impaired Resident, Care of

Policy Statement

Residents with visual impairment will be assisted with activities of daily living as appropriate.

Policy Interpretation and Implementation

1. Assistive devices to maintain vision include glasses, contact lenses, magnifying lens and any other device used by the resident to assist with visual impairment.
2. While it is not required that our facility provide devices to assist with vision, it is our responsibility to assist the resident and representatives in locating available resources (e.g., Medicare, Medicaid or local organizations), scheduling appointments and arranging transportation to obtain needed services.
3. Residents who have lost or damaged their devices will be assisted in obtaining services to replace the devices.
4. When interacting with the visually impaired resident implement the following procedures:
 - a. Use the resident’s name when speaking to him/her so he/she will know you are speaking to him/her.
 - b. Introduce anyone else who may be with you.
 - c. Always speak directly to the resident.
 - d. Assist with ADLs as needed or requested.
 - e. Let the resident know when you leave the room.
 - f. Use large lettering on any distributed written information.
5. To help the resident orient and avoid accidents in the environment implement the following practices:
 - a. Use nightlights to help the resident with dark adaptation problems.
 - b. When the resident dines, describe the location of the place setting and food on the plate according to the clock face (e.g., meat at 12 o’clock, potato at 6 o’clock, etc.).
 - c. Leave doors in the open or closed positions only. A partially closed door may be difficult for the resident to see.
 - d. Be sure that travel paths in the resident’s room are clear and present no accident hazards.
 - e. Attempt to keep the environment consistent by leaving objects in their designated locations.
 - f. Keep lighting bright and at consistent levels. Eliminate as much glare and reflection as possible.

Answering the Call Light

Level I

Purpose

The purpose of this procedure is to ensure timely responses to the resident's requests and needs.

General Guidelines

1. Upon admission and periodically as needed, explain and demonstrate use of the call light to the resident.
2. Ask the resident to return the demonstration.
3. Explain to the resident that a call system is also located in his/her bathroom.
4. Be sure that the call light is plugged in and functioning at all times.
5. When the resident is in bed or confined to a chair be sure the call light is within easy reach of the resident.
6. Some residents may not be able to use their call light. Be sure you check these residents frequently.
7. Report all defective call lights to the nurse supervisor promptly.

Steps in the Procedure

1. When answering from the call light station, turn off the signal light.
2. Identify yourself and politely respond to the resident by his/her name (e.g., "This is Mrs. Smith. Mr. Harris, how may I help you?").
 - a. If the resident needs assistance, indicate the approximate time it will take for you to respond.
 - b. If the resident's request requires another staff member, notify the individual.
 - c. If the resident's request is something you can fulfill, complete the task within five minutes if possible.
 - d. If you are uncertain as to whether or not a request can be fulfilled or if you cannot fulfill the resident's request, ask the nurse supervisor for assistance.
3. If assistance is needed when you enter the room, summon help by using the call signal.

Documentation

1. Document any significant requests or complaints made by the resident and how the request or complaint was addressed.

Backrub

Level II

Purpose

The purposes of this procedure are to provide comfort to the resident, to stimulate circulation, to relax the muscles, and to observe the resident's skin condition.

Preparation

1. Review the resident's care plan to determine if a physician's order is necessary for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Wash basin with warm water;
2. Body lotion as permitted;
3. Bath towels; and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Place the body lotion into the basin of warm water to warm the body lotion.
3. Wash and dry your hands thoroughly.
4. Assist the resident to the side-lying or prone position. Raise the side rail on the opposite side of the bed.
5. Raise the bed to a comfortable working height.
6. Half-fold the bedspread, blanket, and sheet toward the foot of the bed.
7. Loosen or remove the resident's gown or shirt.
8. Place a towel (lengthwise on the bottom sheet) close to the resident's back.
9. Pour a small amount of warm lotion into the palm of your hand.
10. Rub the palms of your hands together to spread and warm the lotion.
11. With the palms of both hands gently massage the back from the buttocks upward to the shoulder and back of the neck using long, firm circular strokes.
12. Assess the resident's skin condition for any redness, rashes, broken skin, or tender places as you perform this procedure.
13. Dry the resident's back by gently patting the skin with a towel.
14. Redress the resident.
15. Remove the towel from the bedding.
16. Discard disposable supplies in designated containers.
17. Discard towels in soiled laundry container.
18. Reposition the bed covers. Make the resident comfortable.
19. Lower the bed into lowest position and place the side rails in the appropriate position as indicated in the resident's plan of care.

continues on next page

20. Place the call light within easy reach of the resident.
21. Clean wash basin and return to designated storage area.
22. Clean the bedside stand.
23. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the backrub was performed.
2. The name and title of the individual(s) who performed the backrub.
3. All assessment data obtained during the backrub, including resident’s reported level of pain and condition of the skin.
4. How the resident tolerated the backrub.
5. If the resident refused the backrub, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Bath, Bed

Level II

Purpose

The purposes of this procedure are to promote cleanliness, provide comfort and to observe the condition of the resident's skin.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Wash basin with warm water;
2. Soap;
3. Body lotion as permitted;
4. Deodorant;
5. Wash cloth and bath towel;
6. Clean gown or pajamas;
7. Clean bed linens;
8. Bath towel, as indicated;
9. Comb and/or hairbrush; and
10. Personal protective equipment, as needed.

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Lower the headrest and/or the knee rest of the bed as tolerated.
4. Put on gloves.
5. Raise the bed level to a working position that is comfortable for both you and the resident.
6. Loosen all bedding from underneath the mattress.
7. Remove blanket and place it on the back of the chair.
8. Place the bath blanket over the top sheet.
9. Without exposing the resident, remove the top sheet from underneath the bath blanket.
10. Place the top sheet into the soiled laundry container.
11. Keeping the resident covered as much as possible, remove his/her gown or pajamas. Place soiled gown or pajamas into the soiled laundry container.
12. Fill the wash basin two-thirds full of warm water.
13. Using your elbow, test the water temperature.
14. Wash and dry hands thoroughly.
15. Place wash basin on the overbed table.

Face, Ears and Neck:

- a. Place the bath towel over the resident's chest.
- b. Make a "mitten" out of the wash cloth.
- c. Wash the resident's eyes from the nose to the outside of the face using water only.
- d. After washing one eye, fold the wash cloth and wash the other eye.

continues on next page

- e. Wash the resident's face. Use soap only if requested by the resident.
- f. Rinse the face. Dry the face by gently patting it with the bath towel.
- g. Wash the resident's ears and neck. Rinse well and dry.

Arms and Hands:

- a. Place a towel (lengthwise) under the resident's arm farthest from you.
- b. Wash the resident's shoulder, underarm, and arm. Rinse well and pat dry.
- c. Place the wash basin on the towel.
- d. Place the resident's hand into the water. Wash, rinse and dry the hand.
- e. Check the resident's fingernails, nail beds, and between the fingers. Provide nail care only when instructed.
- f. Repeat for the other arm.

Chest and Abdomen:

- a. Place the bath towel over the resident's chest. Fold the top of the bath blanket down to the abdomen.
- b. Raise the bath towel and wash the resident's chest. Rinse well and dry.
- c. Cover the resident's entire chest area with a bath towel.
- d. Fold the bath blanket down to the pubic area.
- e. Wash the resident's abdomen.
- f. Rinse the abdomen well and pat dry.
- g. Pull the bath blanket back above the abdomen and chest.
- h. Remove the bath towel from the abdomen. Do not expose the resident.
- i. Change the bath water.

Legs and Feet:

- a. Fold the bath blanket back from the resident's leg farthest from you. Expose only the one leg.
- b. Place a bath towel (lengthwise) under the leg and foot.
- c. Wash and rinse the leg and thigh. Pat dry. (Note: If the resident's condition allows, place the wash basin on the towel and gently flex the knee. Place the foot directly into the wash basin.)
- d. Wash the foot with the leg and thigh if the resident's medical condition prohibits bending the knee.
- e. Observe the toenails and the skin between the toes for redness and cracking of the skin.
- f. Dry the foot and between the toes carefully.
- g. Put the bath blanket back over the leg.
- h. Change the bath water.
- i. Repeat for the other leg.

Back:

- a. Instruct the resident to turn on his/her side with his/her back toward you. (Note: Be sure the side rail is up on the opposite side of the bed to prevent the resident from rolling out of bed.)
- b. If the resident cannot turn by himself or herself, assist as needed.
- c. Place a bath towel (lengthwise) close to the resident's back. Wash the back from the hairline to the waist using long, firm, circular strokes. Rinse well and pat dry. Wash, rinse and pat dry the buttocks.
- d. When washing the resident's back, pay particular attention to bony prominences (e.g., shoulder blades, hips, and elbows).
- e. Massage (at least 90 seconds) the back and buttocks with warm body lotion. (Note: Place the body lotion into the basin of warm water to warm the body lotion.)
- f. Remove the towel and reposition the resident on his or her back.
- g. Change the bath water.

continues on next page

Perineum:

- a. Wash, rinse well, and dry the genital and anal areas.
- b. Always wash the anal area last to avoid contaminating the urinary tract with fecal matter.
- c. If the resident can perform this task, he/she may do so. Allow for privacy at all times.
- 16. Empty and clean the wash basin with hot, soapy water.
- 17. Discard disposable supplies and laundry in the designated containers.
- 18. Remove gloves and discard in the designated container.
- 19. Wash and dry your hands thoroughly.
- 20. Put clean clothes or pajamas on the resident.
- 21. Comb/brush the resident’s hair if he/she cannot do so.
- 22. Make the resident’s bed.
- 23. Reposition the bed covers.
- 24. Lower the bed into lowest position and place the side rails in the appropriate position.
- 25. Place the call light within easy reach of the resident.
- 26. Return wash basin to designated storage area.
- 27. Clean the overbed table and return it to its proper position.
- 28. Wash and dry your hands thoroughly.

Documentation

- 1. The date and time the bed bath was performed.
- 2. The name and title of the individual(s) who performed the bed bath.
- 3. All assessment data obtained during the bed bath.
- 4. How the resident tolerated the bed bath.
- 5. If the resident refused the bed bath, the reason(s) why and the intervention taken.
- 6. The signature and title of the person recording the data.

Reporting

- 1. Notify the supervisor if the resident refuses the bed bath.
- 2. Report other information in accordance with facility policy and professional standards of practice.

Bath, Shower/Tub

Level II

Purpose

The purposes of this procedure are to promote cleanliness, provide comfort to the resident and to observe the condition of the resident's skin.

General Guidelines

1. Be sure that the bath area is at a comfortable temperature for the resident.
2. Stay with the resident throughout the bath. Never leave the resident unattended in the tub or shower.
3. Use the emergency call signal for assistance, if needed.
4. When transporting the resident to and from the bath area, make sure that the resident is covered and his or her privacy is maintained.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Portable bath chair;
2. Lotion, deodorant, etc.;
3. Robe and slippers;
4. Face cloth and bath towels;
5. Clean gown, pajamas, or street clothing;
6. Disinfectant solution;
7. Bath thermometer;
8. Bath blanket, as indicated;
9. Comb and/or hairbrush; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Offer the resident the bedpan or urinal.
4. Put a robe and slippers on the resident.
5. Assist the resident into the bath chair, if applicable. Be sure the wheels are locked, and/or the chair is steady to prevent the resident from falling.
6. Cover the resident from the neck down with the bath blanket.
7. Return the cubicle curtain to the open position.
8. Transport the resident to the bath area.
9. Be sure the tub or shower is clean.
10. Fill the tub approximately one-half (1/2) full with warm water (105°F). Test the water with the bath thermometer or your elbow. If using a shower regulate the temperature and the flow of the water.
11. Place one (1) towel in the tub for the resident to sit on.

continues on next page

12. Place a non-skid bath mat on the floor where the resident will step in/out of the tub or shower.
13. Roll the bath chair next to the tub or shower.
14. Be sure the bath chair is firmly positioned and locked.
15. Remove the resident's slippers and the bath blanket from around the resident.
16. Instruct the resident to stand. Assist as needed. Remove the resident's robe.
17. Assist the resident into the tub or shower.
18. If feasible, the resident may bathe him- or herself. Assist as needed.
19. When the resident has finished his or her bath, ensure his or her skin is free of soap.
20. Dry the resident from the head to the waist before assisting him or her from the tub or shower. Observe skin for any rashes, reddened areas, skin discoloration, etc.
21. Assist the resident out of the tub or shower. Hold firmly to the resident. Move slowly.
22. Place a towel in the bath chair for the resident to sit on.
23. Assist the resident into the chair. Dry lower torso (i.e., thighs, legs, feet, etc.). Observe skin for any rashes, reddened areas, swelling, etc.
24. Once the resident's skin has been dried ask him or her to stand. Assist as needed.
25. Assist the resident back into his or her robe. Remove the towel from the bath seat.
26. Be sure the bath chair seat is dry. Ask the resident to sit down. Put slippers on the resident's feet.
27. Cover the resident, from the neck down, with the bath blanket.
28. Pick up all towels, bath cloths, soiled clothing, etc. Discard in the soiled laundry container inside the bath area.
29. Transport the resident back to his or her room.
30. Pull the cubicle curtain around the resident's bed for privacy.
31. Assist with dressing and grooming as needed.
32. Assist the resident into bed or chair.
33. Place the call signal within easy reach of the resident.
34. Wash and dry your hands thoroughly.
35. Clean the bath tub with a disinfectant solution.

Documentation

1. The date and time the shower/tub bath was performed.
2. The name and title of the individual(s) who assisted the resident with the shower/tub bath.
3. All assessment data (e.g., any reddened areas, sores, etc., on the resident's skin) obtained during the shower/tub bath.
4. How the resident tolerated the shower/tub bath.
5. If the resident refused the shower/tub bath, the reason(s).

Reporting

1. Notify the supervisor if the resident refuses the shower/tub bath.
2. Notify the physician of any skin areas that may need to be treated.
3. Report other information in accordance with facility policy and professional standards of practice.

Bathroom, Assisting a Resident to

Level II

Purpose

The purpose of this procedure is to assist the resident with ambulating to the bathroom.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Position the bed so that the resident can get out of and back into the bed easily.
3. Ask the resident to sit up on the edge of the bed. Assist as necessary.
4. If assisting the resident to a wheelchair, be sure the wheels are locked.
5. Assist the resident in putting on his or her slippers/shoes, as necessary.
6. Assist the resident to a standing position. Move slowly. Allow the resident time to maintain his or her balance.
7. Walk on the resident's weak side. Provide support as necessary.
8. Walk next to the resident with one arm supporting the resident's bent arm and the other arm around the resident's back at waist level.
9. If necessary for support, use a gait belt for safety.
10. Assist the resident to the bathroom. Close the bathroom door.
11. Assist the resident with removing clothing as necessary.
12. If recording the resident's output, ensure the commode hat is properly positioned.
13. Help the resident sit down on the commode. Ask him or her to use safety bars as necessary.
14. Provide the resident with as much privacy as possible.
15. Wait outside the door, if safety permits. Ask the resident to signal when done.
16. When the resident has signaled or called for you, return to the bathroom.
17. If the resident needs help in cleaning himself or herself, put on gloves. Clean the perineum from front to back with toilet tissue. Wash the area with soap and water as necessary. Dry the area with a towel.
18. Remove and discard gloves into designated container.
19. Wash your hands.
20. Assist the resident to stand. Move slowly. Allow the resident an opportunity to maintain his or her balance.
21. Reposition the resident's clothing.
22. Allow the resident to wash his or her hands.
23. Assist the resident back into the bed or chair.
24. Position the resident into a comfortable position.
25. Place the call light within easy reach of the resident.
26. Clean the bathroom as necessary (i.e., flush commode, wipe up spills, etc.).
27. Wash and dry your hands thoroughly.

continues on next page

Documentation

The following information should be recorded on the resident's ADL record and/or in the resident's medical record:

1. The date and time the resident was assisted to the bathroom.
2. The name and title of the individual(s) who assisted the resident.
3. Any changes in the resident's ability to ambulate to the bathroom.
4. If recording output, document the amount of urine.
5. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Bed, Making an Occupied

Level II

Purpose

The purpose of this procedure is to provide the resident with a clean and comfortable environment and to prevent skin irritation and breakdown.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the linen supplies that will be needed.

General Guidelines

Infection Control:

1. Take only the linen supplies that you need. Do not take extra supplies with you. Once they are taken into the room they become contaminated (dirty) and cannot be used elsewhere.
2. Do not shake the bed linen. Shaking the linen will spread germs throughout the room.
3. Do not allow soiled linen to come into contact with your clothing.
4. Do not put soiled linen on the floor. As you remove it, place it into the container you are using for soiled laundry/linen.

Protecting the resident's skin:

1. Smooth wrinkles from the bottom sheet.
2. Do not let the plastic touch the resident's skin. Cover plastic draw sheets and mattress protectors with a cotton sheet.
3. Do not use torn linen. Place it in the torn linen box inside the linen closet.
4. Position sheets so the seams and hem are kept away from the resident's skin.
5. Do not use pins of any type on the linen.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. One (1) pillowcase;
2. Two (2) sheets;
3. One (1) blanket, if necessary;
4. One (1) bedspread, if necessary;
5. One (1) plastic draw sheet, per facility policy;
6. One (1) cotton draw sheet, if necessary;
7. Disposable bed liners, if necessary;
8. Laundry bag or container for soiled laundry/linen; and
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure: Occupied Bed

1. Wash and dry your hands thoroughly.
2. Wear clean gloves.
3. Place clean linen on a chair in the order in which the linens will be used.

Positioning the Resident:

1. If the resident's physical or medical condition permits, lower the headrest and/or the knee rest of the bed.
2. Remove the pillow from under the resident's head, if clinically appropriate. Remove the soiled case and put the clean case on the pillow. Put the pillow on the chair. Put the soiled linen in the soiled pillowcase.
3. Raise the bed to a comfortable working height and lock in place. Maintain good body mechanics.
4. Loosen all bedding from underneath the mattress. Leave the bedding hanging loose on all sides.
5. If the bedspread and/or blanket are to be reused, fold toward the foot of the bed. Fold again (quarter-fold). Remove and place on the back of the chair. Leave the resident covered with the top sheet.
6. Raise the bedside rail on the opposite side of the bed from where you will be working. Lock it in place.
7. Ask the resident to turn on his or her side away from you and face the side rail.
8. If the resident cannot turn by himself/herself, assist as needed.

Removing/Replacing Linens:

1. Fold/roll the bottom sheet toward the resident (lengthwise from top to bottom). Tuck the sheet against the resident's back. The top sheet should keep the soiled linen from coming into contact with the resident's skin.
2. With the mattress exposed, check for any soiling or wetting. Wash and dry it with a paper towel as necessary.
3. Take one of the clean sheets and fold it in half lengthwise, exposing the bottom of the sheet. Do not let the sheet touch your clothing or the floor.
4. Place the clean sheet on the mattress with the fold running along the middle of the mattress. The small hem end should be at the foot of the mattress.
5. Fold the top quarter of the sheet toward the resident's back.
6. Beginning at the head of the bed, tuck the portion of the sheet closest to you under the mattress starting with the top and then moving to bottom.
7. Miter the corners and tuck in the side. Smooth the sheet.
8. Flatten the roll sheet (the part touching the resident's back) as much as possible.
9. Raise the bedside rails on your side and lock into position.
10. Go to the opposite side of the bed. Lower the bedside rails.
11. Ask the resident to turn over to his or her other side. Assist as needed.
12. Remove the soiled bottom sheet. Roll it up without touching your clothing. Discard it in the soiled laundry container or biohazard container (e.g., red bags).
13. Check the mattress for any soiling or wetting. Clean as necessary.
14. Pull the clean bottom sheet towards you until it is completely unfolded.
15. Tuck in and miter corners.

Repositioning the Resident:

1. Ask the resident to roll over on his or her back to the center of the bed. Assist as necessary.
2. Place the pillow back under the resident's head. Remove the top sheet and put it into the soiled laundry container.
3. Remove gloves and discard into designated container.

continues on next page

4. Wash and dry your hands thoroughly.
5. Spread the clean top sheet over the resident with the wide hem at the head of the bed.
6. Tuck the clean top sheet under the mattress at the foot of the bed leaving enough room for the resident to move his or her feet freely. Miter the corners.
7. Spread the blanket/bedspread over the top sheet.
8. Lower the bed into lowest position and place the side rails in the appropriate position as indicated in the resident’s plan of care.
9. Reposition the head of the bed to a comfortable position for the resident, unless otherwise instructed.
10. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded on the resident’s ADL record and/or in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the supervisor if faulty equipment or unsafe conditions (e.g., loose wheels, broken latches, loose side rails, etc.) are observed.
3. Report other information in accordance with facility policy and professional standards of practice.

Bed, Making an Unoccupied

Level I

Purpose

The purpose of this procedure is to provide the resident who is able to get out of bed with a clean, comfortable bed.

Preparation

Assemble the linen supplies that will be needed.

General Guidelines

Infection Control:

1. Take only the linen supplies that you need. Do not take extra supplies with you. Once they are taken into the room they become contaminated (dirty) and cannot be used elsewhere.
2. Do not shake the bed linen. Shaking the linen will spread germs throughout the room.
3. Do not allow soiled linen to come into contact with your clothing.
4. Do not put soiled linen on the floor. As you remove it, place it into the container you are using for soiled laundry/linen.

Protecting the resident's skin:

1. Smooth wrinkles from the bottom sheet.
2. Do not let the plastic touch the resident's skin. Cover plastic draw sheets and mattress protectors with a cotton sheet.
3. Do not use torn linen. Place it in the torn linen box inside the linen closet.
4. Position sheets so the seams and hem are kept away from the resident's skin.
5. Do not use pins of any type on the linen.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. One (1) pillowcase;
2. Two (2) sheets;
3. One (1) blanket, if necessary;
4. One (1) bedspread, if necessary;
5. One (1) plastic draw sheet, per facility policy;
6. One (1) cotton draw sheet, if necessary;
7. Disposable bed liners, if necessary;
8. Laundry bag or container for soiled laundry/linen;
9. Soap and water;
10. Paper towels; and
11. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Wear clean gloves.
3. Place clean linen on a chair in the order in which the linens will be used.

Removing Soiled Linen:

1. Put the bed in a flat position.
2. Remove the pillow from the bed. Remove the soiled case and put the pillow on the chair. (Note: Put the soiled linen in the soiled pillowcase.)
3. Raise the bed to a comfortable working height and lock in place. Maintain good body mechanics.
4. Loosen all bedding from underneath the mattress. Leave the bedding hanging loose on all sides.
5. If the bedspread and/or blanket are to be reused, fold toward the foot of the bed. Fold again (quarter-fold). Remove and place on the back of the chair.
6. Remove the soiled linen. Roll it up without touching your clothing. Do not let the soiled linen touch the floor. Discard it in the soiled laundry container or biohazard bags.
7. If the mattress has slipped out of place, move it back until the top of the mattress touches the head of the bed.
8. If soiled or wet, wash and dry it with a paper towel.
9. Remove gloves and discard into designated container.
10. Wash and dry your hands thoroughly.

Placing Clean Linen:

1. Take one of the clean sheets and fold it in half lengthwise, exposing the bottom of the sheet. Do not let the sheet touch your clothing or the floor.
2. Place the clean sheet on the mattress with the fold running along the middle of the mattress. The small hem end should be at the foot of the mattress.
3. Unfold the sheet. It should now hang evenly over each side of the bed.
4. Miter the corners at the head and foot of the bed. Tuck in the clean bottom sheet on your side from the head to the foot of the mattress.
5. Move to the other side of the bed. Pull the sheet tight. Miter the corners and tuck the sheet under the mattress. Be sure the sheet is free of wrinkles to prevent skin irritation.
6. If a plastic draw sheet is used, pull it tightly over the clean bottom sheet. Tuck it under the mattress.
7. Place a clean cotton draw sheet over the plastic draw sheet (if used). Pull it tight. Tuck it under the mattress. Be sure the fold of the draw sheet is facing the head of the bed.
8. Take the remaining sheet and fold it in half lengthwise. Place the clean sheet on the mattress with the fold running along the middle of the mattress.
9. Open the top sheet. It should now hang evenly over each side of the bed. The excess sheet will be over the foot of the bed.
10. Place the spread over the top sheet.
11. Tuck in the top sheet and spread at the foot of the bed. Miter the corners.
12. Smooth the top sheet and spread from the foot to the head. Fold down the top hem of the top sheet over the spread.
13. Go to the opposite side of the bed. Finish making the bed. Pull the bottom sheet tight before each tuck to remove any wrinkles.

continues on next page

14. Put the blanket (folded) on the foot of the resident’s bed, or store it in the resident’s closet, whichever the resident chooses.
15. Put the pillowcase on the pillow.
16. Lower the bed to the lowest position.
17. Remove the soiled linen from the room and discard in its designated container.
18. Wash and dry your hands thoroughly.

Reporting

1. Notify the supervisor if faulty equipment or unsafe conditions (e.g., loose wheels, broken latches, loose side rails, etc.) are observed. Report other information in accordance with facility policy and professional standards of practice.

Bedpan/Urinal, Offering/Removing

Level II

Purpose

The purpose of this procedure is to provide the resident with bedpan and/or urinal assistance.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Check to see if the resident is on intake and output before discarding the urine and feces.
2. Do not allow the resident to sit on a bedpan for extended periods. This is not only uncomfortable to the resident, it also causes skin breakdown.
3. If the resident prefers to keep a urinal at his bedside, check it frequently. Empty and clean it as necessary. Note on the resident's care plan his request to keep the urinal at his bedside.
4. Collect specimens as required.
5. Check the feces or urine for unusual appearance. Report findings to your supervisor.
6. Encourage the resident to assist in the procedure as much as possible.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Bedpan or urinal (or fracture pan if the resident's condition requires);
2. Disposable bedpan cover or paper towel;
3. Toilet tissue;
4. Wash basin;
5. Soap;
6. Towel;
7. Wash cloth;
8. Cleaning disinfectant and cleaning cloth; and
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. If the resident's medical condition permits, raise the head of the bed until the resident is in a comfortable position.
4. Put on gloves.

continues on next page

Assistance with a Urinal:

1. Remove the urinal from the bedside stand. Be sure that it is clean and dry.
2. Fold the bedspread or blanket toward the foot of the bed.
3. Fold the sheet down to the lower part of the body.
4. Raise the gown (or lower the pajamas).
5. If the resident can place or position the urinal on his own, allow him to do so.
6. If the resident cannot place or position the urinal, gently lift his penis and place it inside the urinal. Position the urinal at an angle between his legs.
7. Position the sheet back over the resident.
8. Put the toilet tissue and call light within easy reach of the resident.
9. Allow the resident as much privacy as possible. Tell the resident to call you when he has finished.
10. Remove gloves. Discard into designated container. Wash and dry your hands thoroughly. If permitted, leave the room to give the resident privacy.
11. When the resident calls that he has finished, return to the room.
12. Wash and dry your hands thoroughly. Put on gloves.
13. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
14. Fold back the sheet. Remove the urinal. Place it on a paper towel on the floor next to the bedside stand. Cover the urinal immediately with a urinal cover or paper towel. Be careful of spills.
15. If the resident cannot clean himself, clean the perineal area from front to back with toilet tissue. Wash area with soap and water as necessary. Dry with towel.

Assistance with a Bedpan:

1. Remove the bedpan from the bedside stand. Take it to the bathroom and run warm water over it to warm the bedpan before putting it underneath the resident.
2. Dry the bedpan with a paper towel. Discard paper towels into designated container.
3. Take the bedpan back to the bedside.
4. Fold the bedspread or blanket toward the foot of the bed.
5. Fold the sheet down to the lower part of the body.
6. Raise the gown (or lower the pajamas).
7. Instruct the resident to bend his or her knees and put his or her feet flat on the mattress. Assist as necessary.
8. Instruct the resident to raise his or her hips. (Note: If necessary assist the resident in raising the buttocks by slipping your hand under the lower part of the resident's back.)
9. With your free hand, position the bedpan with the seat of the bedpan under the buttocks. (Note: Be sure that the bedpan is comfortable to the resident and positioned in such a manner to adequately collect the urine or feces.)
10. If the resident is unable to lift his or her buttocks to get on or off the bedpan, turn the resident on his or her side with the back facing you. Put the bedpan against the resident's buttocks. Roll the resident back onto the bedpan.
11. Position the sheet over the resident.
12. Put the toilet tissue and call light within easy reach of the resident.
13. Allow the resident as much privacy as possible. Tell the resident to call you when he or she has finished.
14. Remove gloves. Discard into designated container. Wash and dry your hands thoroughly. If permitted, leave the room to give the resident privacy.
15. When the resident calls that he or she has finished, return to the room.

continues on next page

16. Wash and dry your hands thoroughly. Put on gloves.
17. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
18. Fold back the sheet. Assist the resident in raising his or her hips. (Note: If the resident was rolled onto the bedpan, it may require two (2) assistants to remove the bedpan and clean the resident. Summon assistance as necessary.)
19. Remove the bedpan. Place it on a paper towel on the floor next to the bedside stand. Cover the bedpan immediately with a bedpan cover or paper towel. Be careful of spills.

After Assisting the Resident:

1. If the resident cannot clean himself or herself, clean the perineum from front to back with toilet tissue. Wash area with soap and water as necessary. Dry with towel.
2. Return gown (or pajamas) to appropriate position.
3. Reposition the bed covers. Make the resident comfortable. (Note: If bedmaking is to be completed, follow such procedures after this procedure has been completed.)
4. Place the call light within easy reach of the resident.
5. Take the bedpan or urinal into the bathroom. Check the feces or urine for unusual appearance.
6. Measure and record output as necessary. Collect specimens as instructed.
7. Empty the bedpan or urinal into the commode. Flush the commode.
8. Clean the bedpan or urinal. Wipe dry with a clean paper towel. Discard paper towel into designated container. Store the bedpan or urinal per facility policy. Do not leave it in the bathroom or on the floor.
9. Remove gloves. Discard into designated container. Wash and dry your hands thoroughly.
10. Allow the resident to wash his or her hands. (Note: Use wash basin or clean wash cloth. Be sure water in basin is clean.)
11. Position the bed as tolerated by the resident or as resident's medical condition requires.
12. Discard soiled towels, wash cloth, etc., in the soiled laundry container.
13. Discard disposable items into designated containers.
14. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
15. Clean wash basin and return to designated storage area.
16. Clean the bedside table.
17. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded on the resident's ADL and/or in the resident's medical record:

1. The date and time the bedpan/urinal was offered.
2. The name and title of the individual(s) who offered the bedpan/urinal to the resident.
3. The amount and character of output.
4. If a specimen was collected.
5. All assessment data (e.g., skin condition) obtained during the procedure.
6. How the resident tolerated the procedure or any changes in the resident's ability to participate in the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the bedpan/urinal.
2. Report other information in accordance with facility policy and professional standards of practice.

Bedside Commode, Offering/Removing

Level II

Purpose

The purpose of this procedure is to assist the resident with using a bedside commode.

Preparation

1. Review the resident's care plan and assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Portable bedside commode;
2. Bedpan;
3. Disposable bedpan cover or paper towel;
4. Toilet tissue;
5. Wash basin;
6. Soap;
7. Towel;
8. Wash cloth; and
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Position the bed so that the resident can get out of and back into the bed easily.
4. Place the portable commode next to the resident's bed and lock the wheels. Open the cover.
5. Put on gloves.
6. Insert a clean bedpan or commode pail under the toilet seat.
7. Assist the resident in putting on his or her shoes/slippers.
8. Assist the resident in getting out of the bed and onto the commode using appropriate transfer technique. Put the toilet tissue and call light within easy reach of the resident.
9. Allow the resident as much privacy as possible. Tell the resident to call you when he or she has finished.
10. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
11. If permitted, leave the room to give the resident privacy.
12. When the resident calls that he or she has finished, return to the room.
13. Wash your hands. Put on gloves.
14. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach. This water will be used to wash the resident's hands.
15. Help the resident clean him or herself with toilet tissue or warm water and a washcloth.
16. Remove gloves and wash your hands.

continues on next page

17. Assist the resident back into bed using appropriate transfer technique.
18. Close the cover on the commode.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. Apply gloves.
22. Allow the resident to wash his or her hands. (Use wash basin or clean wash cloth. Be sure water in basin is clean.)
23. Take the bedpan into the bathroom. Check the feces or urine for unusual appearance.
24. Measure and record output. Collect specimens as instructed.
25. Empty and clean the bedpan.
26. Wipe down the portable commode. Store it in its designated storage area.
27. Remove gloves. Wash and dry your hands.
28. Clean wash basin and return to designated storage area.
29. Wash and dry your hands.

Documentation

The following information should be recorded in the resident’s ADL record and/or the medical record:

1. The date and time the bedside commode was offered.
2. The name and title of the individual(s) who offered the bedside commode to the resident.
3. The amount and character of output.
4. If a specimen was collected.
5. All assessment data (e.g., skin condition) obtained during the procedure.
6. How the resident tolerated the procedure or any changes in the resident’s ability to participate in the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Brushing and Combing Hair

Level II

Purpose

The purpose of this procedure is to provide hair and scalp care.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. The resident's hair should be brushed and combed every morning before breakfast and whenever necessary throughout the day.
2. Encourage the resident to brush and comb his or her hair. (This is a good range of motion exercise for the resident's hands, arms, and shoulders and it promotes independence and dignity.)

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Hair brush;
2. Comb;
3. Towel(s), as necessary for comatose or bedfast residents;
4. Hand mirror; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Place a towel across the pillow under the resident's head as necessary to prevent hair accumulation in the bed.
4. If the resident can sit up in bed, drape the towel around his or her shoulders as necessary.
5. If the resident is wearing glasses, ask him or her to remove them. Place them on the bedside stand or overbed table.
6. Brush the resident's hair carefully, gently, and thoroughly. Style the hair according to the resident's wishes.
7. Comb only small amounts of hair at a time.
8. If the resident cannot sit up in bed, separate the hair into small sections. Comb each section separately using a downward motion.
9. Remove the towel. Discard into the soiled linen container.
10. Take the hand held mirror and let the resident see his or her hair. Allow the resident to hold the mirror if possible.
11. Clean the brush and comb as necessary. Store the brush, comb and mirror in the bedside stand.

continues on next page

12. Clean the overbed table and return it to its proper position.
13. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
14. Reposition the bed covers. Assist the resident to a comfortable position.
15. Place the call light within easy reach of the resident.
16. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that hair and scalp care was given.
2. The name and title of the individual(s) who assisted with the hair and scalp care.
3. The condition of the resident's scalp (i.e., any redness, scaling, sores, etc.).
4. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
5. Any problems or complaints made by the resident related to the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Compress or Soak, Applying Cold

Level II

Purpose

The purposes of this procedure are to prevent and/or reduce swelling, relieve pain, control bleeding, and/or help lower the body temperature.

General Guidelines

1. This procedure requires an order or facility protocol.
2. Do not apply a cold compress to a resident who is a diabetic or has circulatory impairment unless there is an order from the practitioner.

Equipment and Supplies

The following equipment and supplies will be necessary:

1. Soak basin;
2. Pitcher of cold water (with ice cubes if ordered);
3. Bath towel;
4. Bath blanket;
5. Bed protector (disposable or plastic);
6. Personal protective equipment, as needed; and
7. Compress (towel, washcloth or gauze).

Steps in the Procedure

1. Wash your hands thoroughly.
2. Assist the resident into a safe, comfortable position.

Applying a Cold Soak:

1. Position the soak basin so that the limb can rest easily in the solution.
2. Place the bed protector on the bed.
3. Fill the water pitcher with cold water.
4. Pour the water into the basin.
5. Place the resident's arm or leg into the soak basin.
6. Change the water as needed to keep it cold.
7. While changing the water, wrap the affected area in a towel.
8. Check the skin that is soaking every five (5) minutes. If the skin appears white or blue, stop treatment and wrap the affected area in a towel. Notify the nurse.
9. If the resident complains of being cold cover him or her with a blanket.
10. Unless otherwise instructed, or the resident does not tolerate, soak the limb for twenty (20) minutes.

Applying a Cold Compress:

1. Place the bed protector on the bed.
2. Fill the water pitcher with cold water.
3. Pour the water into the basin.

continues on next page

4. Dip the compress into the water and wring it out thoroughly.
5. Apply the compress to the area to be treated.
6. Do not cover the compress.
7. If the resident complains of being cold or chilled, cover him or her with a blanket.
8. Change the compress as often as necessary to keep it cold.
9. Check the skin every five (5) minutes. If the skin appears white or blue, stop treatment and wrap the affected area in a towel. Notify the nurse.

After Treatment:

1. Remove the soak or compress after the ordered timeframe.
2. Pat the area dry with a towel. Do not rub the skin.
3. Reposition the bed covers. Make the resident comfortable.
4. Discard waste and clean the area.
5. Wash and dry your hands thoroughly.

Documentation

Record the following information in the resident’s medical record, as indicated:

1. The date and time that the procedure was given.
2. The name and title of the individual(s) who performed the procedure.
3. The type of treatment administered (soak or compress).
4. Length of time applied.
5. The condition of the resident’s skin.
6. How the resident tolerated the procedure.
7. Any relevant information about the resident’s condition obtained during the procedure.
8. The signature and title of the person recording the data.

Reporting

Report the following to the resident’s nurse, as indicated:

1. Any changes in the resident’s condition noted during the procedure.
2. Unusual changes to the skin.
3. If the resident did not tolerate the procedure.
4. If the procedure was not completed for any reason.

Compress or Soak, Applying Warm

Level II

Purpose

The purposes of this procedure are to ease the body of pain caused by inflammation and congestion, to aid in the treatment of the resident's condition, to promote drainage in infections, to improve circulation and to apply heat to an area.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Be sure that the resident is in a safe and comfortable position to prevent falls and/or accidents.
2. Avoid spilling warm water on the resident, bed and the floor.
3. Check the resident's skin often for redness or discoloration.
4. Should you observe any of the above conditions, cease the treatment, cover the resident and summon the Staff/Charge Nurse at once.
5. Listen to the resident's complaints. Report them to the Staff/Charge Nurse.
6. Should you have reason to believe that the resident is being burned from the application, cease the procedure, cover the resident, and summon the Staff/Charge Nurse.
7. Unless otherwise instructed, do not apply a warm compress to a resident who is a diabetic or has circulatory impairments.

Equipment and Supplies

The following equipment and supplies will be necessary when applying a **warm soak**:

1. Soak basin (arm or foot, as indicated);
2. Pitcher of warm water (105°F);
3. Bath thermometer;
4. Bath towel;
5. Bath blanket;
6. Bed protector (disposable or plastic); and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

The following equipment and supplies will be necessary when applying a **warm compress**:

1. Basin;
2. Compress (towel, wash cloth, or gauze pad);
3. Pitcher of warm water (115°F);
4. Bath thermometer;
5. Bath towel;
6. Bath blanket;
7. Bed protector (disposable or plastic); and

continues on next page

8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Assist the resident into a safe, comfortable position.

If applying a warm soak:

1. Position the soak basin so that the limb can rest easily in the solution.
2. Place the bed protector under the part of the body that will be treated with the warm application. (Note: If using a plastic sheet or pad, keep the plastic from touching the resident's skin.)
3. Fill the water pitcher with warm water (105°F).
4. Fill the soak basin until it is one-half full of warm water.
5. Gradually place the resident's arm or leg into the warm solution.
6. Change the water as often as necessary to keep it warm. Pour used water down the commode. Flush the commode.
7. When changing soak water, remove the limb being treated. Wrap it in a towel to keep it warm.
8. Unless otherwise instructed, check the skin of the limb being soaked every five (5) minutes. (Note: If the skin appears to be reddened or discolored, cease the treatment. Cover the area with a towel. Summon the Staff/Charge Nurse.)
9. Should the resident become weak or complain of being cold, cease the treatment, cover the resident with a blanket and summon the Staff/Charge Nurse.
10. Unless otherwise instructed, soak the limb for twenty (20) minutes.

If applying a warm compress:

1. Expose the area to be treated. Avoid unnecessary exposure.
2. Place the bed protector under the part of the body that will be treated with the warm application. (Note: If using a plastic sheet or pad, keep the plastic from touching the resident's skin.)
3. Fill the pitcher with warm water (115°F). Check the water temperature with the bath thermometer.
4. Pour the water into the basin.
5. Dip the compress (towel, wash cloth, or gauze pad) into the water and wring it out thoroughly.
6. Gently apply the compress to the area to be treated. Avoid spilling water on the resident.
7. Wrap the entire area with the bath towel.
8. Wrap the plastic sheet around the towel and compress. (Note: Keep the plastic from touching the resident's skin.)
9. If the resident complains of being cold or chilled, cease the procedure, cover the resident with a blanket, and summon the Staff/Charge Nurse.
10. Change the compress as often as necessary to keep the application warm.
11. Unless otherwise instructed, check the skin under the application every five (5) minutes. (Note: If the skin appears red, remove the compress. Cover the area with a towel. Summon the Staff/Charge Nurse.)
12. Unless otherwise instructed apply the warm compress for twenty (20) minutes.

After Treatment

1. After the treatment has been completed, pat the area dry with a towel. Do not rub the skin.
2. Reposition the bed covers. Make the resident comfortable.
3. Place the call light within easy reach of the resident.
4. Discard soiled towels and linen into the soiled laundry container. Red bag as necessary.

continues on next page

5. Discard all disposables into designated containers.
6. Pour liquids down the commode. Flush the commode.
7. Wash and rinse the basin. If stored in the resident’s room, store in the proper place.
8. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.
9. Clean and sanitize all reusable equipment. Store in designated areas.
10. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time that the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The type of treatment administered (soak or compress).
4. The condition of the resident’s skin.
5. If and how the resident participated in the procedure.
6. All assessment data obtained during the procedure.
7. How the resident tolerated the procedure.
8. If the resident refused the procedure, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Dentures, Cleaning and Storing

Level II

Purpose

The purposes of this procedure are to cleanse and freshen the resident's mouth, to clean the resident's dentures, to prevent infections of the mouth, to protect the resident's dentures from breakage when dentures are out of the resident's mouth, and to store dentures at bedtime.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Provide denture care before breakfast and at bedtime. Encourage and assist the resident as needed to rinse his or her mouth after each meal.
2. Handle dentures carefully to prevent loss or breakage. Store dentures whenever they are not in the resident's mouth.
3. Loose or poor fitting dentures can cause gum sores and prevent the resident from chewing his or her food properly. If a resident is not chewing his or her food thoroughly, report it to your supervisor.
4. Encourage the resident to keep dentures in his or her mouth as much as possible. When dentures are left out of the mouth for several days, the bone structure to the mouth changes and the gums will shrink causing the dentures to fit improperly.
5. As you provide denture care examine the resident's mouth and gums for any paleness of the gums, mouth sores, bleeding, or areas of discoloration.
6. Encourage the resident to perform as much of the procedure as possible.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Toothbrush (soft bristles);
2. Toothpaste or denture cleaner;
3. Clean emesis basin;
4. Towel;
5. Fresh water;
6. Mouthwash;
7. Disposable denture cup/container (with cover);
8. Straw (flexible);
9. Tissue or gauze pads;
10. Paper towels;
11. Denture adhesive, as requested; and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Spread the towel under the resident's chin and across the chest to protect the resident's clothing and/or bed covers.
4. Place tissue/gauze pads into the emesis basin.
5. Ask the resident to remove his or her dentures. If the resident cannot remove his or her dentures:
 - a. Put on gloves.
 - b. Instruct the resident to rinse his or her mouth with water.
 - c. Place a tissue/gauze pad over the fingers of the hand you are using to remove the dentures.
 - d. Remove the upper dentures. Gently move the dentures from side to side and pull down. Place dentures in the emesis basin.
 - e. Remove the lower dentures. Use an upward motion. Move the dentures to the inside of the mouth then remove them. Place dentures in the emesis basin.
6. Take the lined emesis basin to the sink.
7. Clean the dentures by brushing them with a denture cleaner or toothpaste.
8. Hold the dentures in the palm of your hand and over the sink while brushing to prevent them from dropping on the floor. Rinse dentures thoroughly.
9. Fill the denture cup one-half (1/2) full with fresh water and one-half (1/2) full of mouthwash. Place dentures into the denture cup.
10. Take the denture cup and emesis basin to the bedside table. Leave dentures in the cup until the resident is ready to replace them in his or her mouth.
11. Instruct the resident to rinse out his or her mouth thoroughly with fresh water or with a mouthwash solution.
12. Instruct the resident to spit the rinse solution into the emesis basin. Provide mouth care as necessary.
13. Dry the resident's face and chin area.
14. If the resident wishes to replace the dentures into his or her mouth, moisten the dentures so that they will fit easily. Use adhesive paste as requested. When handling the dentures hold with a tissue or gauze pad.
15. To assist the resident in replacing the dentures:
 - a. Ask the resident to rinse his or her mouth with water. Assist as necessary.
 - b. Apply denture adhesive or paste as requested by the resident.
 - c. Pick dentures up with a tissue or gauze pad.
 - d. Replace the upper/lower dentures. Ask resident to assist you in properly fitting the dentures.
 - e. Dry the resident's face and chin area as necessary.
16. Remove gloves and discard into designated container. Wash your hands.
17. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
18. Leave the denture cup, with the cleaning solution, on the resident's bedside stand. Put it within easy reach of the resident. Be sure the denture cup is properly labeled with the resident's name and room number.
19. Discard disposable equipment and supplies in designated containers.
20. Discard towels in soiled laundry container.
21. Clean the overbed table and return it to its proper position.
22. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.

continues on next page

23. Reposition the bed covers. Help the resident to a comfortable position.
24. Place the call light within easy reach of the resident.
25. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the denture care was performed. (Note "a.m." or "p.m." care on the ADL record.)
2. The name and title of the individual(s) who performed the denture care. Initial the appropriate area on the ADL record.
3. All assessment data obtained concerning the resident's mouth. The certified nursing assistant should report to the licensed nurse to record in the medical record.
4. Complaints of pain or discomfort of mouth related to dentures. The certified nursing assistant should report to the licensed nurse to record in the medical record.
5. Damaged, broken, ill-fitting, or lost dentures. The certified nursing assistant should report to the licensed nurse or social services, as required by facility policy.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the denture care.
2. Report other information in accordance with facility policy and professional standards of practice.

Dressing and Undressing, Assisting the Resident with

Level II

Purpose

The purposes of this procedure are to assist the resident as necessary with dressing and undressing and to promote cleanliness.

General Guidelines

1. Allow the resident as much privacy as possible while he or she is dressing or undressing.
2. Dress the resident in his or her own clothing. Do not swap clothing among residents.
3. Report clothing needs and repairs to the Staff/Charge Nurse or to social services.
4. During the procedure, observe the resident's skin for any redness, discoloration, rashes, sores, etc.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.

Assisting the resident with undressing:

1. While undressing, support the resident from his or her strong side.
2. Ask the resident to sit down in a chair or on the edge of the bed.
3. Remove the resident's shoes and socks/stockings.
4. Assist the resident as necessary in unbuttoning or unzipping his or her top.
5. If the resident is wearing a dress:
 - a. Ask her to stand.
 - b. Pull the dress and slip above the buttocks and ask her to return to sitting on the bed.
 - c. Pull the dress and slip over the resident's head. Slide the sleeves from the strong side first.
6. If the resident is wearing pants:
 - a. Ask him or her to stand (or lie back on the bed).
 - b. Assist the resident as necessary in unbuttoning and/or unzipping the slacks.
 - c. Slide the slacks below the buttocks.
 - d. If the resident is standing, ask him or her to sit on the edge of the bed.
 - e. Slide the slacks from the strong leg first.
7. Proceed with steps for assisting the resident with dressing (below), or if the resident is ready for bed and prefers to sleep in undergarments, help him or her into bed.
8. Place the call light within easy reach of the resident.
9. Discard all soiled clothing and linen into the soiled laundry container. Red bag as necessary.
10. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
11. Wash and dry your hands thoroughly.

Assisting the resident with dressing:

1. While dressing, support the resident from his or her weak side.
2. If the resident is lying down, assist him or her in putting on clean undergarments, socks/stockings and slacks while he or she is in a lying position.
3. Assist the resident to a sitting position. Allow the resident a moment to get used to sitting up.

continues on next page

4. Assist the resident with his or her shirt, blouse, dress, etc.
5. Assist the resident with putting on his or her shoes.
6. Assist the resident to his or her feet as necessary.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. If and how the resident participated in the procedure.
4. How the resident tolerated the procedure or any changes in the resident's ability to participate in the procedure.
5. Any problems or complaints made by the resident related to the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.2 (H5MAPR0114)

Ear Irrigation

Level III

Purpose

The purposes of this procedure are to soften and remove ear wax, to supply heat and relieve pain.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. The irrigation solution should not exceed 100°F (37.7°C).
2. Cotton packed tightly into the ear canal obstructs the flow of discharge.
3. Lying on the affected side after irrigation aids drainage by gravity.
4. Force of heat or cold on the eardrum can produce dizziness or nausea.
5. Should both ears require irrigation, wash and dry your hands thoroughly before irrigating each ear.
6. Do not force the procedure. Take your time and be gentle with the resident. Too forceful a flow may carry infections further into the auditory canal.

Equipment and Supplies

The following equipment and supplies are necessary when performing this procedure.

1. Sterile ear syringe;
2. Emesis basin;
3. Sterile basin for solution;
4. Solution (as prescribed);
5. Cotton balls;
6. Towel;
7. Plastic cape (optional); and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Put on gloves.
3. If the resident is sitting up, tilt his/her head backward slightly. Position yourself so the affected side is toward you.
4. If the resident is bedfast, position the resident's head on the edge of the pillow. Position yourself so the affected side is toward you.
5. Place the plastic protector where it will protect the resident and his/her bed linen.
6. Place the towel over the plastic protector.
7. Position the emesis basin against the cheek to catch the return flow.
8. Fill the syringe with warm solution.

continues on next page

9. Expel the air from the syringe.
10. Cleanse outer ear.
11. Grasp the auricle (flap of the ear). Pull upward and backward to straighten ear canal.
12. Place the tip of the syringe at ear opening. Direct the stream of fluid against the side of canal. Gentle pressure should be used.
13. Irrigate the ear. Observe for any unusual symptoms (i.e., dizziness, nausea, etc.).
14. If the resident complains of pain or discomfort, stop the procedure and notify the nurse.
15. Continue until all of the solution is used or until treatment is completed.
16. Observe the character of the return discharge.
17. Upon completion of the irrigation process, instruct the resident to turn his/her head to the affected side to allow all the fluid to drain.
18. Dry the external ear with a cotton ball. Use only one (1) cotton ball per wipe.
19. Discard used cotton balls into designated container.
20. Remove the towel and bed protector and discard into designated containers.
21. Pour the solution down the commode. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
22. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
23. Discard disposable equipment and supplies in designated containers.
24. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the ear was irrigated.
2. The name and title of the individual(s) who irrigated the ear.
3. The type of solution used to irrigate the ear.
4. All assessment data obtained concerning the resident’s ear.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Eye, Care of Artificial

Level II

Purpose

The purposes of this procedure are to prevent infection and to promote cleanliness when providing artificial eye care to residents.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Cleaning solution (water and/or prescribed solution) should not exceed 100°F (37.7°C).
2. If the resident is able, permit the resident to remove and replace the artificial eye.
3. **Do not use alcohol, ether, or acetone.** These may cause the plastic on the artificial eye to discolor and dim the luster of the eye.
4. If an eye cup is not available, use a clean denture cup.
5. Be sure the eye cup is clearly labeled with the resident's name and room number.
6. Be sure that gauze pads are in the eye cup to protect the eye when placing it in the cup.
7. If the artificial eye is washed in the resident's bathroom, fill the sink one-half full of lukewarm water to prevent breakage should the eye be accidentally dropped.
8. Handle the eye carefully to avoid scratching the eye.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Gauze;
2. Washcloths (2);
3. Clean cloth;
4. Mild soap;
5. Normal saline;
6. Bulb syringe, as necessary; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. If the resident is ambulatory, instruct the resident to lie down on his or her bed. Assist as necessary. (Note: Having the resident lie down may prevent accidental dropping of the artificial eye.)
3. Wash and dry your hands thoroughly.
4. Put on gloves.
5. Gently retract the lower eyelid with your thumb. (Note: Allow the resident to remove his/her own artificial eye, if possible.)

continues on next page

6. Apply gentle pressure below eyelid. If necessary use the bulb syringe to apply suction to the eye.
7. Carefully hold the artificial eye in the palm of your hand.
8. Wash the artificial eye with mild soap and water or plain normal saline by rubbing between the thumb and index finger.
9. Rinse the eye well under running tap water.
10. Dry the eye with a clean cloth.
11. If the resident does not desire to have the eye reinserted, store the eye in sterile saline or water in a plastic storage case lined with gauze. (Note: Be sure that the eye cup is clearly labeled with the resident's name and room number.)
12. Place the storage container in the bedside stand.
13. Retract the upper and lower eyelids with the thumb and index finger.
14. Wash eye socket with washcloth or gauze moistened with warm water or saline. (Note: Do not use soap to clean the socket because it may cause skin irritation.)
15. Dry socket well with gauze.
16. Wash eyelid margins with mild soap and water, wiping from inner to outer canthus. (Note: Use a clean section of the washcloth for each stroke.)
17. Dry eyelids by wiping from inner to outer canthus.
18. If the eye is to be replaced, dampen it in clean water. (Note: Allow the resident to replace the eye, if possible.)
19. Retract the resident's upper eyelid with the index finger or thumb of your nondominant hand.
20. With your dominant hand hold the eye so that the notched or pointed edge is positioned toward the nose.
21. Slide the eye up and under the eyelid as far as possible. Then, push down the lower lid to allow the eye to slip into place. (Note: Do not force the eye into the socket. Should you experience difficulty, summon the nurse supervisor.)
22. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
23. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
24. Discard disposable equipment and supplies in designated containers.
25. Discard washcloths in soiled laundry container.
26. Clean the overbed table and return it to its proper position.
27. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position **as indicated in the resident's plan of care**.
28. Reposition the bed covers. Make the resident comfortable.
29. Place the call light within easy reach of the resident.
30. Wash and dry your hands thoroughly.
31. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that artificial eye care was given.
2. The name and title of the individual(s) who assisted with the artificial eye care.
3. All assessment data obtained concerning the resident's eye.
4. The condition of the artificial eye and socket.
5. How the resident participated in the procedure.

continues on next page

6. How the resident tolerated the procedure or any changes in the resident's ability to tolerate or participate in the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the artificial eye care.
2. Notify the supervisor if the resident complains of pain or discomfort of the eye socket.
3. Report other information in accordance with facility policy and professional standards of practice.

Eye Compress, Cold

Level II

Purpose

The purposes of this procedure are to reduce inflammation and to promote comfort.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. If both eyes require treatment, wash and dry your hands thoroughly before treating each eye.
2. If discharge is present, or should both eyes require treatment, use a new compress for each application.
3. Change the eye compress when the eye compress is no longer cool.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Solution (as prescribed);
2. Gauze eye compresses;
3. Large basin (one-half full of ice);
4. Cotton balls;
5. Thumb forceps (2);
6. Sterile container (one-half full with prescribed solution); and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Put the sterile solution container into the basin of ice.
5. Allow the solution to cool.
6. Place the eye compress into the sterile container. Allow the compress to soak.
7. Using the thumb forceps, wring the eye compress as dry as possible.
8. Tell the resident that the compress is cold. Place the compress on the eyelid.
9. If the resident reports pain, stop the procedure and notify the nurse.
10. Change the compress after 5 minutes, or if the compress is no longer cool to the touch.
11. Discard used eye compresses into designated container.
12. When the last compress has been used, dry the eye from the nose to the outside of the eye with cotton balls. (Note: Use only one (1) cotton ball per wipe.)
13. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.

continues on next page

14. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
15. Discard disposable equipment and supplies in designated containers.
16. Clean the overbed table and return it to its proper position.
17. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident’s plan of care.
18. Reposition the bed covers. Make the resident comfortable.
19. Place the call light within easy reach of the resident.
20. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the cold compress was applied.
2. The name and title of the individual(s) who applied the cold compress.
3. The type of solution used to treat the eye.
4. All assessment data obtained concerning the resident’s eye.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Eye Compress, Hot

Level II

Purpose

The purposes of this procedure are to improve circulation, reduce inflammation and promote comfort.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Wash and dry your hands before and after treating each eye.
2. Use a new compress for each application.
3. Hot compress solution should not exceed 110°F (43.3°C), unless otherwise ordered.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Lubricant;
2. Solution (as prescribed);
3. Gauze eye compresses;
4. Emesis basin;
5. Cotton balls;
6. Thumb forceps (2);
7. Bath thermometer;
8. Sterile container; and
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Put on gloves.
3. If the resident is sitting up, turn his/her head slightly toward the affected side.
4. If the resident is bedfast, position the resident's head on the pillow and turn the head slightly toward the affected side.
5. Apply the lubricant to area in which the compress is to be applied.
6. Pour heated solution in sterile container.
7. Check temperature with the bath thermometer.
8. Place the eye compress into the sterile container. Allow the compress to soak.
9. Using the thumb forceps, wring the eye compress as dry as possible.
10. Place the compress on the eye.
11. If pain is experienced, cease the procedure and notify the nurse.

continues on next page

12. Change the compress when the heat is lost. Unless otherwise ordered, continue the treatment for five (5) minutes.
13. When the last compress has been used, dry the eye from the nose to the outside of the eye with cotton balls. (Note: Use only one (1) cotton ball per wipe.)
14. Discard used cotton balls into designated container.
15. Apply clean or sterile eye dressing as ordered.
16. Remove gloves and discard into designated container.
17. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the cold compress was applied.
2. The name and title of the individual(s) who applied the cold compress.
3. The type of solution used to treat the eye.
4. All assessment data obtained concerning the resident’s eye.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Eye Irrigation

Level III

Purpose

The purposes of this procedure are to remove irritants, moisten, soothe, and disinfect the eye.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Irrigation solution should not exceed 100°F (37.7°C). Using a cold solution will intensify pain. Use lukewarm solutions unless otherwise instructed.
2. The cornea has many nerves and is very sensitive. Do not use pressure when irrigating the eye. Allow the solution to flow in a steady stream.
3. Wash and dry your hands before and after irrigating each eye.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Sterile irrigating syringe;
2. Emesis basin;
3. Small basin for solution;
4. Solution (as prescribed);
5. Sterile 4x4 gauze pads;
6. Cotton balls;
7. Towel;
8. Plastic cape (optional);
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed); and
10. Other as may be necessary or appropriate.

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Put on gloves.
3. Fill the irrigating syringe with solution and set aside.
4. If the resident is sitting up, tilt his/her head backward slightly.
5. If the resident is bedfast, position the resident's head on the edge of the pillow.
6. Position yourself so the affected side is toward you.
7. Place the plastic protector where it will protect the resident and his/her bed linen.
8. Place the towel over the plastic protector.
9. Cover the opposite eye with a sterile pad.
10. Position the emesis basin against the cheek to catch the return flow.

continues on next page

11. Remove any encrustations from the eyelids with moist sterile cotton balls. Wipe from the nose to the outside of the eye. Use only one (1) cotton ball per wipe.
12. Separate the eyelids with the thumb and index finger.
13. Using the filled irrigation syringe, irrigate the eye by allowing the fluid to flow in a steady stream. Irrigate from the nose to the outside of the eye to avoid contamination of the opposite eye. Do not touch the eye or eyelid with the syringe.
14. Be sure the solution is draining into the emesis basin.
15. Observe the character of the return flow.
16. Irrigate the eye until the solution has been used.
17. Dry the eye from the nose to the outside of the eye with the sterile pad.
18. Remove the sterile pad from the opposite eye. Discard the gauze pad.
19. Remove the towel and bed protector and discard.
20. Pour the solution down the commode.
21. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the eye was irrigated.
2. The name and title of the individual(s) who irrigated the eye.
3. The type of solution used to irrigate the eye.
4. All assessment data obtained concerning the resident’s eye.
5. How the resident tolerated the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice

Fingernails/Toenails, Care of

Level II

Purpose

The purposes of this procedure are to clean the nail bed, to keep nails trimmed, and to prevent infections.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Nail care includes daily cleaning and regular trimming.
2. Proper nail care can aid in the prevention of skin problems around the nail bed.
3. Unless otherwise permitted, do not trim the nails of diabetic residents or residents with circulatory impairments.
4. Trimmed and smooth nails prevent the resident from accidentally scratching and injuring his or her skin.
5. Watch for and report any changes in the color of the skin around the nail bed, blueness of the nails, any signs of poor circulation, cracking of the skin between the toes, any swelling, bleeding, etc.
6. Stop and report to the nurse supervisor if there is evidence of ingrown nails, infections, pain, or if nails are too hard or too thick to cut with ease.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Nail clippers;
2. Nail file or emery board;
3. Towel;
4. Rinse basin with clear, warm water;
5. Wash basin one-half full of warm soapy water;
6. Orange sticks;
7. Linen protector (disposable or plastic), as necessary;
8. Hand lotion (as permitted or prescribed);
9. Paper towels; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half full of warm soapy water.
4. Allow the first hand or foot to soak in the warm soapy water for approximately five (5) minutes. Encourage the resident to exercise his or her fingers or toes while they are soaking.

continues on next page

5. If the wash basin is to be placed on the bed, place the linen protector under the wash basin to protect the linen and to keep the resident dry.
6. Rinse the hand or foot that has been in the soapy water with clear, warm water.
7. Dry the hand or foot with the towel.
8. Place the towel under the resident's dried hand or foot.
9. Place the second hand or foot in the soak basin.
10. Gently, remove the dirt from around and under each nail with an orange stick.
11. Wipe the dirt from the orange stick with a paper towel. Discard the paper towel into the trash receptacle.
12. Do not trim nails below the skin line or cut the skin.
13. Trim fingernails in an oval shape and toenails straight across.
14. Smooth the nails with a nail file or emery board. Apply lotion as permitted.
15. Repeat the procedure for the second hand or foot.
16. If the resident becomes tired, weak, or faint during the procedure, cease the procedure and summon the nurse supervisor by using the call system.
17. When the nails have been trimmed, remove the wash basin. Empty the water into the commode.
18. Discard disposable equipment and supplies in designated containers.
19. Remove the towel and discard into the soiled laundry container.
20. Clean reusable equipment and supplies and return to designated storage areas.
21. Clean the overbed table and return it to its proper position.
22. Lower the bed into lowest position and place the side rails and the head of the bed in the appropriate position as indicated in the resident's plan of care.
23. Reposition the bed covers. Make the resident comfortable.
24. Place the call light within easy reach of the resident.
25. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that nail care was given.
2. The name and title of the individual(s) who administered the nail care.
3. The condition of the resident's nails and nail bed, including:
 - a. Redness or irritation of skin of hands and feet;
 - b. Breaks or cracks in skin, especially between toes;
 - c. Pale, bluish, or gray discoloration of feet;
 - d. Bluish or dark color of nail beds;
 - e. Corns or calluses;
 - f. Ingrown nails;
 - g. Bleeding; and/or
 - h. Pain.
4. Any difficulties in cutting the resident's nails.
5. Any problems or complaints made by the resident with his/her hands or feet or any complaints related to the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Hearing Aid, Care of

Level II

Purpose

The purpose of this procedure is to maintain the resident's hearing at the highest attainable level.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

General Guidelines

Checking the Batteries:

1. If the hearing aid is not functioning properly, check the battery. Make sure it is the proper size for the device.
2. To test the battery:
 - a. Place the control switch in the ON position.
 - b. Turn the volume control UP.
 - c. Cup your hand over the hearing aid. You should now be able to hear a whistle sound. If not, change the batteries.

Placement of the Hearing Aid:

1. Turn the hearing aid off and the volume all the way down before placing the hearing aid into the ear.
2. The hearing aid should fit securely, but comfortably, into the ear.
3. After the hearing aid is in place turn it on and adjust the volume until the resident reports that he or she can hear sufficiently.
4. If the resident complains of an unpleasant squeal or whistle sound, check the placement in the ear and check for any breaks or cracks in the hearing device.

Care of the Hearing Aid:

1. Never clean or immerse any part of a hearing aid (other than the ear mold) in water. The device must be returned to the dealer or to an audiologist to be cleaned properly.
2. Handle the hearing aid carefully. Dropping the hearing aid can damage the unit.
3. Do not expose a hearing aid to heat, moisture or aerosol vapors.

Storage of the Hearing Aid:

1. Turn the hearing aid OFF when not in use.
2. Remove the battery from the battery case when the unit is not in use. Leave the case open.
3. Be sure that the hearing container is clearly labeled with the resident's name and room number.

Miscellaneous:

1. Assess the resident's knowledge of operating the hearing aid.
2. Explain the controls and adjustments to the resident and his or her family members.
3. Be sure that spare batteries are available.
4. Even though a resident is wearing a hearing aid, he or she may still not hear well. Face the resident when speaking to him or her.
5. Report complaints to the nurse supervisor.

continues on next page

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the hearing aid was checked and/or battery was replaced.
2. The name and title of the individual(s) who checked the hearing aid and changed the battery.
3. If the resident refused the procedure, the reason(s) why and the intervention taken.
4. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if hearing aid is damaged or needs to be sent to the dealer for cleaning.
2. Notify the supervisor if the resident complains of problems related to hearing and/or the hearing aid or has a wax build up in the ear.
3. Report other information in accordance with facility policy and professional standards of practice.

Mouth Care

Level II

Purpose

The purposes of this procedure are to keep the resident's lips and oral tissues moist, to cleanse and freshen the resident's mouth, and to prevent oral infection.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Toothbrush (soft bristles);
2. Toothpaste;
3. Emesis basin;
4. Towel;
5. Fresh water;
6. Mouthwash, if permitted;
7. Disposable cup;
8. Straw (flexible);
9. Tongue depressor;*
10. Applicators or gauze sponges;*
11. Lubricants (petroleum jelly, etc.);* and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

*These items are available in a disposable mouth care kit.

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Allow the resident who is able to provide his/her own mouth care to do so.
5. Gently turn the resident's head toward you.
6. Spread the towel under the resident's chin and across the pillow to protect the resident's clothing and/or bed covers.
7. Position the emesis basin on the towel under the resident's chin.
8. Gently open the resident's mouth. (Place one hand on the chin and gently press downward.)
9. Hold the tongue in place with the tongue depressor.
10. With your free hand, moisten the applicators with the mouthwash solution.
11. Insert the applicator into the resident's mouth.

continues on next page

12. Thoroughly wipe the roof of the resident's mouth, inside the cheeks, the tongue, and the teeth with the applicator. (**Note:** Change the applicator frequently.)
13. Place all used applicators into the emesis basin.
14. Rinse the resident's mouth by using fresh water on the applicators.
15. Dry the resident's face and chin area. Remove the towel.
16. Moisten the inside of the resident's mouth, tongue and lips. Use a prepared swab or a water soluble lubricant.
17. Remove gloves and discard into designated container. Wash your hands.
18. Clean your equipment and return it to its designated storage area.
19. Discard disposable equipment and supplies in designated containers.
20. Discard towels in soiled laundry container.
21. Clean the overbed table and return it to its proper position.
22. Reposition the bed covers. Make the resident comfortable.
23. Place the call light within easy reach of the resident.
24. Wash and dry your hands thoroughly.
25. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the mouth care was provided. The name and title of the individual(s) who provided the mouth care. All assessment data obtained concerning the resident's mouth. The certified nursing assistant should report to the licensed nurse to record in the medical record.
2. Complaints of pain or discomfort of mouth. The certified nursing assistant should report to the licensed nurse to record in the medical record.
3. If the resident refused the treatment, the reason(s) why and the intervention taken.
4. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the mouth care.
2. Report other information in accordance with facility policy and professional standards of practice.

Perineal Care

Level II

Purpose

The purposes of this procedure are to provide cleanliness and comfort to the resident, to prevent infections and skin irritation, and to observe the resident's skin condition.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Wash basin;
2. Towels;
3. Washcloth;
4. Soap (or other authorized cleansing agent); and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. Fold the bedspread or blanket toward the foot of the bed.
5. Fold the sheet down to the lower part of the body. Cover the upper torso with a sheet.
6. Raise the gown or lower the pajamas. Avoid unnecessary exposure of the resident's body.
7. Put on gloves.
8. Ask the resident to bend his or her knees and put his or her feet flat on the mattress. Assist as necessary.

For a female resident:

- a. Wet washcloth and apply soap or skin cleansing agent.
- b. Wash perineal area, wiping from front to back.
 - (1) Separate labia and wash area downward from front to back. (Note: If the resident has an indwelling catheter, gently wash the juncture of the tubing from the urethra down the catheter about 3 inches. Gently rinse and dry the area.)
 - (2) Continue to wash the perineum moving from inside outward to the thighs. Rinse perineum thoroughly in same direction, using fresh water and a clean washcloth.
 - (3) If the resident has an indwelling catheter, hold the tubing to one side and support the tubing against the leg to avoid traction or unnecessary movement of the catheter.
 - (4) Gently dry perineum.
- c. Ask the resident to turn on her side with her top leg slightly bent, if able.
- d. Rinse wash cloth and apply soap or skin cleansing agent.

continues on next page

- e. Wash the rectal area thoroughly, wiping from the base of the labia towards and extending over the buttocks.
- f. Rinse and dry thoroughly.

For a male resident:

- a. Wet washcloth and apply soap or skin cleansing agent.
 - b. Wash perineal area starting with urethra and working outward.
 - c. If the resident has an indwelling catheter, gently wash the juncture of the tubing from the urethra down the catheter about 3 inches. Gently rinse and dry the area.
 - d. Retract foreskin of the uncircumcised male.
 - e. Wash and rinse urethral area using a circular motion.
 - f. Continue to wash the perineal area including the penis, scrotum and inner thighs.
 - g. Thoroughly rinse perineal area in same order, using fresh water and clean washcloth.
 - h. If the resident has an indwelling catheter, hold the tubing to one side and support the tubing against the leg to avoid traction or unnecessary movement of the catheter.
 - i. Gently dry perineum following same sequence.
 - j. Reposition foreskin of uncircumcised male.
 - k. Ask the resident to turn on his side with his upper leg slightly bent, if able.
 - l. Rinse washcloth and apply soap or skin cleansing agent.
 - m. Wash and rinse the rectal area thoroughly, including the area under the scrotum, the anus, and the buttocks.
 - n. Dry area thoroughly.
9. Discard disposable items into designated containers.
 10. Remove gloves and discard into designated container.
 11. Wash and dry your hands thoroughly.
 12. Reposition the bed covers. Make the resident comfortable.
 13. Place the call light within easy reach of the resident.
 14. Clean wash basin and return to designated storage area.
 15. Clean the bedside stand.
 16. Wash and dry your hands thoroughly.

Documentation

1. The date and time that perineal care was given.
2. The name and title of the individual(s) giving the perineal care.
3. Any discharge, odor, bleeding, skin care problems or irritation, complaints of pain or discomfort.
4. Any problems noted at the catheter-urethral junction during perineal care such as drainage, redness, bleeding, irritation, crusting, or pain.
5. How the resident tolerated the procedure or any changes in the resident's ability to participate in the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the perineal care.
2. Report other information in accordance with facility policy and professional standards of practice.

Prosthesis (Artificial Limb), Care of

Level II

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

When providing care to the resident with a prosthesis, follow these guidelines:

1. If the amputation was recent and the resident is still adjusting to the prosthesis, carefully follow all instructions from the prosthetist.
2. Be sure that the prosthesis is clean in order to prevent skin problems.
3. Wash, rinse and dry the socket of the prosthesis every day according to manufacturer's instructions.
4. Keep lint and dirt from accumulating in the joints of the prosthesis.
5. Follow manufacturer's guidelines for any special care of the prosthesis (i.e., oiling, etc.).
6. Inspect the prosthesis for loose or worn parts at least once each week. Report such findings to the staff/charge nurse.
7. Report any changes, problems or complaints the resident has concerning the fitting of the prosthesis.
8. Wear personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).
9. Wash the residual limb daily with soap and water.
10. Thoroughly rinse soap and water from the limb. Allow it to dry completely before donning the prosthesis.
11. Avoid using any creams, ointments, or preparations that contain alcohol.
12. Do not soak or shave the limb.
13. If applying a limb sock, be sure that it is free of wrinkles and that it fits well.
14. If a sock is used, make sure it is cleaned daily with cool water and mild soap. It should be completely dry before reusing.
15. Do not pad the limb or prosthesis with cotton, towels, washcloths, etc. Any uneven distribution of pressure could cause pressure sores and infection.
16. Inspect the skin of the residual limb daily. Report redness, pressure points, blisters, irritation or abrasions.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the procedure was performed.
2. The name and title of the individual(s) who provided the care.
3. If the resident refused the procedure, the reason(s) why and the intervention taken.
4. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Shampooing Hair

Purpose

The purpose of this procedure is to clean the resident's hair and scalp.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Chair;
2. Basin of warm water;
3. Pitcher of water;
4. Shampoo;
5. Resident's personal hair care products;
6. Large basin or pail;
7. Bed protector (plastic or disposable);
8. Waterproof trough (shampoo tray or plastic sheet);
9. Pillow (waterproof case or plastic cover);
10. Bath towels (3);
11. Wash cloth;
12. Cup (plastic, paper, or styrofoam);
13. Bath blanket;
14. Hand towels;
15. Cotton balls;
16. Hair dryer (as permitted); and
17. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.

Shampooing a resident's hair during a shower or tub bath:

1. If able, have the resident tip his or her head backward. Support the resident's neck with one hand while shampooing. Use a washcloth folded across the resident's eyes, if tolerated by the resident.
2. If the resident is unable to tilt head back, ask him or her to lean forward and hold a wash cloth over the eyes to keep soap out.
3. Adjust water to a comfortably warm temperature. Test water temperature on wrist or forearm.
4. Direct a stream of comfortably warm water on the resident's hair while holding the sprayer close to the scalp and away from the resident's face.

continues on next page

5. Apply selected shampoo and lather. Using both hands, gently wash the hair and massage the scalp with fingertips (not fingernails).
6. Rinse hair thoroughly.
7. Use resident's personal hair care products as requested.

Shampooing a bedfast resident's hair:

1. Adjust the bed to a comfortable position.
2. Place the chair at the head of the bed. The chair should be lower than the mattress with the seat touching the mattress.
3. Place the small hand towel on the chair.
4. Place the large basin or pail on the towel.
5. Unless otherwise instructed, put small amounts of cotton in the resident's ears.
6. Assist the resident in a position so that his or her head will be close to where you will be standing.
7. Remove the pillow from under the resident's head, cover and Place the pillow under the small of the resident's back so that his or her head will be tilted back.
8. Place the bath blanket over the resident without exposing the resident.
9. Place the disposable or plastic bed protector on the mattress under the resident's head.
10. If a shampoo trough is used, place it under the resident's head.
11. If a shampoo trough is not used, make a trough from the plastic bed protector by:
 - a. Rolling each side of the plastic sheet three (3) times;
 - b. Place one end of the channel under the resident's head; and
 - c. Hang the opposite end off the bed into the large basin or pail.
12. Loosen the resident's gown or pajama top. Turn the neckband under.
13. Fill the small basin with warm water and place on the bedside stand or overbed table.
14. Place the cup beside the basin of water.
15. Fill the pitcher with warm water and place within easy reach.
16. Place a wash cloth over the resident's eyes for protection.
17. Comb the resident's hair to remove tangles.
18. Fill the cup with warm water from the basin. Pour it over the resident's hair. Repeat this procedure until the hair is completely wet.
19. Apply a small amount of shampoo to the hair.
20. Using both hands, gently wash the hair and massage the scalp with fingers (not fingernails).
21. Rinse the shampoo from the hair by pouring water from the cup. Be sure the hair is completely rinsed of all shampoo. Be sure the water is draining into the large basin or pail in the chair.
22. Use resident's personal hair care products as appropriate.
23. Dry the resident's forehead and ears with the towel.
24. Remove the cotton from the resident's ears. Discard used cotton into designated containers.
25. Raise the resident's head and wrap his or her head with a bath towel.
26. Rub the resident's hair with the bath towel to dry it as much as possible. Leave the towel on the resident's head.
27. Take the large basin or pail of water from the chair into the bathroom. Pour the contents down the commode. Flush the commode.
28. Pour any remaining water down the sink. Rinse the sink.

continues on next page

29. Remove the bed or pillow protectors and shampoo trough from the bed. (Note: If reusable, place them into the large basin or pail.)
30. Remove the towel from the resident's head. If permitted, use a hair dryer to dry and style the resident's hair.

If using a portable hair dryer:

1. Be sure the dryer is set on low.
2. Hold the dryer 8 to 10 inches from the resident's head.
3. Keep the dryer moving.
4. Direct the air-flow to the resident's hair—not the scalp.
5. Do not place a hair dryer in a resident's lap.

After shampooing:

1. Comb and style the resident's hair.
2. Change the resident's gown as needed.
3. Remove the bath blanket and cover the resident with his or her bed linen.
4. Help the resident to a comfortable position.
5. Lower the bed and place the siderails and the head of the bed in the position as indicated in the plan of care.
6. Place the call light within easy reach of the resident.
7. Discard disposable equipment and supplies in designated containers.
8. Discard soiled laundry and linen into soiled laundry container.
9. Clean equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
10. Clean the overbed table and return it to its proper position.
11. Position the chair in its proper place.
12. Wash and dry your hands thoroughly.

Documentation

1. The date and time the resident's hair was shampooed.
2. The name and title of the individual(s) who shampooed the resident's hair.
3. The condition of the resident's scalp (i.e., any redness, scaling, sores, etc.).
4. Any problems or complaints made by the resident related to the hair care.
5. If the resident refused the care, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Shaving the Resident

Purpose

The purpose of this procedure is to promote cleanliness and to provide skin care.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Wash basin or warm water (115°F);
2. Razor (electric or disposable);
3. Shaving cream or lotion;
4. After-shave lotion or powder (as permitted);
5. Towel and washcloth;
6. Mirror; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. Put on gloves.

If using a safety or disposable razor:

1. Fill the basin one-half full of warm water (115°F). Take it to the resident's bedside and place it on the bedside stand or overbed table.
2. If the resident can sit up, raise the head of the bed.
3. If the resident is wearing eyeglasses, ask him to remove them. Place them on the bedside stand or overbed table.
4. If the resident is a denture wearer, encourage the resident to wear them. This will aid in shaving the resident.
5. Spread the towel under the resident's chin.
6. Soak the washcloth in the water. Dampen the resident's face with the washcloth to aid in softening the beard.
7. Apply the shaving cream. Use a generous amount, as this will eliminate razor cuts, hair pulling, and skin irritation.
8. Begin at the sideburns and work downward over the cheek, chin, lips and nose. Keep the skin tight as you shave. Rinse the razor after each stroke.
9. Use an upward stroke under the chin and jaws. Keep the skin tight. Rinse the razor often.

continues on next page

10. Once you have completely shaved the resident, rinse the shaving cream from the resident’s face. Dry the face and remove the towel from under the resident’s chin.
11. Dispose of the razor in a designated sharps container.
12. If there is a sharps container designated “For Disposable Razors Only” and that container is outside the resident’s room, the razor must be transported to this destination in a puncture-resistant, closed, and marked container.

If using an electric razor:

1. Apply pre-shave lotion if desired.
2. Plug the razor in and turn to “on.” (Note: Do not use an electric razor if the resident is using oxygen.)
3. Shave the cheek areas first, then around the mouth, and down the neck last. Encourage the resident to draw skin taut or pull skin taut with free hand. Have the resident tilt head back while shaving neck, if able.
 - a. For a razor with flat or flexible head, use short up-and-down motion with the grain of beard.
 - b. For a razor with circular head, use small, circular motions.
4. Apply after-shave lotion or powder as permitted.
5. Reposition the bed covers. Make the resident comfortable.
6. Place the call light within easy reach of the resident.
7. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
8. Remove gloves. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time that the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. If and how the resident participated in the procedure or any changes in the resident’s ability to participate in the procedure.
4. Any problems or complaints made by the resident related to the procedure.
5. If the resident refused the treatment, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Teeth, Brushing

Purpose

The purpose of this procedure is to assist the resident with oral hygiene.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Toothbrush (soft bristles);
2. Toothpaste;
3. Emesis basin;
4. Towel;
5. Fresh water;
6. Mouthwash, if permitted;
7. Disposable cup;
8. Straw (flexible);
9. Dental floss (unwaxed), as needed; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Unless otherwise indicated, assist the resident to a sitting position.
4. Put on gloves.
5. Spread the towel under the resident's chin and across the chest to protect the resident's clothing and/or bed covers.
6. Pour water or mouthwash in a disposable cup.
7. Instruct the resident to take a small amount of the solution into his or her mouth. Use a straw if necessary. Instruct the resident to swish the solution around in his or her mouth and spit into the emesis basin.
8. Moisten the toothbrush with fresh water or with the mouthwash solution and apply toothpaste.
9. If the resident cannot independently brush his or her teeth:
 - a. Ask the resident to open his or her mouth.
 - b. Place the toothbrush at the gumline (45° angle) with the bristles pointed toward the gums.
 - c. Brush the teeth gently downward from the gumline for the top teeth, and upward from the gums on the bottom teeth.
10. Allow the resident to take small amounts of water, or mouthwash from time to time to rinse his or her mouth. Ask the resident to floss. Assist as necessary.

continues on next page

11. Ask the resident to rinse again.
12. Instruct the resident to spit the rinse solution into the emesis basin.
13. Dry the resident’s face and chin area. Remove the towel.
14. Remove gloves and discard into designated container. Wash your hands.
15. Clean your equipment and return it to its designated storage area (i.e., bedside stand, bathroom, etc.).
16. Discard disposable equipment and supplies in designated containers.
17. Discard towels in soiled laundry container.
18. Clean the overbed table and return it to its proper position.
19. Lower the bed into lowest position and place the siderails and the head of the bed in the appropriate position as indicated in the resident’s plan of care.
20. Reposition the bed covers. Make the resident comfortable.
21. Place the call light within easy reach of the resident.
22. Wash and dry your hands thoroughly.
23. If the resident desires, return the door and curtains to the open position and if visitors are waiting tell them they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the resident’s teeth were brushed. Indicate a.m. or p.m. on the ADL record.
2. The name and title of the individual(s) who assisted brushing the resident’s teeth. Initial in the appropriate area on the ADL record.
3. All assessment data obtained concerning the resident’s mouth. The certified nursing assistant should report to the licensed nurse to record in the medical record.
4. Any complaints of pain or discomfort of mouth. If the resident refused the treatment, the reason(s) why and the intervention taken.
5. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Accidents/Incidents (Employee)

Policy Statement

Our facility shall provide a safe and secure environment for staff and residents. Therefore, all accidents or incidents occurring on facility premises or to facility employees while performing their jobs shall be reported and investigated.

Policy Interpretation and Implementation

Reporting Accidents/Incidents:

1. For reporting purposes, an “accident/incident” is defined as the occurrence of injury, illness, fire, explosion, water damage, altercation, etc., or any similar event that results in personal injury or illness to a resident, employee, or visitor or in damage to the building, equipment, or property of this facility.
2. An employee who witnesses an accident/incident involving a resident, employee, or visitor or who is involved in an accident/incident shall report the accident/incident to his/her immediate supervisor as soon as practicable. However, an employee shall not leave an accident victim unattended unless it is absolutely necessary in order to summon assistance.
3. Supervisors shall report any accident/incident involving a resident, employee, or visitor to the director of the department in which the accident/incident occurred as soon as practicable.
4. Staff who witness an accident/incident shall report it to the nursing supervisor as soon as practicable after the occurrence so that he/she can ensure that an appropriate assessment occurs and that medical attention is obtained, as needed.

Assisting Accident Victims:

1. Staff who witness an accident or find it necessary to aid an accident victim should follow first-aid procedures and summon help as needed to evaluate and manage the situation.

Medical Attention:

1. The nurse supervisor and/or charge nurse shall:
 - a. examine all accident/incident victims;
 - b. notify a resident’s attending physician about the accident or incident; and
 - c. If necessary, obtain an order to transfer the injured person to the emergency room or medical treatment center.

Investigation and Reporting:

1. The nurse supervisor and/or department director shall conduct an immediate investigation of the accident/incident and use information obtained during the investigation to complete a *Report of Incident/Accident* form.
2. A *Report of Incident/Accident* form shall be completed and submitted to the business office within 24 hours of the occurrence of the accident/incident.

continues on next page

3. The following data, as it may apply, shall be included on the *Report of Incident/Accident* form:
 - a. The date and time the accident/incident occurred;
 - b. The nature of the injury or illness (e.g., needlestick, bruise, fall, nausea, etc.);
 - c. The circumstances surrounding the accident/incident;
 - d. Where the accident/incident occurred;
 - e. Name(s) of any witnesses and their account of the accident/incident;
 - f. The injured person’s account of the accident/incident;
 - g. The time the injured person’s attending or personal physician was notified as well as the time the physician responded and his/her instructions;
 - h. The date and time the injured person’s family was notified and by whom;
 - i. The condition of the injured person, to include his/her vital signs;
 - j. Disposition of the injured person (i.e., transferred to hospital, put to bed, sent home, returned to work, etc.);
 - k. Corrective action taken;
 - l. Follow-up information;
 - m. Other pertinent data as necessary or required; and
 - n. Signature and title of the person completing the report.
4. The *Report of Incident/Accident* form shall be submitted to the director of nursing services no later than 24 hours after the occurrence of the accident/incident.

Background Screening Investigations

Policy Statement

Our facility conducts employment background screening checks, reference checks and criminal conviction investigation checks on all applicants for positions with direct access to residents (“direct access employees”).

Policy Interpretation and Implementation

1. For purposes of this policy “direct access employee” means any individual who has access to a resident or patient of a long term care (LTC) facility or provider through employment or through a contract and has duties that involve (or may involve) one-on-one contact with a patient or resident of the facility or provider, as determined by the state for purposes of the national background check program.
2. The director of personnel, or designee, conducts background checks, reference checks and criminal conviction checks (including fingerprinting as may be required by state law) on all potential direct access employees and contractors. Background and criminal checks are initiated within two days of an offer of employment or contract agreement, and completed prior to employment.
3. For any individual applying for a position as a certified nursing assistant, the state nurse aide registry is contacted to determine if any findings of abuse, neglect, mistreatment of individuals, and/or theft of property have been entered into the applicant’s file.
4. For any licensed professional applying for a position that may involve direct contact with residents, his/her respective licensing board is contacted to determine if any sanctions have been assessed against the applicant’s license.
5. Should the background investigation disclose any misrepresentation on the application form or information indicating that the individual has been convicted of abuse, neglect, mistreatment of individuals, and/or misappropriation of property, the applicant is not employed or contracted.
6. Any information (e.g., court actions) discovered through the course of the background investigation that indicates that the applicant is unfit for employment in a nursing home (for example, convictions involving child abuse, sexual assault, theft, assault with a deadly weapon, etc.) is reported to the individual’s appropriate licensing boards.

Credentialing of Nursing Service Personnel

Policy Statement

Nursing service personnel who require a license or certification to provide resident care or treatment without direction or supervision within the scope of the individual's license or certification must present verification of such license or certification prior to or upon employment.

Policy Interpretation and Implementation

1. Nursing personnel who require a license or certification to perform resident care or treatment without direction or supervision must present verification of such license/certification to the director of nursing services prior to or upon employment.
2. Nursing personnel requiring a license/certification are not permitted to perform direct resident care services until all licensing/background checks have been completed.
3. Upon obtaining the applicants informed consent to conducting a license/certification/background investigation, the director of nursing services, or designee, will:
 - a. contact the appropriate state licensing board(s) to obtain a letter of verification/computer printout of such license/certification;
 - b. contact appropriate schools/universities to obtain written verification of the individual's relevant education background;
 - c. contact previous employers to obtain written/oral verification of previous work experience and qualifications; and
 - d. contact the facility's authorized vendor/service organization to perform a background check in accordance with current state law and facility policy.
4. A copy of all documents obtained during the verification and background check are filed in the employee's personnel file. Such records are filed in accordance with current federal and state law and facility policy to protect the confidentiality of information.
5. Should the investigation reveal inconsistencies in information obtained and information provided by the applicant that would prevent the applicant's further employment, the director of nursing services, or designee, will provide the applicant with a copy of such information and the name of the agency providing such report(s).
6. Should the investigation reveal the applicant does not hold a valid license or certification, appropriate state licensing boards and authorities will be notified of the applicant's attempt to practice without a license/certification.
7. Employment investigations are conducted in accordance with current federal and state laws governing such actions. Violations of this policy must be reported to the administrator immediately.
8. A copy of annual license renewals/certifications (as applicable) must be presented to the director of nursing services no later than February 1st of each year.
9. Inquiries concerning credentialing should be referred to the administrator or to the director of nursing services.

Daily Work Assignments

Policy Statement

All nursing service personnel shall follow daily work assignments and perform assigned duties in accordance with professional standards of practice and facility policy.

Policy Interpretation and Implementation

1. Work assignments are prepared from the residents' care plan by the nurse supervisor/charge nurse.
2. Certified nursing assistants (CNAs) and trainees are expected to carry out their daily assignments in a professional manner and in accordance with established nursing procedures.
3. Trainees must work under the supervision of a CNA, licensed nurse, or instructor and may only perform duties in accordance with the facility's nurse aide training program guidelines governing the use of trainees.
4. Paid feeding assistants are under the supervision of the nurse on the unit in which the feeding assistant is working.
5. All licensed nursing personnel and other support staff must perform all assigned duties in accordance with their respective job description and facility policy.
6. Changes in work assignments may not be made for personal reasons. Changes in work assignments must be approved by the nurse supervisor/charge nurse.

Department Duty Hours, Nursing Services

Policy Statement

Our facility has developed and assigned duty hours for the nursing services department.

Policy Interpretation and Implementation

1. Nursing service is provided twenty-four (24) hours per day, seven days per week. Our department's duty hours are:

Shift	Work Hours	
First Shift	From:	To:
Second Shift	From:	To:
Third Shift	From:	To:

2. Staggered work hours may be assigned by the director of nursing services when necessary.

Position/Title	Staggered Hours		Reason
	From:	To:	
	From:	To:	

3. Departmental work schedules may be revised by the director of nursing services when deemed necessary and appropriate to ensure that each resident's needs are met.
4. Insofar as practical, nursing personnel will be informed of changes in their work schedule at least twenty-four (24) hours in advance of the change.
5. Department personnel are expected and required to work their scheduled shifts. Failure to report to work as scheduled may result in disciplinary action.
6. Exchanging of work assignments/schedules among the nursing staff must be approved by the director of nursing services, or his/her designee, prior to such exchange taking place.
7. Staff making the exchange is responsible for working the assigned schedule. Failure to do so may result in disciplinary action.

Departmental Supervision

Policy Statement

The nursing services department shall be under the direct supervision of a registered or licensed practical/vocational nurse at all times.

Policy Interpretation and Implementation

1. A registered or licensed practical/vocational nurse (RN/LPN/LVN) is on duty twenty-four hours per day, seven (7) days per week, to supervise the nursing services activities in accordance with physician orders and facility policy.
2. A registered nurse (RN) is employed as the director of nursing services (DNS). The DNS is on duty during the day shift Monday through Friday. During the absence of the DNS, a nurse supervisor/charge nurse is responsible for the supervision of all nursing department activities including the supervision of direct care staff.
3. The nurse supervisors/charge nurses are registered nurses (RN), or licensed practical (vocational) nurses (LPN/LVN), and are duly licensed by this state.
4. The director of nursing services and/or the nurse supervisor/charge nurse, as a minimum, is responsible for:
 - a. making daily resident visits to observe and evaluate the resident's physical and emotional status;
 - b. reviewing medication cards for completeness of information, accuracy in the transcription of physician orders, and adherence to stop order policies;
 - c. reviewing individual resident care plans for appropriate goals, problems, approaches, and revisions based on nursing needs;
 - d. assuring that the resident's plan of care is being followed;
 - e. arranging schedule to allow time for supervision and evaluation of performance of nursing personnel and paid feeding assistants;
 - f. informing attending physicians and resident families of changes in the resident's medical condition;
 - g. charting and documenting medical records as necessary;
 - h. keeping nursing service personnel informed of status of residents and other related matters through written reports and verbal communication;
 - i. assigning work schedules and staffing to meet the needs of residents;
 - j. providing direct resident care as necessary or appropriate; and
 - k. other tasks and functions that may become necessary.
5. Job descriptions for all nursing service personnel are on file in the business office and office of the director of nursing services.

Director of Nursing Services

Policy Statement

The nursing services department is under the direct supervision of a registered nurse.

Policy Interpretation and Implementation

1. The nursing services department is managed by the director of nursing services. The director is a registered nurse (RN), licensed by this state, and has experience in nursing service administration, rehabilitative and geriatric nursing.
2. The director is employed full-time (40-hours per week) and is responsible for, but is not necessarily limited to:
 - a. developing and periodically updating the nursing service objectives and statements of philosophy;
 - b. developing standards of nursing practice;
 - c. developing and maintaining nursing policy and procedure manuals;
 - d. developing and maintaining written job descriptions for each level of nursing personnel;
 - e. scheduling of daily rounds to visit residents;
 - f. developing methods for coordination of nursing services with other resident services;
 - g. recruiting and retaining the number and levels of nursing personnel necessary to meet the nursing care needs of each resident;
 - h. developing staff training programs for nursing service personnel;
 - i. participating in the planning and budgeting for nursing services;
 - j. ensuring that all health services notes are informative and descriptive of the supervision and care rendered including the resident's response to his or her care;
 - k. assessing the nursing requirements for each resident admitted and assisting the attending physician in planning for the resident's care;
 - l. participating in the development and implementation of the resident assessment (MDS) and comprehensive care plan;
 - m. establishing resident selection criteria for determining which residents may be fed by paid feeding assistants; and
 - n. assuring that nursing care personnel are administering care and services in accordance with the resident's assessment and care plan.

Employee Identification and Employment Eligibility

Policy Statement

Individuals who are not authorized to work in the United States or are not eligible for employment in long-term care facilities are not offered employment.

Policy Interpretation and Implementation

1. The facility verifies each employee's employment eligibility.
2. The IRS Form I-9 (Section 1) is completed by the employee no later than the first day of employment.
3. The IRS Form I-9 (Section 2) is completed by the facility within 3 days of the employee's first day of employment.
4. If an employee is hired for fewer than 3 business days, the form is completed in its entirety by the first day of employment.
5. Upon completion of I-9 Section 1, the HR director or his/her designee will examine the employee's Form I-9 to insure that it is legible, dated, fully completed, and signed.
6. All personnel employed by this facility must provide to the HR director proof of employment authorization and identity within three business days of the date employment begins.
7. No later than 3 business days after the employee's completion of the Form I-9 Section 1, the HR director, or his/her designee, will:
 - a. physically examine eligibility and identity documentation to ensure that it reasonably appears to be genuine and relates to the person presenting the form;
 - b. complete the employment verification portion of the Form I-9 (Section 2) by recording the required information from the documents presented; and
 - c. verify and attest, based upon an examination of the documents, the employee's eligibility for employment.
8. The employee will be present with the individual examining the documentation. The individual verifying the documentation will be the same individual who completes and signs Section 2.
9. The employee may choose which document(s) he or she presents as proof of employment authorization and identity (documents must be unexpired).
10. The following documents may be used to establish proof of identity **and** employment authorization:
 - a. U.S. Passport or U.S. Passport Card;
 - b. Permanent Resident Card or Alien Registration Receipt Card (Form I-551);
 - c. Foreign passport that contains a temporary I-551 stamp or temporary I-551 printed notation on a machine-readable immigrant visa (MRIV);
 - d. Employment Authorization Document (EAD) that contains a photograph (Form I-766). Form I-766 expired on its face combined with Form I-797 based on an automatic EAD extension in certain circumstances qualifies as unexpired Form I-766 (see Section 4.2 Automatic Extensions of Employment Authorization Documents in Certain Circumstances);

continues on next page

- e. For a nonimmigrant alien authorized to work for a specific employer incident to status, a foreign passport with Form I-94 or Form I-94A bearing the same name as the passport and an endorsement of the alien's nonimmigrant status, as long as the period of endorsement has not yet expired and the proposed employment is not in conflict with any restrictions or limitations identified on the form; and/or
 - f. Passport from the Federated States of Micronesia (FSM) or the Republic of the Marshall Islands (RMI) with Form I-94 or Form I-94A indicating nonimmigrant admission under the Compact of Free Association Between the United States and the FSM or RMI.
11. The following documents may be used to establish proof of identity (for those 18 years of age and older):
- a. Driver's license or ID card issued by a state or outlying possession of the United States, provided it contains a photograph or information such as name, date of birth, gender, height, eye color, and address;
 - b. ID card issued by federal, state, or local government agencies or entities, provided it contains a photograph or information such as name, date of birth, gender, height, eye color, and address;
 - c. School ID card with a photograph;
 - d. Voter's registration card;
 - e. U.S. military card or draft record;
 - f. Military dependent's ID card;
 - g. U.S. Coast Guard Merchant Mariner Card;
 - h. Native American tribal document; or
 - i. Driver's license issued by a Canadian government authority.
12. The following documents may be used to establish proof of identity (for those under 18 years of age):
- a. School record or report card;
 - b. Clinic, doctor, or hospital record; or
 - c. Day-care or nursery record.
13. The following documents may be used to establish employment authorization:
- a. A Social Security Account Number card unless the card includes one of the following restrictions:
 - (1) NOT VALID FOR EMPLOYMENT;
 - (2) VALID FOR WORK ONLY WITH INS AUTHORIZATION; or
 - (3) VALID FOR WORK ONLY WITH DHS AUTHORIZATION.
 - b. Certification of report of birth issued by the U.S. Department of State (Forms DS-1350, FS-545, FS-240);
 - c. Original or certified copy of a birth certificate issued by a state, county, municipal authority or outlying territory of the United States bearing an official seal;
 - d. Native American tribal document;
 - e. U.S. Citizen Identification Card (Form I-197);
 - f. Identification Card for Use of Resident Citizen in the United States (Form I-179); or
 - g. Employment authorization document issued by the Department of Homeland Security. For examples see www.uscis.gov/i-9-central.
14. An employee is NOT required to provide a social security card, or any document containing his or her social security number. If an employee has applied for, and has not yet received a social security number, he or she may work while awaiting his or her number if all Form I-9 requirements are met.
15. Social security numbers (if one has been issued) are only required for E-verify purposes.

Hazard Communication Program

Policy Statement

The purpose of the hazard communication program is to ensure that the hazards of all chemicals used in this facility have been classified and that the information concerning the hazard is communicated to employees.

Policy Interpretation and Implementation

1. Certain chemicals and substances with which the employees of this facility come in contact have the potential to cause or contribute to serious health conditions and may cause fires, explosions, or other serious accidents.
2. The hazard communication standard applies to any chemical that is known to be present in the workplace, which employees may be exposed to under normal working conditions or during a foreseeable emergency.
3. This facility's hazard communication program has been developed to ensure that:
 - a. hazardous chemicals and substances with which employees may come in contact are identified and classified;
 - b. hazards are properly labeled and recognizable;
 - c. information about hazards is communicated to employees; and
 - d. employees are given sufficient information regarding protective measures.
4. The hazard communication program includes:
 - a. a written hazard communication plan;
 - b. lists of hazardous chemicals used in the workplace;
 - c. labels on containers of hazardous chemicals shipped to and stored in the workplace;
 - d. preparation and distribution of safety data sheets to employees; and
 - e. employee training programs regarding hazardous substances and protective measures.
5. The hazard communication program coordinator will ensure that hazardous substances are labeled in accordance with OSHA requirements, and consistent with the provisions of United Nations *Globally Harmonized System of Classification and Labeling of Chemicals* (GHS).
6. Additional GHS labeling of the following chemicals is not required, as long as these substances are subject to the labeling requirements of the agencies that regulate them (EPA, Department of Agriculture, etc.):
 - a. Pesticides;
 - b. Agricultural or vegetable seed treated with pesticides;
 - c. Drugs (in solid, final form) that are intended for direct administration to a resident, or intended for personal consumption by employees in the workplace;
 - d. Ionizing or non-ionizing radiation;
 - e. Biological hazards/ hazardous waste;
 - f. Tobacco or tobacco products intended for use by residents or staff;
 - g. Wood or wood products (unless treated with a hazardous chemical covered by the hazard communication standard);
 - h. Alcoholic beverages;

continues on next page

- i. Foods sold, used or prepared on site, or intended for personal consumption by staff; and
 - j. Food additives or color additives.
7. Inquiries concerning hazardous chemicals and substances should be referred to the program coordinator or to the safety officer.

Identification Name Badges

Policy Statement

In order to promote safety and security measures established by our facility, each employee must wear his/her identification name badge at all times while on duty.

Policy Interpretation and Implementation

1. All personnel are required to wear identification name tags or badges during their work shift.
2. An identification name tag or badge must be clearly visible and contain a picture of the employee (optional), the employee's first name initial, last name and job title (i.e., J. Doe, RN; S. Day, Activity Director, etc.).
3. The personnel/human resources director, or designee, will be responsible for preparing the employee's identification tag or badge. Department directors or supervisors will issue a newly hired or reassigned employee his/her identification tag or badge upon reporting for work.
4. Employees will be responsible for maintaining their identification tags or badges and wearing them to work. Employees who chronically lose or forget their identification tags or badges may be subject to disciplinary action. (Note: Chronically losing or forgetting an identification tag or badge is defined as three (3) or more times during a pay period.)
5. Employees must report lost identification tags or badges to their supervisors so that replacement tags/badges can be issued.
6. The facility will provide the initial identification name tag or badge at no cost to the employee. However, the employee will be required to pay for lost identification name tags or badges.
7. Payment for a replacement tag or badge may be made to the personnel/human resources director at the time of reissue, or payment may be deducted from the employee's paycheck, whichever the employee chooses.

Injuries (On-the-Job)

Policy Statement

All injuries that occur to an employee while performing his/her job shall be reported to the employee’s department director and/or supervisor.

Policy Interpretation and Implementation

1. Regardless of the nature or severity of the injury, all on-the-job injuries occurring on our premises or to our employees while performing their jobs shall be reported to the injured employee’s department director and/or supervisor.
2. On-the-job injuries include, but are not limited to, the following events:
 - a. Needlesticks/sharps accidents;
 - b. Minor cuts, abrasions, and bruises;
 - c. Lacerations;
 - d. Severe bruises/contusions (with or without fracture);
 - e. Muscle strains or sprains;
 - f. Severe pain or discomfort, which may or may not be related to performance of job duties;
 - g. Episodes of loss of consciousness or seizures; and
 - h. Falls.
3. Emergency first aid treatment will be provided to an injured employee, unless the employee refuses such treatment.
4. Injuries shall be reported on the shift in which the injury occurred. Accident/incident reports shall be completed for all on-the-job injuries. The supervisor or department head shall forward such reports to the administrator for review and filing in the employee’s medical record.
5. Failure to report an on-the-job injury to the appropriate individual in a timely fashion may result in disciplinary action.

In-Service Training Program, Nurse Aide

Policy Statement

All nurse aide personnel participate in regularly scheduled in-service training classes.

Policy Interpretation and Implementation

1. All personnel are required to attend regularly scheduled in-service training classes.
2. The facility completes a performance review of nurse aides at least every 12 months.
3. In-service training is based on the outcome of the annual performance reviews, addressing weaknesses identified in the reviews.
4. Annual in-services:
 - a. ensure the continuing competence of nurse aides;
 - b. are no less than 12 hours per employment year;
 - c. address areas of weakness as determined by nurse aide performance reviews;
 - d. address the special needs of the residents, as determined by the facility assessment;
 - e. include training that addresses the care of residents with cognitive impairment; and
 - f. include training in dementia management and abuse prevention.
5. Insofar as practical, notice of in-service training classes, their time, place, date, etc., are posted on the employee bulletin board at least seven (7) days prior to the scheduled class.
6. Attendance of in-service training classes is considered working time for pay purposes.
7. Only the personnel director may excuse an employee from an in-service training class.
8. All training classes attended by the employee are entered on the respective employee's *Record of In-Service* by the department supervisor or other person(s) as designated by the supervisor.
9. Records are filed in the employee's personnel file or are maintained by the department supervisor.

Latex Allergies

Policy Statement

The facility shall provide non-latex equipment and supplies for individuals with latex sensitivities.

Policy Interpretation and Implementation

1. Latex exposure shall be minimized or eliminated among latex sensitive individuals.
2. The facility is responsible for providing latex-free supplies to residents or staff with latex sensitivity.
3. The nursing staff will have knowledge of guidelines from the Centers for Disease Control (CDC) and Occupational Safety and Health Administration (OSHA) regarding the prevention of allergic reactions to latex in the workplace.
4. Staff and resident education will be available concerning latex allergies.
5. The pharmacy shall be available to help facility staff identify any products that may contain latex (such as rubber lids on tops of bottles).

Legal Documents

Policy Statement

Nursing service personnel are not permitted to witness legal documents unless authorized by the administrator, or his/her designee.

Policy Interpretation and Implementation

1. Nursing personnel asked by the resident or the resident’s family members to witness legal documents must inform them that such actions must be authorized by administration.
2. Should the administrator permit witnessing procedures, it must be duly witnessed by a notary public. (Note: In unusual or critical circumstances, the administrator may waive this rule and permit the director of nursing services to witness the document.)
3. Law enforcement officials must be accompanied by a staff member when serving legal documents on residents or employees.
4. Should the facility be served with a subpoena during non-business office hours/holidays, the nurse supervisor/charge nurse receiving the subpoena must place the subpoena in the business office mail slot or secure the subpoena in the drug room until the next business day. Subpoenas must be delivered to the business office as soon as possible.
5. The administrator must be informed of (and delivered) the subpoena as soon as possible. The nurse supervisor/charge nurse may email the administrator or business office that a subpoena has been received and is stored at the nurses’ station.
6. Staff personnel observing violations of this policy must immediately report such action to their supervisor.
7. All requests for the serving of legal documents and/or the witnessing of legal documents should be referred to the business office.

Lost and Found

Policy Statement

Our facility shall assist all personnel and residents in safe-guarding their personal property.

Policy Interpretation and Implementation

1. All items found on the premises must be turned over to the business office within 24 hours after the items are found.
2. Items left by discharged residents must be reported to the director of nursing services.
3. A receipt, describing the lost item(s), will be provided to the person turning in lost items. If items are not claimed within 30 days, items will be returned to the person to whom the receipt was issued.
4. Our facility assumes no responsibility or liability for employee valuables. If an employee suspects that he/she has lost items on our premises, he/she must report such to his/her supervisor.
5. Department directors and supervisors should discourage employees from bringing large sums of money or other valuables to work with them.
6. Resident or family complaints of missing items must be reported to the director of nursing services.
7. Lost and found records will be maintained for one (1) year, then destroyed.
8. Reports of misappropriation or mistreatment of resident property are immediately investigated.

Nurse Aide Qualifications and Training Requirements

Policy Statement

Nurse aides must undergo a state-approved training program.

Policy Interpretation and Implementation

1. “Nurse aide” is defined as any individual providing nursing or nursing-related services to residents in our facility who is not a licensed health professional, a registered dietitian, or someone who volunteers to provide such services without pay.
2. Individuals applying for the position of nurse aide must:
 - a. be a minimum of 18 years of age;
 - b. possess a sincere desire to serve the ill, aged, and infirm;
 - c. be able to read, write, and speak the English language in an understandable manner;
 - d. give the facility written permission to conduct a background reference check; and
 - e. meet the Department of Labor’s employment eligibility requirements.
3. In keeping with the Omnibus Budget Reconciliation Act of 1987 (OBRA), our facility will only employ those nurse aides who meet the requirements set forth in the federal and state statutes concerning the staffing of long-term care facilities.
4. Our facility will not employ any individual as a nurse aide for more than four (4) months full-time, temporary, per diem, or otherwise, unless:
 - a. that individual is competent to provide designated nursing care and nursing related services; and
 - b. that individual has completed a training program and competency evaluation program, or a competency evaluation program approved by the state; or
 - c. that individual has been deemed competent as provided in §483.150(a) and (b) of the requirements of participation.
5. Our facility will not use any individual as a nurse aide who has worked less than four (4) months unless the individual:
 - a. is a full-time employee and participating in a state-approved training and competency evaluation program; or
 - b. has demonstrated competence through satisfactory participation in a state-approved nurse aide training and competency evaluation program; or
 - c. has been determined competent as provided in §483.150(a) and (b) of the requirements of participation.

continues on next page

6. Applicants who meet the qualifications for a nurse aide and are in training will have a minimum of 16 hours of training in the following areas prior to direct contact with the residents:
 - a. Communication and interpersonal skills;
 - b. Infection control;
 - c. Safety/emergency procedures;
 - d. Promoting residents' independence;
 - e. Respecting residents' rights;
 - f. Basic nursing skills (including):
 - (1) Taking and recording vital signs;
 - (2) Measuring and recording height and weight;
 - (3) Caring for the residents' environment;
 - (4) Recognizing abnormal changes in body functioning and the importance of reporting such changes to a supervisor; and
 - (5) Caring for residents when death is imminent.
 - g. Personal care skills (including):
 - (1) Bathing;
 - (2) Grooming, including mouth care;
 - (3) Dressing;
 - (4) Toileting;
 - (5) Assisting with eating and hydration;
 - (6) Proper feeding techniques;
 - (7) Skin care; and
 - (8) Transfers, positioning, and turning.
 - h. Mental health and social service needs (including):
 - (1) Modifying aide's behavior in response to residents' behavior;
 - (2) Awareness of developmental tasks associated with the aging process;
 - (3) How to respond to resident behavior;
 - (4) Allowing the resident to make personal choices, providing and reinforcing other behavior consistent with the resident's dignity; and
 - (5) Using the resident's family as a source of emotional support.
 - i. Care of cognitively impaired residents (including):
 - (1) Techniques for addressing the unique needs and behaviors of individuals with dementia (Alzheimer's and others);
 - (2) Communicating with cognitively impaired residents;
 - (3) Understanding the behavior of cognitively impaired residents;
 - (4) Appropriate responses to the behavior of cognitively impaired residents; and
 - (5) Methods of reducing the effects of cognitive impairments.
 - j. Basic restorative services (including):
 - (1) Training the resident in self care according to the resident's abilities;
 - (2) Use of assistive devices in transferring, ambulation, eating, and dressing;
 - (3) Maintenance of range of motion;
 - (4) Proper turning and positioning in bed and chair;
 - (5) Bowel and bladder training; and
 - (6) Care and use of prosthetic and orthotic devices.

continues on next page

- k. Resident rights (including):
 - (1) Providing privacy and maintenance of confidentiality;
 - (2) Promoting the residents’ rights to make personal choices to accommodate their needs;
 - (3) Giving assistance in resolving grievances and disputes;
 - (4) Providing needed assistance in getting to and participating in resident and family groups and other activities;
 - (5) Maintaining care and security of residents’ personal possessions;
 - (6) Promoting the resident’s right to be free from abuse, mistreatment, and neglect and the need to report any instances of such treatment to appropriate facility staff; and
 - (7) Avoiding the need for restraints in accordance with current professional standards.
- 7. Nursing assistants failing to successfully complete the required training program within the first four (4) months of their date of employment may be terminated from employment or may be reassigned to non-nursing related services.
- 8. Any person who has not performed nursing or nursing-related services for pay for a continuous twenty-four (24) month period after completion of a training and competency evaluation program, must complete a new training and competency evaluation program.
- 9. Inquiries concerning nurse aide training should be referred to the personnel director or to the director of nursing services.

Nursing Services Policy and Procedure Manual

Policy Statement

Services provided to our residents are performed in accordance with current acceptable standards of clinical practice.

Policy Interpretation and Implementation

1. A nursing services policy and procedure manual is available for use by all personnel providing resident care.
2. Our facility's nursing services policy and procedure manuals contain step-by-step guidance for each type of nursing care rendered. Staff are encouraged to reference such manual(s) when needed to assure that appropriate protocols are followed in accordance with established procedures.
3. Our procedure manual is developed using current resource data from approved textbooks on nursing care/ treatments, professional journals, and practice guidelines from government agencies (e.g., CMS, CDC, OSHA, etc.).
4. Our procedure manuals are updated on a continuous basis. Staff are encouraged to make recommendations and to participate in such revisions. Staff are informed of revisions via in-service training programs, email notices, and staff meetings.

On-the-Job Training

Policy Statement

On-the-job training programs will be conducted when necessary to assist employees in performing their assigned tasks.

Policy Interpretation and Implementation

1. On-the-job training is provided to train each employee in his/her respective job assignment and our methods of performing such tasks.
2. Department directors will be responsible for on-the-job training to assure that our established training schedules are followed. (Note: Non-supervisory personnel may be assigned as on-the-job trainers.)
3. On-the-job training begins on the first day of employment and is completed when the department director is satisfied that the employee can perform his/her assigned duties, within the time frame allotted for each particular function, without any further supervision.
4. Insofar as practical, on-the-job training will be conducted during the employee's normal working hours.
5. Each employee is required to participate in our on-the-job training program, unless otherwise excused by the department director and HR director.
6. All training programs and classes attended by an employee shall be entered on his/her *Employee Training Attendance Record*.
7. Training records will be filed in the employee's personnel file or may be maintained by the department supervisor.

Orientation Program for Newly Hired Employees, Transfers, Volunteers

Policy Statement

An orientation program shall be conducted for all newly hired employees, transfers from other departments, those providing services under contractual arrangements, and volunteers.

Policy Interpretation and Implementation

1. All newly hired personnel/volunteers/transfers/contactors must attend a 10-hour orientation program within their first five (5) days of hire.
2. The orientation program is separate from the required state-approved nurse aide training program, and the role-specific training and/or in-service training of new and existing staff.
3. Our orientation program includes, but is not limited to the following:
 - a. A tour of the facility, which includes:
 - (1) a description of the resident population;
 - (2) an overview of the resident's daily routine; and
 - (3) a demonstration of the use of the resident's call light and intercom system.
 - b. Instructions in procedures to be followed in an emergency which includes, but is not limited to:
 - (1) unusual occurrences with residents (i.e., accidents, wandering, missing, etc.);
 - (2) fire safety;
 - (3) disaster preparedness; and
 - (4) accident prevention and emergency first aid procedures.
 - c. An introduction to resident care procedures, which includes, but is not limited to:
 - (1) a review of the facility's Nursing Services Policy and Procedure Manual;
 - (2) a review of the facility's Nursing Assistant's Training Program;
 - (3) a review of the facility's In-Service Training Program;
 - (4) a review of the facility's infection control practices; and
 - (5) a review of the facility's philosophy of care.
 - d. An introduction of our administrative structure, which includes:
 - (1) a review of our organized staff including an introduction to each department supervisor;
 - (2) an overview of each department's services;
 - (3) a review of the employee's job description;
 - (4) a review of resident rights; and
 - (5) a review of personnel policies.
4. In addition to our general orientation, each department orients the newly hired employee/transfer/volunteer/contractor to his or her department's policies and procedures, as well as other data that will aid him/her in understanding the team concept, attitudes and approaches to resident care.
5. Our orientation program is an in-depth review of our facility's policies and procedures. A checklist is used to record materials reviewed.
6. A written record is maintained of each participant's orientation program.

continues on next page

7. Orientation records include the date reviewed, participant’s initials, subject matter reviewed, and other information deemed necessary or appropriate.
8. Records of orientation are filed in the personnel file upon completion of the orientation program.
9. Completed copies of *Employee Orientation Checklists* are filed in the employee’s personnel file.

OSHA Forms 300, 300A, and 301

Policy Statement

Our facility will record OSHA recordable injuries and illnesses on an OSHA Form 300 within seven (7) calendar days of receiving information about the occupational injury/illness.

Policy Interpretation and Implementation

1. Within seven (7) working days from the time an injury is reported to management (e.g., employee supervisor, department supervisor, etc.), an accident/incident report will be submitted to the safety officer to determine if such injury is recordable (work-related) under the OSHA program requirements.
2. The OSHA Form 301 (Injury and Illness Incident Report) or a facility-approved form may be used to record work-related injuries or illnesses.
3. An injury or illness is considered work-related (recordable) if an event or exposure in the work environment caused or contributed to the condition or significantly aggravated a preexisting condition. Work-related is presumed for injuries and illnesses resulting from events or exposures occurring in the workplace.
4. On February 1st of each year, OSHA Form 300A (Summary of Work-Related Injuries and Illnesses) will be posted on the employee bulletin board. This report will remain on the bulletin board until April 30th of that year. Such report will be posted even if no work-related injuries or illnesses occurred.
5. OSHA Forms 300, 300A and 301 will be kept on file in the business office for a period of five (5) years.
6. Inquiries concerning the recording of work-related occupational injuries and illnesses should be referred to the safety and health program coordinator or his/her designee.
7. If OSHA forms are voluntarily disclosed to persons other than government representatives, employees, former employees or authorized representatives (as required by §§1904.35 and 1904.40), employees' names and other personally identifying information shall be removed or hidden, except under the circumstances listed below.
8. Forms with personally identifying information may be disclosed only:
 - a. to an auditor or consultant hired by the employer to evaluate the safety and health program;
 - b. to the extent necessary for processing a claim for workers' compensation or other insurance benefits;
or
 - c. to a public health authority or law enforcement agency for uses and disclosures for which consent, an authorization, or opportunity to agree or object is not required under Department of Health and Human Services Standards for Privacy of Individually Identifiable Health Information (45 CFR 164.512).

Paging System

Policy Statement

The facility is equipped with an overhead paging system for use during emergencies.

Policy Interpretation and Implementation

1. Our facility is equipped with a paging system for the purpose of relaying emergency information, conducting fire and disaster drills, and for relaying urgent information to employees, residents, and visitors.
2. Department directors, supervisors and other personnel responsible for paging functions are trained in the use of our paging system.
3. Emergency codes for paging personnel have been established. A listing of these codes is posted at each nurses' station.
4. Emergency paging codes are reviewed during employee orientation and annual in-service training programs.

Posting Direct Care Daily Staffing Numbers

Policy Statement

Our facility will post, on a daily basis for each shift, the number of nursing personnel responsible for providing direct care to residents.

Policy Interpretation and Implementation

1. Within two (2) hours of the beginning of each shift, the number of licensed nurses (RNs, LPNs, and LVNs) and the number of unlicensed nursing personnel (CNAs) directly responsible for resident care will be posted in a prominent location (accessible to residents and visitors) and in a clear and readable format.
2. *Directly responsible for resident care* means that individuals are responsible for residents' total care or some aspect of the residents' care including, but not limited to, assisting with activities of daily living (ADLs), performing gastrointestinal feeds, giving medications, supervising care given by CNAs, and performing nursing assessments to admit residents or notify physicians of changes of condition.
3. Shift staffing information shall be recorded on the *Nursing Staff Directly Responsible for Resident Care* form for each shift. The information recorded on the form shall include the following:
 - a. The name of the facility.
 - b. The date for which the information is posted.
 - c. The resident census at the beginning of the shift for which the information is posted.
 - d. Twenty-four (24)-hour shift schedule operated by the facility.
 - e. The shift for which the information is posted.
 - f. Type (RN, LPN, LVN, or CNA) and category (licensed or non-licensed) of nursing staff working during that shift.
 - g. The actual time worked during that shift for each category and type of nursing staff.
 - h. Total number of licensed and non-licensed nursing staff working for the posted shift.
4. When computing hours of direct care staff working split shifts, count only the *total* number of hours the individual is actually scheduled to work for the shift information being posted. (Example: You are posting data for the *day shift*. A CNA reports to work and is scheduled to work four (4) hours on the *day shift* and four (4) hours on the *evening shift*. In computing the number of hours worked for that shift, count only the four (4) hours scheduled for the *day shift*. The remaining four (4) hours would then be counted toward the totals on the *evening shift*.)
5. Within two (2) hours of the beginning of each shift, the shift supervisor shall compute the number of direct care staff and complete the *Nursing Staff Directly Responsible for Resident Care* form. The shift supervisor shall date the form, record the census and post the staffing information in the location(s) designated by the administrator.
6. The form may be typed or handwritten. If completed by typewriter or word processor, the recorded information shall be a minimum font size of 12 points. Should the information be handwritten, it must be legibly printed in *black ink* and must be written so that staffing data can be easily seen and read by residents, staff, visitors or others who are interested in our facility's daily staffing information.

continues on next page

7. The previous shift's forms shall be maintained with the current shift form for a total of 24 hours of staffing information in a single location. Once a form is removed, it shall be forwarded to the director of nursing services' office and filed as a permanent record.
8. Records of staffing information for each shift will be kept for a minimum of eighteen (18) months or as required by state law (whichever is greater).
9. Staffing information during the recorded time period shall be made available to residents, family members, and the public within 24 hours of a written or verbal request. The fee for the requested information shall not exceed the cost of copying and clerical time to retrieve the information.
10. Direct care staffing information will be reported quarterly to CMS through the QIES Payroll-Based Journal electronic reporting system.
11. Inquiries concerning our direct care staffing information should be referred to the director of nursing services or to the administrator.

Registry of Nurse Aides

Policy Statement

Certified nurse aide licenses shall be verified through the registry of nurse aides before individuals may serve as nurse aides or nursing assistants.

Policy Interpretation and Implementation

1. Each certified nurse aide applying for a nurse aide position must present to the HR director, or other designee, a copy of his/her registration number.
2. The HR director, or other designee, is responsible for contacting the state nurse aide registry to determine the validity of the individual's certification status.
3. Should the facility find that an individual is not in the registry, that individual must enroll in a nurse aide training program prior to serving as a nurse aide, unless:
 - a. the individual is a full-time employee who is in a state-approved training and competency evaluation program; or
 - b. the individual can prove that he or she has recently completed a state-approved training and competency evaluation program and has not yet been included in the registry.
4. If there is reason to believe that an individual may be registered with more than one state registry, then information about the individual will be requested from each state that he or she may be registered with.
5. If the individual has been terminated from another facility for resident abuse, the nurse aide will not be employed and/or will be terminated from employment, whichever case may apply.
6. If there has been a period of 24 months or more since the individual completed a training and competency evaluation program and during that period has not provided nursing-related services for monetary evaluation, that individual must complete another competency evaluation program (with or without training) before serving as a nurse aide. The nurse aide will be furnished with a copy of the report obtained from the registry so that he/she has an opportunity to correct any inaccurate data on the file in the registry.
7. The state nurse aide registry contains, as a minimum, the following information on each certified nurse aide:
 - a. The individual's full name;
 - b. Information necessary to identify each individual;
 - c. The date the individual became eligible for placement in the registry through successfully completing a nurse aide training and competency evaluation program or competency evaluation program or by meeting the requirements of § 483.150; and
 - d. The following information on any finding by the state survey agency of abuse, neglect, or misappropriation of property by the individual:
 - (1) Documentation of the state's investigation, including the nature of the allegation and the evidence that led the state to conclude that the allegation was valid;
 - (2) The date of the hearing, if the individual chose to have one, and its outcome; and
 - (3) A statement by the individual disputing the allegation, if he or she chooses to make one.

continues on next page

8. Information concerning any finding by the state survey agency of abuse, neglect, or misappropriation of property by an individual must be included in the registry within 10 working days of the finding and must remain in the registry permanently, unless the finding was made in error, the individual was found not guilty in a court of law, or the State is notified of the individual's death.
9. The HR director, or other designee, is responsible for notifying the state registry of:
 - a. the date the certified nurse aide was hired;
 - b. the date the certified nurse aide was terminated from employment; and
 - c. the reason for the termination of employment.
10. Inquiries concerning the nurse aide registry should be referred to the HR director, or to the director of nursing services.

Reporting Direct-Care Staffing Information (Payroll-Based Journal)

Policy Statement

Staffing and census information will be reported electronically to CMS through the Payroll-Based Journal system in compliance with 6106 of the Affordable Care Act.

Policy Interpretation and Implementation

1. Beginning with the fiscal quarter of 2016 (beginning July 1, 2016), direct-care staffing and census information will be reported electronically to CMS through the Payroll-Based Journal (PBJ) system.
2. Direct-care staffing information includes staff hired directly by the facility, those hired through an agency, and contract employees.
3. Providers who are employed by the facility (including physicians) are included in direct-care staffing information; providers who bill Medicare directly are not included.
4. For auditing purposes, reported staffing information is based on payroll records, or other verifiable information.
5. Information may be uploaded to the PBJ system manually, or through a payroll time and attendance system, or a combination of both.
6. The PBJ system is accessed through the QIES at <https://www.qtso.com/>.
7. Manual entries are made only by designated personnel with training on the PBJ user interface.
8. Technical specifications for uploading data directly from a payroll or time and attendance system will be accessed through: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/NursingHomeQualityInits/Staffing-Data-Submission-PBJ.html>.
9. Staffing information is collected daily and reported for each fiscal quarter no later than 45 days after the end of the reporting quarter. Dates are as follows:

Fiscal Quarter	Date Range	Submission Deadline
1	October 1- December 31	February 14
2	January 1- March 31	May 15
3	April 1 – June 30	August 14
4	July 1 – September 30	November 14

10. Staffing data includes the number of hours worked each day by each staff member.
11. Census data is reported each fiscal quarter and includes resident census on the last day of each month of the quarter.

continues on next page

12. Definitions, instructions and examples of the PBJ user interface can be found in CMS' *Electronic Staffing Data Submission Payroll-Based Journal Long-Term Care Facility Policy Manual*. A current copy of this manual can be accessed at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/NursingHomeQualityInits/Staffing-Data-Submission-PBJ.html>
13. A manual log is available to record information should the facility experience temporary internet outage and cannot record staffing data directly to the PBJ system. This log may also serve as a tool to record data that will be manually uploaded quarterly.

Reporting Musculoskeletal Disorders

Policy Statement

Our facility shall strive to reduce the number and severity of musculoskeletal disorders (MSDs) caused by exposure to risk factors associated with tasks performed while providing care or services to our residents.

Policy Interpretation and Implementation

1. Our facility has developed an ergonomics program that provides our staff with information relative to the prevention of musculoskeletal disorders.
2. Employees should report any of the following signs and symptoms to their supervisor:
 - a. Painful joints;
 - b. Pain in wrists, shoulders, forearms, knees;
 - c. Pain, tingling or numbness in hands or feet;
 - d. Fingers or toes turning white;
 - e. Shooting or stabbing pains in arms or legs;
 - f. Back or neck pain;
 - g. Swelling or inflammation;
 - h. Stiffness; and/or
 - i. Burning sensation.
3. Any injury or illness suffered while on duty shall be reported to the supervisor and recorded in accordance with OSHA’s occupational injury and illness recording and reporting regulations (29 CFR 1904).
4. Prior to or upon employment, all employees undergo an orientation program that includes information relative to our facility’s ergonomics program.
5. Inquiries relative to our ergonomics program should be referred to the administrator or director of nursing services.

Safety of Employees

Policy Statement

As part of our efforts to provide a safe and healthful environment for all employees, residents, and visitors, the facility shall comply with applicable governmental health and safety requirements.

Policy Interpretation and Implementation

1. The facility shall verify compliance with all federal, state, and local health and safety regulations and shall take steps to correct any violations thereof.
2. The facility shall investigate all accidents, incidents, and on-the-job injuries and shall complete any required reports pertaining to any such investigation.
3. The facility shall investigate and correct any work conditions that are unsafe, unhealthy, or not in compliance with governing regulations and shall complete any required reports pertaining to such investigations.
4. To help ensure that the facility remains in compliance with all applicable regulations, each employee of this facility is expected to report any accidents, incidents, on-the-job injuries, safety or health violations, and unsafe or unhealthy working conditions to his/her supervisor or the human resources director. Employees may also make recommendations pertaining to the facility's safety and health issues.
5. The facility shall provide orientation programs and training for employees regarding the safety program.
6. Department directors shall review departmental safety precautions, rules, regulations, and procedures with their assigned personnel upon assignment and periodically thereafter.

Smoking Policy – Employees

Policy Statement

It is the policy of this facility to provide our employees with as near a smoke-free environment as possible and to ensure safe smoking practices for those who smoke.

Policy Interpretation and Implementation

Smoking Provisions—Employees.

1. Employee smoking is permitted only in places where it is designated. Smoking is prohibited in all other areas.
2. Areas where smoking is permitted are posted with a “Designated Smoking Area” sign.
3. Only the administrator has the authority to designate an area of the facility as a smoking area.
4. Smoking is prohibited in any area where oxygen is being used or stored, in any area that bears a “No-Smoking” sign, or in any area that would create a hazardous or unsafe condition.
5. Smoking is prohibited in public areas or where groups of people frequently gather. They include, but are not limited to the following areas:
 - a. Reception areas;
 - b. Open office areas;
 - c. Elevators;
 - d. Stairwells;
 - e. Restrooms;
 - f. Conference/training rooms;
 - g. Corridors;
 - h. Computer room; and
 - i. Others as may be designated.

Resolving Conflicts.

1. Any employee who is dissatisfied with our smoking policies may file a complaint without fear of reprisal.
2. Grievance procedures should be followed as outlined in a separate manual.
3. Should an employee present a written, signed and dated physicians’ certification that exposure to smoke causes severe reactions, all reasonable efforts will be taken to accommodate the employee.

Residents and Visitors.

1. While this policy applies primarily to our staff, certain smoking restrictions apply to our residents and visitors.
2. Residents and visitors are not permitted to smoke in any area that is not designated as a smoking area. Smoking is not permitted in resident rooms.

continues on next page

Reporting Violations.

1. It is the responsibility of all personnel to report smoking violations. Violations should be reported to the department director as soon as practical.
2. Inquiries concerning smoking regulations should be referred to the administrator.

Staff Development Program

Policy Statement

All personnel must participate in initial orientation and regularly scheduled in-service training classes.

Policy Interpretation and Implementation

1. “Staff development” is defined as initial orientation, followed by regularly scheduled in-service training programs.
2. The primary objective of our facility’s staff development program is to ensure that staff have the knowledge, skills and critical thinking necessary to provide excellent resident care.
3. Training materials are provided at no cost to those attending.
4. Training methods and teaching materials are appropriate to the level of education and expected roles of those attending.
5. Required training topics include the following:
 - a. Effective communication with residents and family (direct care staff);
 - b. Resident rights and responsibilities;
 - c. Preventing abuse, neglect, exploitation, and misappropriation of resident property including:
 - (1) activities that constitute abuse, neglect, exploitation or misappropriation of resident property;
 - (2) procedures for reporting incidences of abuse, neglect, exploitation or misappropriation of resident property; and
 - (3) dementia management and resident abuse prevention.
 - d. Elements and goals of the facility QAPI program;
 - e. The infection prevention and control program standards, policies and procedures; and
 - f. The compliance and ethics program standards, policies and procedures.
6. Compliance and ethics training is conducted annually when this organization is operating five or more facilities.
7. In addition to the in-service training requirements outlined above, nurse aides (CNAs) are required to complete no less than 12 hours annually of in-service training that is sufficient to ensure the continuing competency of nurse aides and address any specific areas of weakness identified in performance evaluations and through the facility assessment.
8. Insofar as practical, notice of in-service training classes, their time, place, date, etc., will be posted on the employee bulletin board at least seven (7) days prior to the scheduled class.
9. Attendance at staff development classes is considered working time for pay purposes.
10. Only the HR director may excuse an employee from attending a staff development class.
11. All staff development classes attended by the employee are entered on the respective employee’s employee training attendance record by the department director or other person(s) designated by that director.
12. Records are filed in the employee’s personnel file or maintained by the department director.

Staffing

Policy Statement

Our facility provides sufficient numbers of staff with the skills and competency necessary to provide care and services for all residents in accordance with resident care plans and the facility assessment.

Policy Interpretation and Implementation

1. Licensed nurses and certified nursing assistants are available 24 hours a day to provide direct resident care services.
2. Staffing numbers and the skill requirements of direct care staff are determined by the needs of the residents based on each resident’s plan of care.
3. Other support services (e.g., dietary, activities/recreational, social, therapy, environmental, etc.) are also staffed to ensure that resident needs are met.
4. Direct care staffing information per day (including agency and contract staff) is submitted to the CMS payroll-based journal system on the schedule specified by CMS, but no less than once a quarter.
5. Inquiries or concerns relative to our facility’s staffing should be directed to the administrator or his/her designee.

Safe Lifting and Movement of Residents

Policy Statement

In order to protect the safety and well-being of staff and residents, and to promote quality care, this facility uses appropriate techniques and devices to lift and move residents.

Policy Interpretation and Implementation

1. Resident safety, dignity, comfort and medical condition will be incorporated into goals and decisions regarding the safe lifting and moving of residents.
2. Manual lifting of residents shall be eliminated when feasible.
3. Nursing staff, in conjunction with the rehabilitation staff, shall assess individual residents' needs for transfer assistance on an ongoing basis. Staff will document resident transferring and lifting needs in the care plan. Such assessment shall include the following:
 - a. Resident's preferences for assistance;
 - b. Resident's mobility (degree of dependency);
 - c. Resident's size;
 - d. Weight-bearing ability;
 - e. Cognitive status;
 - f. Whether the resident is usually cooperative with staff; and
 - g. The resident's goals for rehabilitation, including restoring or maintaining functional abilities.
4. Staff responsible for direct resident care will be trained in the use of manual (gait/transfer belts, lateral boards) and mechanical lifting devices.
5. Mechanical lifting devices shall be used for heavy lifting, including lifting and moving residents when necessary.
6. Only staff with documented training on the safe use and care of the machines and equipment used in this facility will be allowed to lift or move residents.
7. Staff will be observed for competency in using mechanical lifts and observed periodically for adherence to policies and procedures regarding use of equipment and safe lifting techniques.
8. Mechanical lifts shall be made readily available and accessible to staff 24 hours a day. Back-up battery packs on remote chargers shall be provided as needed so that lifts can be used 24 hours a day while batteries are being recharged.
9. Enough slings, in the sizes required by residents in need, will be available at all times. As an alternative, residents with lifting and movement needs will be provided with single-resident use disposable slings.
10. Maintenance staff shall perform routine checks and maintenance of equipment used for lifting to ensure that it remains in good working order.
11. All equipment design and use will meet or exceed guidelines and regulations concerning resident safety and the use of restraints.

continues on next page

12. Safe lifting and movement of residents is part of an overall facility employee health and safety program, which:
- a. involves employees in identifying problem areas and implementing workplace safety and injury-prevention strategies;
 - b. addresses reports of workplace injuries;
 - c. provides training on safety, ergonomics and proper use of equipment; and
 - d. continually evaluates the effectiveness of workplace safety and injury-prevention strategies.

Dorsal Recumbent Position

Level II

Purpose

The purpose of the dorsal recumbent position is to allow for examination of the head, neck, anterior thorax, lungs, breasts, axillae and heart.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Position the resident on his or her back.
3. Lock arms with the resident to position the pillow under his or her head.
4. Drape the resident with a blanket. Avoid unnecessary exposure of the resident's body.
5. Encourage the resident to assist you as much as possible.
6. Instruct or assist the resident to bend his/her knees with the feet flat on the bed surface.
7. Reposition the bed covers. Make the resident comfortable.
8. Place the call light within easy reach of the resident.
9. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
10. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Fowler's Position

Purpose

The purpose of the Fowler's position is to allow the resident to sit upright in bed.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Position the resident on his or her back.
3. Lock arms with the resident to position the pillow under his or her head.
4. Drape the resident with a blanket. Avoid unnecessary exposure of the resident's body.
5. Encourage the resident to assist you as much as possible.
6. Bend or assist the resident to bend his or her knees slightly.
7. Raise the head of the bed to a 45° angle.
8. Reposition the bed covers. Make the resident comfortable.
9. Place the call light within easy reach of the resident.
10. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
11. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Lifting Machine, Using a Mechanical

Level II

Purpose

The purpose of this procedure is to establish the general principles of safe lifting using a mechanical lifting device. It is not a substitute for manufacturer's training or instructions.

General Guidelines

1. At least two (2) nursing assistants are needed to safely move a resident with a mechanical lift.
2. Mechanical lifts may be used for tasks that require:
 - a. Lifting a resident from the floor;
 - b. Transferring a resident from bed to chair;
 - c. Lateral transfers;
 - d. Lifting limbs;
 - e. Toileting or bathing; or
 - f. Repositioning.
3. Types of lifts that may be available in the facility are:
 - a. Floor-based full body sling lifts;
 - b. Overhead full body sling lifts; and
 - c. Sit-to-stand lifts.
4. Lift design and operation vary across manufacturers. Staff must be trained and demonstrate competency using the specific machines or devices utilized in the facility.

Steps in the Procedure

1. Before using a lifting device, assess the resident's current condition, including:
 - a. Physical:
 - (1) Can the resident assist with transfer?
 - (2) Is the resident's weight and medical condition appropriate for the use of a lift?
 - b. Cognitive/Emotional:
 - (1) Can the resident understand and follow instructions?
 - (2) Does the resident express fear or appear anxious about the use of a lift?
 - (3) Is the resident agitated, resistant, or combative?
2. Measure the resident for proper sling size and purpose, according to manufacturer's instructions.
3. Select a sling bar that is appropriate for the resident's size and the task.
4. Prepare the environment:
 - a. Clear an unobstructed path for the lift machine;
 - b. Ensure there is enough room to pivot;
 - c. Position the lift near the receiving surface; and
 - d. Place the lift at the correct height.
5. Make sure the battery is charged.
6. Test the lift controls. Ensure the emergency release feature works.
7. Make sure the lift is stable and locked.
8. Make sure that all necessary equipment (slings, hooks, chains, straps and supports) is on hand and in good condition.

continues on next page

9. Double check the sling and machine's weight limits against the resident's weight.
10. Place the sling under the resident. Visually check the size to ensure it is not too large or too small.
11. Lower the sling bar closer to the resident.
12. Attach sling straps to sling bar, according to manufacturer's instructions.
 - a. Make sure the sling is securely attached to the clips and that it is properly balanced.
 - b. Check to make sure the resident's head, neck and back are supported.
 - c. Before resident is lifted, double check the security of the sling attachment.
 - d. Examine all hooks, clips or fasteners.
 - e. Check the stability of the straps.
 - f. Ensure that the sling bar is securely attached and sound.
13. Lift the resident 2 inches from the surface to check the stability of the attachments, the fit of the sling and the weight distribution.
14. Check the resident's comfort level by asking or observing for signs of pinching or pulling of the skin.
15. Slowly lift the resident. Only lift as high as necessary to complete the transfer.
16. Gently support the resident as he or she is moved, but do NOT support any weight.
17. When the transfer destination is reached, slowly lower the resident to the receiving surface.
18. Once the resident's weight is released, stop the lowering and ensure that the sling bar does not hit the resident.
19. Detach the sling from the lift.
20. Carefully remove the sling from under the resident. Be mindful of the resident's position and balance, and skin.

Sling Care:

1. Disinfect slings between residents (unless disposable).
2. Wash and sanitize according to manufacturer's instructions.
3. Discard any worn, frayed or ripped slings.

Lift Care:

1. Disinfect lift surfaces.
2. Wipe with a clean towel until dry.

Documentation

Document the following in the medical record:

1. The reason for the transfer.
2. The type of lift used.
3. Equipment size and condition.
4. The names and titles of staff assisting.
5. The resident's physical and mental condition before and after the procedure.
6. How the resident tolerated the procedure.

Locking Arms with the Resident

Level II

Purpose

The purposes of this procedure are to raise the resident's head and shoulders from the pillow so that the pillow can be adjusted and to assist the resident in moving to the head of the bed.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

General Guidelines

When moving a resident who cannot assist you, two (2) nursing assistants will be needed to lift the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Adjust the bed to a comfortable working position. (Note: Be sure the wheels are locked.)
3. Lower the bedside rails on the side you are working, if up. Lower the bed covers as necessary.
4. Face the head of the bed.
5. Stand with your feet approximately 12 inches apart with one foot ahead of the other.
6. Bend slightly at the knees.
7. Instruct the resident to place his or her arm under your arm and behind your shoulder. The resident's hand should be over the top of your shoulder. (Note: If you are standing on the resident's right, the resident's right arm will be locked with your right arm. The resident's right arm should be under your right arm, behind your shoulder with his or her hand on top of your right shoulder.)
8. Place your arm under the resident's arm with your hand on his or her shoulder.
9. **Count "1, 2, 3, go,"** so that you and the resident will be working together. This will allow the resident to pull himself or herself up as you support the resident. The resident should now have his or her head and shoulders raised.
10. With your free hand, turn or replace the pillow.
11. When you have repositioned or replaced the pillow, support the head and shoulder with your free hand while the resident gently eases himself or herself down.
12. Should the resident become weak or faint during the procedure, cease the procedure and summon the staff/charge nurse.
13. Reposition the bed to its lowest position for the safety of the resident.
14. Reposition the bed covers. Make the resident comfortable.
15. Place the call light within easy reach of the resident.
16. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
17. Wash and dry your hands thoroughly.

continues on next page

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Level II

Purpose

The purpose of this procedure is to turn a resident as a unit while keeping his/her spine straight.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Adjust the bed to a comfortable working position. (**Note:** Be sure the wheels are locked.)
3. Lower the side rails on the side of the bed you are working, if up.
4. Loosen the covers as necessary. Avoid unnecessary exposure of the resident's body.
5. Using a turning sheet move the resident toward the side of the bed where you are standing. Move the resident's body as a unit keeping the spine straight.
6. Place a pillow lengthwise between the resident's knees.
7. Cross the resident's arms across his/her chest.
8. Raise the side rail on your side of the bed and go to the other side. Lower this side rail.
9. Reach over the resident and roll the turning sheet as close to the resident as possible.
10. Turn the resident toward you with the turning sheet. Move the resident's body as a unit keeping the spine straight. Do not bend the resident's hips, joints or back.
11. Do not rush the procedure. Be gentle in rolling the resident.
12. Place pillows behind the resident's back to keep his/her body in proper alignment.
13. Reposition the bed covers. Make the resident comfortable.
14. Lower the bed to its lowest position.
15. Place the call light within easy reach of the resident.
16. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
17. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Moving a Mattress to the Head of the Bed

Level II

Purpose

The purpose of this procedure is to provide the steps necessary to reposition the mattress.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

Note: This procedure will require two (2) persons.

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Raise the height of the bed to a comfortable work level so that good body mechanics can be maintained. Unless otherwise instructed, lower the head of the bed.
3. Lower the side rails on both sides of the bed, if up.
4. Loosen the covers as necessary. Avoid unnecessary exposure of the resident's body.
5. One person stands on each side of the bed.
6. Lock arms with the resident and remove the pillow. Place the pillow on the chair or the foot of the bed. Lower resident down on the bed.
7. If the resident is able to assist, instruct him or her to:
 - a. Grasp the side rails with both hands.
 - b. Bend his or her knees and brace his or her feet firmly on the mattress.
 - c. On the count of "**1, 2, 3, go,**" push toward the head of the bed with his or her hands and push against the mattress with his or her feet.
8. Stand straight and turn slightly toward the head of the bed.
9. Keep your feet flat on the floor, approximately twelve (12) inches apart.
10. The foot nearest the head of the bed should be turned in that direction.
11. Grasp the mattress loops or sides of the mattress.
12. On the count of "**1, 2, 3, go,**" slide the mattress toward the head of the bed.
13. Flex your knees and shift the weight to the front foot.
14. Lock arms with the resident and reposition the pillow under the resident's head.
15. Reposition the bed covers. Make the resident comfortable.
16. Reposition the bed to its lowest horizontal position for the safety of the resident.
17. Place the call light within easy reach of the resident.
18. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
19. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.

continues on next page

2. The name and title of the individual(s) who assisted with the care.
3. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
4. How the resident tolerated the procedure.
5. Any problems or complaints made by the resident related to the procedure.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Prone Position

Level II

Purpose

The purpose of this procedure is to place the resident on his or her stomach. The resident's head is turned to one side and the arms are bent at the elbows toward the resident's head or positioned at the resident's side.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Raise the height of the bed to a comfortable working level. Unless otherwise instructed, lower the head and foot rest of the bed.
3. Lower the side rails on the side of the bed you are working, if up.
4. Avoid unnecessary exposure of the resident's body.
5. Encourage the resident to assist you as much as possible.
6. Instruct or assist the resident to turn on his or her stomach.
7. Position the resident's head on the pillow so that it is turned to the left or right side.
8. Position the resident's arms so that they are bent at the elbows toward the head or positioned at the resident's side.
9. Reposition the bed to its lowest horizontal position for the safety of the resident.
10. Reposition the bed covers. Make the resident comfortable.
11. Place the call light within easy reach of the resident.
12. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
13. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Repositioning

Level II

Purpose

The purpose of this procedure is to provide guidelines for the evaluation of resident repositioning needs, to aid in the development of an individualized care plan for repositioning, to promote comfort for all bed- or chair-bound residents and to prevent skin breakdown, promote circulation and provide pressure relief for residents.

Preparation

1. Review the resident's care plan to evaluate for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Repositioning is a common, effective intervention for preventing skin breakdown, promoting circulation, and providing pressure relief.
2. Evaluation of a resident's skin integrity after pressure has been reduced or redistributed should guide the development and implementation of repositioning plans. Such plans should be addressed in the comprehensive plan of care consistent with the resident's needs and goals.
3. Repositioning is critical for a resident who is immobile or dependent upon staff for repositioning.
4. The care plan for a resident at risk of friction or shearing during repositioning may require the use of lifting devices for repositioning.
5. Positioning the resident on an existing pressure ulcer should be avoided since it puts additional pressure on tissue that is already compromised and may impede healing.

Evaluation

1. Evaluate residents who can reposition independently to determine the following:
 - a. Is a positioning device needed to maintain independent positioning?
 - b. Does the resident need instruction about why turning is important?
 - c. Does the resident need encouragement to reposition?
 - d. Does the resident require monitoring to assure that turning occurs?
2. Evaluate the resident for an existing pressure ulcer. If present, positioning the resident on the existing ulcer should be avoided.
3. Evaluate residents who sit or recline in a chair with the back of the chair (or the back of the bed) elevated to or above a 30 degree angle:
 - a. Does the resident need scheduled position changes?
 - b. Does the resident need position changes more frequently than hourly?
4. Components to evaluate when a resident is in a chair:
 - a. Does the resident need intervention to maintain postural alignment?
 - b. Is the resident's weight distribution even?
 - c. Does the resident need devices to maintain sitting balance?
 - d. Is the resident able to learn? If so, teach resident to shift his/her weight every 15 minutes while in the chair.

continues on next page

5. Does the resident have a Stage I pressure ulcer?
6. What is the support surface in use?

Interventions

1. A turning/repositioning program includes a continuous consistent program for changing the resident's position and realigning the body. A program is defined as a specific approach that is organized, planned, documented, monitored and evaluated.
2. Frequency of repositioning a bed- or chair-bound resident should be determined by:
 - a. The type of support surface used;
 - b. The condition of the skin;
 - c. The overall condition of the resident;
 - d. The response to the current repositioning schedule; and
 - e. Overall treatment objectives.
3. Residents who are in bed should be on at least an every two hour (q2 hour) repositioning schedule.
4. For residents with a Stage I or above pressure ulcer, an every two hour (q2 hour) repositioning schedule is inadequate.
5. Residents who are in a chair should be on an every one hour (q1 hour) repositioning schedule.
6. If ineffective, the turning and repositioning frequency will be increased.
7. Avoid placing resident on the greater trochanter for more than momentary placement.

Preparation

1. Review the resident's care plan to evaluate for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when repositioning.

1. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

Repositioning the Resident in Bed

1. Check the care plan, assignment sheet or the communication system to determine resident's specific positioning needs including special equipment, resident level of participation and the number of staff required to complete the procedure.
2. Wash and dry hands thoroughly.
3. Apply gloves.
4. Raise the bed to waist level.
5. Lower the side rail, if applicable, on the side where you are standing.
6. Encourage the resident to participate if able.
7. Lower the sheets.
8. Check for incontinence. Follow steps to care for the incontinent resident, if necessary.
9. Use two people and a draw sheet to avoid shearing while turning or moving the resident up in bed. Encourage resident to place feet flat on bed and assist with pushing up. Encourage the use of an overhead trapeze if resident is able to use one.

continues on next page

10. Raise the head of the bed as little and for as short of a time as possible, and only as necessary for meals, treatments and as medically necessary.
11. Move the resident to his or her back.
12. Move the resident's top leg and shoulder in the direction of the turn.
13. Encourage resident to hold the side rail with the top arm in the direction of the turn, if possible.
14. Place the resident in a comfortable position in accordance with the resident's individualized care plan.
15. Prevent skin-to-skin contact with use of sheets, pillows or positioning devices.
16. Lower the bed into lowest position and place the side rails in the appropriate position as indicated in the resident's plan of care.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. Wash and dry hands thoroughly.
20. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Repositioning the Resident in the Chair

1. Encourage the chair-bound resident, who is able to move, to change positions or shift weight at least every fifteen (15) minutes, or as often as possible.
2. Check the care plan, assignment sheet or the communication system to determine resident-specific positioning needs including special equipment; resident level of participation and the number of staff required to complete the procedure.
3. Ask the resident's permission to reposition or assist in repositioning. Take the resident to a private location, if indicated.
4. Assist the resident to change his or her position in the chair. Monitor the need for toileting or incontinence care when changing position.
5. Place resident in a comfortable position in accordance with the resident's individualized care plan.
6. Prevent skin to skin contact with use of sheets, pillows or positioning devices.
7. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The position in which the resident was placed. This may be on a flow sheet.
2. The name and title of the individual who gave the care.
3. Any change in the resident's condition.
4. Any problems or complaints made by the resident related to the procedure.
5. If the resident refused the care and the reason(s) why.
6. Observations of anything unusual exhibited by the resident.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. If the resident refuses care, an evaluation of the basis for refusal, and the identification and evaluation of potential alternatives is indicated.
3. Report other information in accordance with facility policy and professional standards of practice.

Sims' Position

Level II

Purpose

The purpose of this procedure is to position the resident for a rectal examination or enema administration.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Raise the height of the bed to a comfortable working level.
3. Lower the side rails on the side of the bed you are working, if up.
4. Drape the resident with a blanket. Avoid unnecessary exposure of the resident's body.
5. Encourage the resident to assist you as much as possible.
6. Turn the resident on his or her left side.
7. Extend the left leg and arm. The left arm rests behind the resident.
8. Flex the right leg and arm.
9. Position the resident's head on the pillow.
10. Reposition the bed covers. Make the resident comfortable.
11. Place the call light within easy reach of the resident.
12. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
13. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Supine Position

Purpose

The purpose of this procedure is to place the resident on his or her back with the legs together and the knees slightly bent. This position is used primarily for physical examinations and assessments. This position is also called the horizontal recumbent position.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Lock arms with the resident to position the pillow under his or her head.
3. Drape the resident with a blanket. Avoid unnecessary exposure of the resident's body.
4. Encourage the resident to assist you as much as possible.
5. Instruct the resident to turn on his/her back. Assist as necessary.
6. Bring or instruct the resident to bring his or her legs together.
7. Bend or instruct the resident to bend his or her knees slightly to relax the stomach muscles.
8. Reposition the bed covers. Make the resident comfortable.
9. Place the call light within easy reach of the resident.
10. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
11. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

The Side-Lying Position

Level II

Purpose

The purpose of this procedure is to relieve pressure points on the bedfast resident to prevent pressure ulcers. The resident is positioned on his or her side (left or right) with pillows placed under the resident's head, against the back, between the resident's legs to support the weight of the leg and foot, and under the arm to support the weight of the arm.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Raise the height of the bed to a comfortable working level. Unless otherwise instructed, lower the head and footrest of the bed.
3. Lower the side rails on the side of the bed you are working, if up.
4. Avoid unnecessary exposure of the resident's body.
5. Encourage the resident to assist you as much as possible.
6. Turn the resident on his or her side.
7. Position the top leg by bending it at the knee and bringing it to a 90° angle. Keep the bottom leg straight or slightly bent.
8. Place a pillow between the resident's legs to support the weight of the leg and foot.
9. Place a pillow under the top arm. Be sure the bottom arm is placed in a comfortable position.
10. Position a pillow (or pillows) against the resident's back.
11. Place a pillow under the resident's head.
12. When the procedure has been completed, reposition the bed covers. Make the resident comfortable.
13. Reposition the bed to its lowest horizontal position for the safety of the resident.
14. Place the call light within easy reach of the resident.
15. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
16. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.

continues on next page

8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Turning a Resident on His/Her Side Away From You

Level II

Purpose

The purposes of this procedure are to provide comfort to the resident, to prevent skin irritation and breakdown, and to promote good body alignment.

Preparation

Review the resident's care plan to assess for any special needs of the resident.

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Unless otherwise instructed, lower the head and footrest of the bed.
3. Lower the side rails on the side of the bed you are working, if up.
4. Loosen the covers as necessary. Avoid unnecessary exposure of the resident's body.
5. Slide both your arms under the resident's back to his/her far shoulder.
6. Slide the resident's shoulders toward you on your arms. (Note: Keep your knees bent and your back straight as you slide the resident toward you.)
7. Slide both your arms (as far as you can) under the resident's buttocks.
8. Slide the resident's buttocks toward you. (Note: Keep your knees bent and your back straight as you slide the resident's buttocks toward you.)
9. Slide both arms under the resident's feet and ankles.
10. Slide the resident's feet toward you. (Note: Keep your knees bent and your back straight as you slide the resident's feet toward you.)
11. Cross the resident's arms over his/her chest.
12. Cross the resident's leg nearest you over the leg farthest from you.
13. Stand with your weight evenly distributed on both feet. (Note: Your feet should be approximately 12 inches apart.)
14. Keep your back straight.
15. Place one hand on the resident's shoulder nearest you.
16. Place your second hand under the resident's buttocks.
17. Gently turn the resident away from you.
18. Should the resident become weak or faint during the procedure, cease the procedure and summon the staff/charge nurse.
19. Place pillows behind the resident's back to keep his/her body in proper alignment.
20. Support the resident's head with the palm of your hand.
21. With the second hand, position a pillow under the resident's neck and head.
22. Position the resident's arms and legs in a comfortable position and free from pressure.
23. Place a pillow between the resident's knees if this is comfortable to him/her.
24. Reposition the bed covers. Make the resident comfortable.
25. Reposition the bed.
26. Place the call light within easy reach of the resident.

continues on next page

27. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
28. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. The position in which the resident was placed.
4. The reason for changing the resident's position.
5. If and how the resident participated in the procedure or any changes in the resident's ability to participate in the procedure.
6. Any problems or complaints made by the resident related to the procedure.
7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Functional Impairment – Clinical Protocol

Assessment and Recognition

1. Upon admission to the facility, whenever a significant change of condition occurs, and periodically during a resident/patient's stay, the physician and staff will assess the resident/patient's function along with their physical condition.
2. As part of the physical examination, the physician will include items that relate to function as well as potential to benefit from rehabilitative services; for example, proprioception, sensation, muscle tone, range of motion, gait, balance, joint swelling and abnormalities, strength, edema, and cognition.
3. The staff and physician will identify individuals with potential for significant improvement in function or significant decline in function, including the ability to perform activities of daily living (ADLs).

Cause Identification

1. As appropriate, the physician will identify and evaluate medical conditions and medications that impact a resident/patient's function (for example, muscle weakness or pain due to adverse medication effects, persistence of complications from recent hospitalization, and sedation or confusion due to fluid/electrolyte imbalance).
2. The physician and staff will review and analyze the preceding information to evaluate the influence of medical factors on function and vice-versa, to help guide subsequent treatment and care planning.
3. The physician will identify and document the impact of medical conditions on function and identify a resident/patient's potential to benefit from rehabilitative services such as physical and occupational therapy.

Treatment/Management

1. The physician will manage medical issues that affect function, to the extent possible; for example, treat medical conditions or adjust medications causing lethargy, confusion, pain, or weakness.
2. The staff and physician will collaborate to identify a rehabilitative or restorative care plan to help improve function and quality of life and meet a resident/patient's goals and needs and attain other desired outcomes such as discharge to the community.
3. Based on a review of available information (including results of the evaluation), the physician will determine if a resident/patient meets the criteria for skilled therapy services.
4. The physician and staff will address risk factors related to exercise or activity, and consider any relevant precautions.
5. The physician will order any therapy services based on the above considerations.
6. The physician will pay attention to the relevance and effectiveness of such interventions and will not just sign off therapy orders perfunctorily.

continues on next page

Monitoring and Follow-Up

1. The staff will monitor and document the resident/patient’s function (for example, evidence of reduced ADL dependency, improved ambulation, improved balance and gait, etc.) and will discuss this with the physician periodically in conjunction with a discussion of medical interventions and plans of care.
2. The physician will identify the subsequent relevance of therapy services, based on reviewing the resident/patient’s progress relative to his/her care goals (e.g., functional stabilization or improvement) and the status of conditions and the current treatment regimen that have been identified as affecting his/her function.

Surgery-Related (Pre- and Postoperative) Management – Clinical Protocol

Assessment and Recognition

1. As needed, the physician will evaluate a resident who is scheduled to undergo surgery.
 - a. The assessment will focus on pertinent items including a recent medical history, level of cognition and function, controlling active medical co-morbidities (such as congestive heart failure and hypertension), estimating operative risk, identifying a baseline for comparing possible postoperative changes or complications, and identifying significant medication-related risks (for example, stopping anticoagulation or adjusting insulin preoperatively).

Cause Identification

1. The physician will order appropriate preoperative diagnostic tests, as indicated.
 - a. Lab testing will focus on detecting significant, treatable asymptomatic conditions, undetectable by history or exam, that impact surgical risk. Tests should be fairly sensitive and specific; for example, hemoglobin/hematocrit and electrolytes; chest x-ray or blood gases where indicated; and PT/INR in an anticoagulated individual.
2. Operative risk estimation may be based on the American Society of Anesthesiologists classification:
 - a. Class 1: Normal healthy patient
 - b. Class 2: Mild systemic disease
 - c. Class 3: Severe, but not incapacitating, systemic disease
 - d. Class 4: Incapacitating, constantly life-threatening systemic disease
 - e. Class 5: Moribund patient

Treatment/Management

1. As much as possible, the physician will address modifiable risk factors and potentially treatable active medical conditions prior to the individual's transfer for surgery; for example, stabilize blood sugar and blood pressure, correct heart failure, optimize nutritional status, reduce or stop medications that may be problematic while hospitalized, stabilize renal function, etc.
2. Post-operative pain management interventions will be implemented according to the established plan of care.

Monitoring

1. After readmission to the facility postoperatively, the physician and staff will maintain appropriate communication with the referring surgeon to ensure that the resident receives adequate postoperative care and that the staff and Attending Physician receive relevant medical information.
2. The staff and physician will review the continuing relevance of the preoperative medications and treatments, along with those added postoperatively, and adjust them accordingly.
3. The staff will assess the resident for pain and continue to monitor the resident for changes in level of pain.

continues on next page

4. The staff and physician will monitor for, and address, postoperative risks and complications such as infection, deep vein thrombosis, cardiac arrhythmia, bleeding, failure of surgical wounds to heal, urosepsis from indwelling catheters inserted in the hospital, delirium, depression, etc.

Assistive Devices and Equipment

Policy Statement

Our facility maintains and supervises the use of assistive devices and equipment for residents.

Policy Interpretation and Implementation

1. Certain devices and equipment that assist with resident mobility, safety and independence are provided for residents. These may include (but are not limited to):
 - a. specialized eating utensils and equipment;
 - b. safety devices for the bathroom (grab bars, toilet risers, bedside commodes, etc.); and
 - c. mobility devices (wheelchairs, walkers and canes).
2. The facility provides the resident with assistance in locating available resources to obtain assistive devices that are not provided by the facility, including (but not limited to):
 - a. glasses, contact lenses, or magnifying devices; and
 - b. hearing aids, amplifiers, etc.
3. Recommendations for the use of devices and equipment are based on the comprehensive assessment and documented in the resident care plan.
4. Staff and volunteers are trained and demonstrate competency on the use of devices and equipment prior to assisting or supervising residents.
5. Residents, family and visitors are trained, as indicated, on the safe use of equipment and devices.
6. The following factors are addressed to the extent possible to decrease the risk of avoidable accidents associated with devices and equipment.
 - a. Appropriateness for resident condition – the resident is assessed for lower extremity strength, range of motion, balance and cognitive abilities when determining the safest use of devices and equipment.
 - b. Personal fit – the equipment or device is used only according to its intended purpose and is measured to fit the resident’s size and weight.
 - c. Device condition – devices and equipment are maintained on schedule and according to manufacturer’s instructions. Defective or worn devices are discarded or repaired.
 - d. Staff practices – staff are required to demonstrate competency on the use of devices and equipment and are available to assist and supervise residents as needed.
7. If residents provide their own assistive devices, these items are documented as personal property and made available for that resident’s use only.
8. Equipment maintained for the general use of all residents are not permanently assigned to any resident.
9. Requests or the need for special equipment are referred to the social services department.

Resident Mobility and Range of Motion

Policy Statement

1. Residents will not experience an avoidable reduction in range of motion (ROM).
2. Residents with limited range of motion will receive treatment and services to increase and/or prevent a further decrease in ROM.
3. Residents with limited mobility will receive appropriate services, equipment and assistance to maintain or improve mobility unless reduction in mobility is unavoidable.

Policy Interpretation and Implementation

1. As part of the resident's comprehensive assessment, the nurse will identify the resident's:
 - a. current range of motion of his or her joints;
 - b. current mobility status (per current MDS assessment tool), including his or her ability to:
 - (1) move to and from the lying position;
 - (2) turn and move side-to-side in bed;
 - (3) change body positions;
 - (4) transfer to and from bed or chair; and
 - (5) walk.
 - c. limitations in movement or mobility;
 - d. opportunities for improvement; and
 - e. previous treatment and services for mobility.
2. As part of the comprehensive assessment, the nurse will also identify conditions that place the resident at risk for complications related to ROM and mobility, including:
 - a. pain;
 - b. skin integrity issues;
 - c. muscle wasting and atrophy;
 - d. gait and balance issues that may lead to falls or fractures;
 - e. contractures; or
 - f. other complications that could cause or contribute to immobility, impaired ROM or injury from falls (i.e., postural hypotension, urinary incontinence, etc.).
3. During the resident's assessment, the nurse will identify the underlying factors that contribute to his or range of motion or mobility problems, if any, including:
 - a. immobilization (bedfast, chair or wheelchair usage);
 - b. neurological conditions (e.g., cerebral palsy, cerebral-vascular accident, etc.);
 - c. conditions in which movement may lead to pain; and/or
 - d. conditions that limit or immobilize movement of limbs or digits (e.g., splints).
4. The care plan will be developed by the interdisciplinary team based on the comprehensive assessment, and will be revised as needed.
5. The care plan will include specific interventions, exercises and therapies to maintain, prevent avoidable decline in, and/or improve mobility and range of motion.

continues on next page

6. Interventions may include therapies, the provision of necessary equipment, and/or exercises and will be based on professional standards of practice and be consistent with state laws and practice acts.
7. The care plan will include the type, frequency, and duration of interventions, as well as measurable goals and objectives. The resident and representative will be included in determining these goals and objectives.
8. Documentation of the resident’s progress toward the goals and objectives will include attempts to address any changes or decline in the resident’s condition or needs.

Restorative Nursing Services

Policy Statement

Residents will receive restorative nursing care as needed to help promote optimal safety and independence.

Policy Interpretation and Implementation

1. Restorative nursing care consists of nursing interventions that may or may not be accompanied by formalized rehabilitative services (e.g., physical, occupational or speech therapies).
2. Residents may be started on a restorative nursing program upon admission, during the course of stay or when discharged from rehabilitative care.
3. Restorative goals and objectives are individualized and resident-centered, and are outlined in the resident's plan of care.
4. The resident or representative will be included in determining goals and the plan of care.
5. Restorative goals may include, but are not limited to supporting and assisting the resident in:
 - a. adjusting or adapting to changing abilities;
 - b. developing, maintaining or strengthening his/her physiological and psychological resources;
 - c. maintaining his/her dignity, independence and self-esteem; and
 - d. participating in the development and implementation of his/her plan of care.

Scheduling Therapy Services

Policy Statement

Therapy services shall be scheduled in accordance with the resident’s treatment plan.

Policy Interpretation and Implementation

1. The therapist shall interview the resident and consult with the attending physician as to the type of treatment to be administered.
2. Therapy is scheduled in coordination with nursing service and is documented in the resident’s medical records.
3. A listing of residents receiving therapy is posted at each nurses’ station. The listing contains:
 - a. the name of the resident;
 - b. the room number of the resident;
 - c. the type of therapy scheduled;
 - d. the time therapy is scheduled;
 - e. where therapy is scheduled (resident’s room, recreation area, etc.);
 - f. the name of the resident’s attending physician; and
 - g. other information as necessary or appropriate.
4. Nursing service shall be responsible for preparing and escorting the resident to the therapy area unless such treatment is scheduled in the resident’s room.

Range of Motion Exercises

Level II

Purpose

The purpose of this procedure is to exercise the resident's joints and muscles.

Preparation

1. Verify that there is a physician's order for this procedure. If there is no order for treatment, contact the attending physician to obtain treatment orders. (Note: Document the receipt of telephone orders in the resident's medical record.)
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Be gentle with the resident. Do not rush the procedure.
2. If the resident becomes weak, or complains of pain, cease the exercise and summon the staff/charge nurse.
3. Support the extremity at the joint as it is being exercised.
4. Move each joint through its range of motion three (3) times unless otherwise instructed.
5. Move each joint gently, smoothly and slowly through its range of motion.
6. Remember to stop an exercise before the point of pain.

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. If the resident is bedfast, position the resident in the supine position. If permitted, remove the pillow.
3. Loosen the top covers as necessary. Avoid unnecessary exposure of the resident's body.
4. Lower the side rails on the side of the bed you are working, if up.
5. If the resident is in a chair, instruct the resident to slide back into the chair so that his or her back is against the chair. Position the resident's head in a normal upright position.

To Exercise the Neck:

1. If ROM exercise is passive, you will need to support the resident's neck with your hands over the resident's ears.
2. Turn the head to the right.
3. Turn the head to the left.
4. Bend the head to the right.
5. Bend the head to the left.
6. Tilt the head to the back.
7. Bend the head down.
8. Return the head to an upright position.
9. Unless otherwise instructed, repeat this step three (3) times.

To Exercise the Shoulder:

1. If ROM exercise is passive, you will need to support the resident's arm at the elbow and wrist.
2. Place one hand on the resident's elbow to keep it straight.

continues on next page

3. Place your second hand in the resident's hand.
4. Keeping the elbow straight, gently lift the resident's arm up until the resident's hand is pointing toward the ceiling.
5. Gently, lower the arm down to the resident's side.
6. Unless otherwise specified, repeat this step three (3) times.
7. Keeping the elbow straight, gently move the resident's arm away from the body and toward you.
8. Next, move the arm back to the resident's side.
9. Unless otherwise instructed, repeat this step three (3) times.
10. Repeat steps 1 through 9 for the second shoulder.

To Exercise the Elbow:

1. If ROM exercise is passive, you will need to support the resident's arm at the wrist and elbow.
2. Position the hand with the palm facing up.
3. Bend the elbow by moving the hand toward the shoulder.
4. Bring the arm down to the starting position.
5. Make a fist.
6. Rotate the fist to the left and then to the right.
7. Unless otherwise instructed, repeat the step three (3) times.
8. Repeat steps 1 through 7 for the second elbow.

To Exercise the Wrist:

1. If ROM exercise is passive, you will need to support the resident's arm and hand.
2. Position the hand with the palm facing up.
3. Bend the elbow by moving the hand toward the shoulder.
4. Bend the hand down.
5. Straighten the hand up.
6. Bend the hand back.
7. Straighten the hand up.
8. Turn the hand toward the thumb.
9. Turn the hand toward the little finger.
10. Return to the starting position.
11. Unless otherwise instructed repeat this step three (3) times.
12. Repeat steps 1 through 11 for the second wrist.

To Exercise the Thumb and Fingers:

1. If ROM exercise is passive, you will need to support the resident's wrist and arm.
2. Move the arm outward from the resident's side toward you.
3. Bend the elbow so that the resident's hand is pointing toward the ceiling.
4. Hold the resident's wrist with one hand.
5. Instruct the resident to open his or her hand keeping the fingers together and extending the thumb outward.
6. Place your second hand behind the resident's hand for support. (Note: This hand should be the same hand as the resident's and should be directly behind or touching the resident's hand.)
7. Bend the thumb forward inside the palm to the small finger.
8. Bend the fingers over the top of the thumb.
9. Raise the fingers up to the starting position.
10. Spread the fingers and thumb apart.

continues on next page

11. Touch the thumb to each finger.
12. Keep the fingers together and extend the thumb outward. (Note: This is the starting position.)
13. Unless otherwise instructed, repeat this procedure three (3) times.
14. Repeat steps 1 through 14 for the second hand.

To Exercise the Hip and Knee:

1. If ROM exercise is passive, you will need to support the resident's leg and ankle.
2. Fanfold the bottom of the blanket back to the mid thighs.
3. Slide one hand under the knee--palm up.
4. Slide the second hand under the ankle--palm up.
5. Lift the leg, bending it at the knee.
6. Move the knee backward toward the resident as far as possible.
7. Bring the knee down to a position where it is pointing to the ceiling.
8. Turn the leg **outward** by rotating the foot toward you.
9. Rotate the foot back in and extend (straighten) the leg.
10. Bring the leg down to a point where it almost touches the bed.
11. Turn the leg **inward** by rotating the foot inward and crossing the legs at the ankles.
12. Bring the leg back toward you, straightening the leg and foot.
13. Lower the leg on the bed.
14. Allow the resident to rest for a moment.
15. Unless otherwise instructed, repeat this procedure three (3) times.
16. Repeat steps 1 through 15 for the second leg.

To Exercise the Feet and Toes:

1. If ROM exercise is passive, you will need to support the resident's foot.
2. Fanfold the bottom of the blanket back to the knees.
3. Position one hand on top of the resident's foot. (**Note:** Your fingers should be under the foot, palm on the arch and thumb over the top of the foot.)
4. With the second hand, grasp the top of the toes.
5. Gently curl the toes down.
6. Straighten the toes.
7. Gently curl the toes backward.
8. Straighten the toes.
9. Beginning with the big toe, move each toe away from the next toe.
10. Beginning with the little toe, move each toe toward the little toe.
11. Unless otherwise instructed, repeat this procedure three (3) times.
12. Repeat steps 1 through 11 for the second foot.

When Exercises are Complete

1. Reposition the bed covers. Make the resident comfortable.
2. If a blanket was used to cover the resident, remove the blanket and store it in its designated storage area.
3. Place the call light within easy reach of the resident.
4. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
5. Wash and dry your hands thoroughly.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time that the exercises were performed.
2. The name and title of the individual(s) who performed the procedure.
3. The type of ROM exercise given.
4. Whether the exercise was active or passive.
5. How long the exercise was conducted.
6. If and how the resident participated in the procedure or any changes in the resident’s ability to participate in the procedure.
7. Any problems or complaints made by the resident related to the procedure.
8. If the resident refused the treatment, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the exercises.
2. Report other information in accordance with facility policy and professional standards of practice.

Speech Therapy

Level III

Purpose

The purpose of this procedure is to identify, assess and treat speech and language problems including swallowing disorders.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Speech therapists treat stroke survivors and other brain injury survivors who experience impaired ability to swallow or have difficulty expressing thought or understanding language. These residents may experience:
 - a. Aphasia—*Expressive aphasia* is a problem with what to say. *Receptive aphasia* is a problem with understanding what has been said.
 - b. Anomia—a word finding problem.
 - c. Dysarthria—muscles of the lips, tongue and other body parts used for speech are weaker than normal.
 - d. Dysphagia—difficulty in chewing or swallowing.
 - e. Apraxia—a disorder of the nervous system that affects the ability to sequence and say sounds, syllables and words.
2. The speech therapist works with other rehabilitation and medical professionals and families to provide a comprehensive evaluation and treatment plan for residents with any of the problems in speech listed in paragraph one (1) above.
3. Communicating with the elderly will sometimes require extra time and patience due to physical, psychological and social changes of normal aging.

Speech and Language Evaluation

The speech therapist completes an evaluation of the following speech and language skills:

1. Fluency, vocal quality and loudness, and the pronunciation and clarity of speech.
2. Strength and coordination of the speech muscles.
3. Understanding and use of vocabulary (semantics) and understanding and use of grammar (syntax).
4. Understanding and answering both yes/no and *Who, What, When, Where, How* questions (e.g., What do you do with a hammer?).
5. Understanding extended speech. The resident listens to a short story or factual passage and answers fact-based (the answers are in the passage) and inferential (the resident must arrive at a conclusion based on information gathered from the reading) questions about the material.
6. Ability to follow directions that increase in both length and complexity.
7. Ability to tell an extended story (language sample), both verbal and written form.
8. Ability to describe the “plot” in an action picture.
9. Coherence of narrative.
10. Ability to recall words he/she needs to express ideas.
11. Expression of thoughts (complete sentences, telegraphic sentences or phrases, or single words).

continues on next page

12. Clarity of speech (slurred speech/difficult to understand or intelligible).
13. Social communication skills (pragmatic language).
14. Ability to interpret or explain jokes, sarcastic comments, absurdities in stories or pictures (e.g., what is strange about a person using an umbrella on a sunny day?).
15. Proficiency with initiating conversation and conversational topics, taking turns during a discussion, and expressing thoughts clearly using a variety of words and grammatical constructions.
16. Ability to clarify communication when his/her conversational partner does not understand.
17. Ability to read and write letters, words, phrases, sentences and paragraphs. The speech therapist may look at the quality of the language expression, accuracy of spelling, and letter formation and spacing of words and letters on the page (to identify or rule out possible movement and/or visual-perceptual difficulties).
18. Ability to swallow.
19. Ability to use an alternative communication aid (as needed).

Speech Therapy Treatment

1. The speech therapist works on drills and exercises to improve specific language skills affected by damage to the brain (e.g., the resident may practice naming objects, following directions, answering questions about stories, etc.). These exercises vary depending on the resident's needs.
2. The speech therapist teaches the resident ways to make use of stronger language skills to compensate for weaker language skills. (e.g., Some residents may find it easier to express their ideas through gestures and writing than with speaking. The speech therapist may teach this resident to use both writing and gestures to help remember words for conversation.)
3. The speech therapist uses a communication board to help the resident who cannot speak to express his/her ideas.
4. If there is weakness of speech muscles, the speech therapist teaches exercises to strengthen these muscles.
5. Before you begin your conversation, reduce background noises that may be distracting (turn off the television or radio, close the door, etc.).
6. Begin conversation with casual topics (e.g., weather).
7. Continue conversation with familiar subjects such as family members.
8. Be consistent with the topic of conversation. Avoid quick shifts from topic to topic.
9. Keep your sentences and questions short.
10. Allow extra time for responding. Don't rush the resident.
11. Be an active listener.
12. After your visit, tell others who visit (family members, physicians, nurses, aides, etc.) what you've learned to improve communication with the resident.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the speech therapy was provided.
2. The name and title of the individual(s) who provided the speech therapy.
3. All assessment data obtained during the speech therapy.
4. If the resident refused the therapy, the reason(s) why and the intervention taken.
5. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the speech therapy.
2. Report other information in accordance with facility policy and professional standards of practice.

Abuse and Neglect – Clinical Protocol

1. “**Abuse**” is defined at §483.5 as “the willful infliction of injury, unreasonable confinement, intimidation, or punishment with resulting physical harm, pain or mental anguish. Abuse also includes the deprivation by an individual, including a caretaker, of goods or services that are necessary to attain or maintain physical, mental, and psychosocial well-being. Instances of abuse of all residents, irrespective of any mental or physical condition, cause physical harm, pain or mental anguish. It includes verbal abuse, sexual abuse, physical abuse, and mental abuse including abuse facilitated or enabled through the use of technology.”
2. “**Neglect**,” as defined at §483.5, means “the failure of the facility, its employees or service providers to provide goods and services to a resident that are necessary to avoid physical harm, pain, mental anguish or emotional distress.”
3. “**Sexual abuse**” is defined at §483.5 as “non-consensual sexual contact of any type with a resident.”
4. “**Willful**,” as defined at §483.5 and as used in the definition of “abuse,” means “the individual must have acted deliberately, not that the individual must have intended to inflict injury or harm.”

Assessment and Recognition

1. The nurse will assess the individual and document related findings. Assessment data will include:
 - a. Injury assessment (bleeding, bruising deformity, swelling etc.);
 - b. Pain assessment;
 - c. Current behavior;
 - d. Patient’s age and sex;
 - e. All current medications, especially anticoagulants, NSAIDs, salicylate;
 - f. Other platelet inhibitors;
 - g. Vital signs;
 - h. Behavior over last 24 hours (bruise could be related to movement disorder or aggressive behavior);
 - i. History of any tendency towards bruising;
 - j. All active diagnoses; and
 - k. Any recent labs.
2. The nurse will report findings to the physician. As needed, the physician will assess the resident/patient to verify or clarify such findings, especially if the cause or source of the problem is unclear.
3. The physician will help identify individuals with a history of having been abused or neglected, or those showing evidence of possible abuse or neglect; for example, someone admitted from home or the hospital with multiple pressure ulcers and severe under-nutrition.
4. The physician and staff will help identify risk factors for abuse within the facility; for example, significant numbers of residents/patients with unmanaged problematic behavior; significant injuries in physically dependent individuals; problematic family relationships; issues related to staff knowledge and skill; or performance that might affect resident care.

continues on next page

5. Along with staff and management, the physician will help identify situations that might constitute or could be construed as neglect; for example, inadequate prevention or care of pressure ulcers, inattention to advance directives and resident wishes, inappropriate management of problematic behavior, recurrent failure to provide incontinence care, failure to report or evaluate significant weight loss, repeated failure to check for correct application of restraints, etc.
 - a. As indicated, the physician will evaluate the resident or refer him or her for evaluation; for example, to rule out sexual assault or fracture, or to assess the possible causes of bruises.

Cause Identification

1. The staff, with the physician's input as needed, will investigate alleged abuse and neglect to clarify what happened and identify possible causes.
2. The physician will provide adequate documentation regarding significant negative outcomes that have resulted from a resident's underlying medical illnesses or conditions, despite appropriate care.

Treatment/Management

1. The facility management and staff will institute measures to address the needs of residents and minimize the possibility of abuse and neglect.
2. The management and staff, with physician support, will address situations of suspected or identified abuse and report them in a timely manner to appropriate agencies, consistent with applicable laws and regulations.
3. The physician will order measures required to address the consequences of an abuse situation, such as psychological evaluation or suturing of a laceration.
4. The physician and staff will address appropriately causes of problematic resident behavior where possible, such as mania, psychosis, and medication side effects.

Monitoring and Follow-Up

1. The staff and physician will monitor individuals who have been abused to address any issues regarding their medical condition, mood, and function.
2. The medical director will advise facility management and staff about ways to ensure that basic medical, functional, and psychosocial needs are being met and that potentially preventable or treatable conditions affecting function and quality of life are addressed appropriately.
3. The physician will advise the facility and help review and address abuse and neglect issues as part of the quality assurance process.

Resident Rights Guidelines for All Nursing Procedures

Purpose

To provide general guidelines for resident rights while caring for the resident.

Preparation

1. Prior to having direct-care responsibilities for residents, staff must have appropriate in-service training on resident rights, including:
 - a. Preventing, recognizing and reporting resident abuse;
 - b. Resident dignity and respect;
 - c. Resident notification of rights, services, and health/medical condition;
 - d. Protection of resident funds and personal property;
 - e. Confidentiality of protected health information;
 - f. Resident right of refusal (medications and treatments);
 - g. Use of restraints;
 - h. Resident freedom of choice;
 - i. Resident/Family participation in care planning;
 - j. Resident access to information; and
 - k. Visitation.

General Guidelines

1. For any procedure that involves direct resident care, follow these steps:
 - a. Knock and gain permission before entering the resident's room.
 - b. If the resident is sleeping, and the procedure is not urgent or scheduled, return when the resident is awake.
 - c. Verify the identity of the resident.
 - d. Introduce yourself to the resident if he/she is unfamiliar with you, or if he/she may not recognize you due to memory loss.
 - e. If visitors are present, ask them to wait outside unless the resident requests that they remain in the room.
 - f. Close the room entrance door and provide for the resident's privacy.
 - g. Explain the procedure to the resident. Answer any questions he/she may have.
 - h. Ask permission to implement the procedure. If the resident refuses, notify your supervisor.
 - i. If permission is obtained, proceed with the procedure.
 - j. Upon completing the procedure, place the side rails in the appropriate position as indicated in the plan of care.

Abuse Investigation and Reporting

Policy Statement

All reports of resident abuse, neglect, exploitation, misappropriation of resident property, mistreatment and/or injuries of unknown source (“abuse”) shall be promptly reported to local, state and federal agencies (as defined by current regulations) and thoroughly investigated by facility management. Findings of abuse investigations will also be reported.

Policy Interpretation and Implementation

Role of the Administrator:

1. If an incident or suspected incident of resident abuse, mistreatment, neglect or injury of unknown source is reported, the administrator will assign the investigation to an appropriate individual.
2. The administrator will provide any supporting documents relative to the alleged incident to the person in charge of the investigation.
3. The administrator will keep the resident and his/her representative (sponsor) informed of the progress of the investigation.
4. The administrator will suspend immediately any employee who has been accused of resident abuse, pending the outcome of the investigation.
5. The administrator will ensure that any further potential abuse, neglect exploitation or mistreatment is prevented.
6. The administrator will inform the resident and his/her representative of the status of the investigation and measures taken to protect the safety and privacy of the resident.

Role of the Investigator:

1. The individual conducting the investigation will, as a minimum:
 - a. review the completed documentation forms;
 - b. review the resident’s medical record to determine events leading up to the incident;
 - c. interview the person(s) reporting the incident;
 - d. interview any witnesses to the incident;
 - e. interview the resident (as medically appropriate);
 - f. interview the resident’s attending physician as needed to determine the resident’s current level of cognitive function and medical condition;
 - g. interview staff members (on all shifts) who have had contact with the resident during the period of the alleged incident;
 - h. interview the resident’s roommate, family members, and visitors;
 - i. interview other residents to whom the accused employee provides care or services; and
 - j. review all events leading up to the alleged incident.
2. The following guidelines will be used when conducting interviews:
 - a. Each interview will be conducted separately and in a private location.

continues on next page

- b. The purpose and confidentiality of the interview will be explained thoroughly to each person involved in the interview process.
 - c. Should a person disclose information that may be self-incriminating, that individual will be informed of his/her rights to terminate the interview until such time as his/her rights are protected (e.g., representation by legal counsel).
 - d. Witness reports will be obtained in writing. Either the witness will write his/her statement and sign and date it, or the investigator may obtain a statement, read it back to the member and have him/her sign and date it.
3. The investigator will notify the ombudsman that an abuse investigation is being conducted. The ombudsman will be invited to participate in the review process.
 - a. If the ombudsman declines the invitation to participate in the investigation, that information will be noted in the investigation record. The ombudsman will be notified of the results of the investigation as well as any corrective measures taken.
 4. The investigator will consult daily with the administrator concerning the progress/findings of the investigation.
 5. Upon conclusion of the investigation, the investigator will record the results of the investigation on approved documentation forms and provide the completed documentation to the administrator.

Reporting

1. All alleged violations involving abuse, neglect, exploitation, or mistreatment, including injuries of an unknown source and misappropriation of property will be reported by the facility administrator, or his/her designee, to the following persons or agencies:
 - a. The State licensing/certification agency responsible for surveying/licensing the facility;
 - b. The local/State Ombudsman;
 - c. The Resident's Representative (Sponsor) of Record;
 - d. Adult Protective Services (where state law provides jurisdiction in long-term care);
 - e. Law enforcement officials;
 - f. The resident's attending physician; and
 - g. The facility medical director.
2. An alleged violation of abuse, neglect, exploitation or mistreatment (including injuries of unknown source and misappropriation of resident property) will be reported immediately, but not later than:
 - a. two (2) hours if the alleged violation involves abuse OR has resulted in serious bodily injury; or
 - b. twenty-four (24) hours if the alleged violation does not involve abuse AND has not resulted in serious bodily injury.
3. Verbal/written notices to agencies may be submitted via special carrier, fax, e-mail, or by telephone.
4. Notices will include, as appropriate:
 - a. the name of the resident;
 - b. the number of the room in which the resident resides;
 - c. the type of abuse that was committed (i.e., verbal, physical, sexual, neglect, etc.);
 - d. the date and time the alleged incident occurred;
 - e. the name(s) of all persons involved in the alleged incident; and
 - f. what immediate action was taken by the facility.

continues on next page

5. The administrator, or his/her designee, will provide the appropriate agencies or individuals listed above with a written report of the findings of the investigation within five (5) working days of the occurrence of the incident.
6. If the investigation reveals findings of abuse, such findings will be reported to the State Abuse Registry.
7. The State Abuse Registry will:
 - a. notify the employee when he/she has been implicated in any investigation;
 - b. inform the employee of the nature of the allegation;
 - c. inform the employee of the time and date of occurrence;
 - d. inform the employee of his/her right to a hearing;
 - e. inform the employee of the state's intent to record findings of resident abuse into the abuse registry; and
 - f. inform the employee of his/her right to file a statement disputing the allegation.
8. If the investigation reveals that the allegation(s) of abuse are founded, the employee(s) will be terminated.
9. If the investigation reveals that the allegation(s) of abuse are unfounded, the employee(s) will be reinstated to his/her/their former position with back pay.
10. Any allegations of abuse will be filed in the accused employee's personnel record along with any statement by the employee disputing the allegation, if the employee chooses to make one. Records concerning unfounded allegations will be destroyed.
11. Appropriate professional and licensing boards will be notified when an employee is found to have committed abuse.
12. The resident and/or representative will be notified of the outcome immediately upon conclusion of the investigation.

Abuse Prevention Program

Policy Statement

Our residents have the right to be free from abuse, neglect, misappropriation of resident property and exploitation. This includes but is not limited to freedom from corporal punishment, involuntary seclusion, verbal, mental, sexual or physical abuse, and physical or chemical restraint not required to treat the resident's symptoms.

Policy Interpretation and Implementation

As part of the resident abuse prevention, the administration will:

1. Protect our residents from abuse by anyone including, but not necessarily limited to: facility staff, other residents, consultants, volunteers, staff from other agencies, family members, legal representatives, friends, visitors, or any other individual.
2. Conduct employee background checks and will not knowingly employ or otherwise engage any individual who has:
 - a. been found guilty of abuse, neglect, exploitation, misappropriation of property, or mistreatment by a court of law;
 - b. had a finding entered into the State nurse aide registry concerning abuse, neglect, exploitation, mistreatment of residents or misappropriation of their property; or
 - c. a disciplinary action in effect against his or her professional license by a state licensure body as a result of a finding of abuse, neglect, exploitation, mistreatment of residents or misappropriation of resident property.
3. Develop and implement policies and procedures to aid our facility in preventing abuse, neglect, or mistreatment of our residents.
4. Require staff training/orientation programs that include such topics as abuse prevention, identification and reporting of abuse, stress management, and handling verbally or physically aggressive resident behavior.
5. Implement measures to address factors that may lead to abusive situations, for example:
 - a. provide staff with opportunities to express challenges related to their job and work environment without reprimand or retaliation;
 - b. instruct staff regarding appropriate ways to address interpersonal conflicts; and
 - c. help staff understand how cultural, religious and ethnic differences can lead to misunderstanding and conflicts.
6. Identify and assess all possible incidents of abuse.
7. Investigate and report any allegations of abuse within timeframes as required by federal requirements.
8. Protect residents during abuse investigations.
9. Establish and implement a QAPI review and analysis of abuse incidents; and implement changes to prevent future occurrences of abuse.
10. Involve the resident council in monitoring and evaluating the facility's abuse prevention program.

Accommodation of Needs

Policy Statement

Our facility's environment and staff behaviors are directed toward assisting the resident in maintaining and/or achieving safe independent functioning, dignity and well-being.

Policy Interpretation and Implementation

1. The resident's individual needs and preferences will be accommodated to the extent possible, except when the health and safety of the individual or other residents would be endangered.
2. The resident's individual needs and preferences, including the need for adaptive devices and modifications to the physical environment, shall be evaluated upon admission and reviewed on an ongoing basis.
3. In order to accommodate individual needs and preferences, adaptations may be made to the physical environment, including the resident's bedroom and bathroom, as well as the common areas in the facility. Examples of such adaptations may include:
 - a. providing access to assistive devices, such as grab bars and toilet risers in the bathroom;
 - b. installing mirrors at a height at which a wheelchair-bound resident can see;
 - c. labeling toiletry items with large print so a visually impaired resident can distinguish one from another;
 - d. installing adaptive handles or providing assistive devices so that drawers are easily opened and closed;
 - e. installing longer cords or providing remote controlled overhead or task lighting so that they are easily accessible;
 - f. moving furniture or large items in rooms and common areas that may obstruct the path of a resident using a walker;
 - g. providing a variety of types (for example, chairs with and without arms), sizes (height and depth), and firmness of furniture in rooms and common areas so that residents with varying degrees of strength and mobility can independently arise to a standing position; and/or
 - h. arranging furniture as the resident requests, providing the arrangement is safe, his or her roommate agrees and space allows.
4. In order to accommodate individual needs and preferences, staff attitudes and behaviors must be directed towards assisting the residents in maintaining independence, dignity and well-being to the extent possible and in accordance with the residents' wishes.
 - a. Staff will interact with the residents in a way that accommodates the physical or sensory limitations of the residents, promotes communication, and maintains dignity. (For example, staff shall face the resident and speak to him or her at eye level if the resident is hearing impaired and can read lips.)
 - b. Staff will arrange toiletries and personal items so that they are in easy reach of the resident.
 - c. Staff will help to keep hearing aids, glasses and other adaptive devices clean and in working order for the resident.

Choice of Attending Physician

Policy Statement

The resident has the right to choose his or her own attending physician.

Policy Interpretation and Implementation

1. Residents are not required to choose an attending physician.
2. A physician selected by the resident is not obligated to provide services to the resident.
3. The facility may not interfere with the process by which the resident chooses his or her physician.
4. The resident is informed in writing of the name and contact information for his or her attending physician:
 - a. during the admission process;
 - b. any time the information changes; and
 - c. upon the resident's/representative's request.
5. If the resident subsequently chooses another attending physician who meets the requirements and responsibilities of an attending physician, the facility will honor that choice.
6. The attending physician must be:
 - a. licensed to practice medicine in the state where the resident resides;
 - b. willing to provide services for the resident at this facility; and
 - c. able to fulfill his or her responsibilities as an attending physician.
7. The attending physician requirements and responsibilities include:
 - a. participating in the resident assessments and care planning;
 - b. monitoring changes in the resident's medical status;
 - c. providing consultation or treatment when called by the facility;
 - d. overseeing the plan of care;
 - e. prescribing an appropriate medical regimen;
 - f. providing timely information about the resident's condition and medical needs to the resident, representative and interdisciplinary team;
 - g. visiting the resident at appropriate intervals; and
 - h. ensuring adequate alternative coverage.
8. The medical director identifies attending physician qualifications and additional responsibilities, based on clinical and regulatory requirements and the recommendations of relevant professional associations.
9. If the resident (or representative) declines to choose an attending physician, or if the resident's chosen physician fails to fulfill his or her responsibilities, the facility may choose another physician to oversee medical care of the resident after informing the resident or representative.
 - a. The facility informs the resident if it is determined that the physician chosen by the resident is unable or unwilling to meet the requirements and responsibilities of an attending physician.
 - b. The facility discusses the alternate physician choice(s) with the resident or representative and honors the resident's preferences, if any.

continues on next page

10. If it is a condition for admission to choose a personal physician among those who have practice privileges at the facility (e.g. a nursing home within a CCRC), this is still considered honoring resident choice.
11. Physician orders and progress notes are maintained in accordance with current OBRA regulations and facility policy.
12. Physician visits, frequency of visits, emergency care of residents, etc., are provided in accordance with current OBRA regulations and facility policy.
13. Consultative services are made available from community-based consultants or from a local hospital or medical center.

Confidentiality of Information and Personal Privacy

Policy Statement

Our facility will protect and safeguard resident confidentiality and personal privacy.

Policy Interpretation and Implementation

1. The facility will safeguard the personal privacy and confidentiality of all resident personal and medical records.
2. The facility will strive to protect the resident's privacy regarding his or her:
 - a. accommodations;
 - b. medical treatment;
 - c. written and telephone communications;
 - d. personal care;
 - e. visits; and
 - f. family and resident group meetings.
3. Providing a private room for each resident is not required to maintain or protect resident privacy.
4. Access to resident personal and medical records will be limited to authorized staff and business associates.
5. Representatives of state and federal regulatory agencies may have access to resident information without the resident's consent.
6. Only authorized staff and business associates will have access to resident financial data.
7. Release of resident information, including video, audio, or computer stored information, will be handled in accordance with resident rights and privacy policies.
8. Residents may initiate a request to release information contained in their records and charts to themselves or anyone they wish. Such requests will be honored only upon the receipt of a written, signed, and dated request from the resident or representative (sponsor).
9. Residents may refuse a request for the release of (and the facility must keep confidential) medical and personal records, unless the release is required by law or:
 - a. for treatment, payment or health care operations (see 45 CFR 164.506);
 - b. for public health activities;
 - c. for the reporting of abuse, neglect or domestic violence;
 - d. for health oversight activities;
 - e. for judicial or administrative proceedings;
 - f. for law enforcement purposes;
 - g. for organ donation purposes;
 - h. for research purposes;
 - i. to coroners, medical examiners, or funeral directors; or
 - j. to avert a serious threat to health or safety (see 45 CFR 164.512).

continues on next page

10. If the resident is transferred to another facility, medical information pertaining to the resident's treatment, plan of care, diagnosis, etc., will be released to the other facility in accordance with current transfer/discharge requirements.

Dignity

Policy Statement

Each resident shall be cared for in a manner that promotes and enhances his or her sense of well-being, level of satisfaction with life, and feelings of self-worth and self-esteem.

Policy Interpretation and Implementation

1. Residents are treated with dignity and respect at all times.
2. The facility culture supports dignity and respect for residents by honoring resident goals, choices, preferences, values and beliefs. This begins with the initial admission and continues throughout the resident's facility stay.
3. Individual needs and preferences of the resident are identified through the assessment process.
4. Residents may exercise their rights without interference, coercion, discrimination or reprisal from any person or entity associated with this facility.
5. When assisting with care, residents are supported in exercising their rights. For example, residents are:
 - a. groomed as they wish to be groomed (hair styles, nails, facial hair, etc.);
 - b. encouraged to attend the activities of their choice, including religious, political, civic, recreational, or social activities;
 - c. encouraged to dress in clothing that they prefer;
 - d. allowed to choose when to sleep, eat and conduct activities of daily living; and
 - e. provided with a dignified dining experience.
6. Residents' private space and property are respected at all times. Staff do not handle or move a resident's personal belongings without the resident's permission.
7. Staff are expected to knock and request permission before entering residents' rooms.
8. Staff speak respectfully to residents at all times, including addressing the resident by his or her name of choice and not "labeling" or referring to the resident by his or her room number, diagnosis, or care needs.
9. Staff inform and orient residents to their environment. Procedures are explained before they are performed and residents will be told in advance if they are going to be taken out of their usual or familiar surroundings.
10. Staff protect confidential clinical information. Examples include the following:
 - a. Verbal staff-to-staff communication (e.g., change of shift reports) are conducted outside the hearing range of residents and the public.
 - b. Signs indicating the resident's clinical status or care needs are not openly posted in the resident's room unless specifically requested by the resident or family member. Discreet posting of important clinical information for safety reasons is permissible (e.g., taped to the inside of the closet door).
 - c. In the interest of public health, posting the resident's isolation status or transmission-based precautions is permissible as long as the type of infection remains confidential.
 - d. The display of the resident's name on the door or the presence of memorabilia among the resident's belongings is not considered a violation of the resident's privacy or dignity.

continues on next page

11. Staff promote, maintain and protect resident privacy, including bodily privacy during assistance with personal care and during treatment procedures.
12. Demeaning practices and standards of care that compromise dignity are prohibited. Staff are expected to promote dignity and assist residents; for example:
 - a. helping the resident to keep urinary catheter bags covered;
 - b. promptly responding to a resident’s request for toileting assistance; and
 - c. allowing residents unrestricted access to common areas open to the public, unless this poses a safety risk for the resident.
13. Staff are expected to treat cognitively impaired residents with dignity and sensitivity; for example:
 - a. addressing the underlying motives or root causes for behavior; and
 - b. not challenging or contradicting the resident’s beliefs or statements.

Experimental Research

Policy Statement

Residents have the right to participate in or refuse to participate in experimental research.

Policy Interpretation and Implementation

1. Residents may participate in or refuse to participate in any experimental research. (Note: Collective resident statistics that do not identify individual residents may be used for studies without obtaining residents' permission.)
2. "Experimental Research" is defined as the development, testing and use of a clinical treatment, such as an investigational drug or therapy that has not yet been approved by the FDA or medical community as effective and conforming to accepted medical practice.
3. Any resident being considered for participation in experimental research must be fully informed (in writing, by the researcher) of:
 - a. the nature of the research (i.e., medication, treatment, etc.);
 - b. the potential benefits of the experiment; and
 - c. the risks or possible consequences of the experiment.
4. Residents will be informed specifically of their rights to agree or decline to participate in experimental research, or to withdraw consent to participate at any time.
5. When the resident lacks decision-making capacity, an appropriate substitute decision-maker may exercise the resident's right to participate or to refuse, based on careful consideration of the resident's best interests.
6. Any experimental research involving residents of the facility will be subject to prior approval of the administrator and board of directors, and to oversight by a committee established specifically for this purpose.
7. The facility staff and physician will monitor for, and identify, situations where the resident may be suffering adverse consequences from participating in experimental research, and will advise the administrator and the resident and/or family.
8. The frequency and scope of monitoring for adverse consequences will be based on the severity of potential adverse consequences as well as the type and duration of the research. Monitoring parameters and guidelines for physician notification will be established by the research protocol and communicated to the nursing staff.
9. The administrator, director of nursing services, and medical director/attending physician maintain the right to recommend that any research activity be modified or stopped if they have valid clinical reason to believe that participants in a study may be adversely affected.
10. A copy of a signed consent form will be filed in the resident's medical record prior to participation in an experimental research project.
11. Inquiries concerning experimental research activities should be referred to the administrator, the director of nursing services, or to the medical director, as appropriate.

Health, Medical Condition and Treatment Options, Informing Residents of

Policy Statement

Every resident is informed of his or her total health status, medical condition and options for treatment and/or care.

Policy Interpretation and Implementation

1. Each resident is informed of his/her total health status and medical condition, including diagnosis, treatment recommendations and prognosis, in advance of treatment and on an on-going basis. If a resident has an appointed representative, the representative is also informed.
2. The resident's attending physician, the facility's medical director, or the director of nursing services is responsible for informing the resident of his or her medical condition. Such information includes providing the resident/representative with information about the resident's:
 - a. functional status;
 - b. nutritional status;
 - c. rehabilitation and restorative potential;
 - d. activities potential;
 - e. cognitive status;
 - f. oral health status;
 - g. psychosocial status;
 - h. sensory and physical impairments;
 - i. type of care or treatment recommended (based on the assessment and care plan);
 - j. type of care professional who will be providing the care or treatment;
 - k. risks and benefits of proposed care or treatment;
 - l. treatment alternatives or options;
 - m. right to participate in the development and implementation of his or her plan of care;
 - n. right to discontinue or refuse care or treatment;
 - o. right to request changes to the proposed care plan;
 - p. right to review any changes to an existing care plan; and
 - q. right to formulate an advance directive.
3. The person informing the resident/representative of his or her medical condition is required to present such information in a format, language and cultural context that the resident/representative can easily understand. This includes, but is not limited to:
 - a. communicating in plain language;
 - b. explaining technical and medical terminology in a way that makes sense to the resident;
 - c. offering language assistance services to residents who have limited English proficiency; and
 - d. providing qualified sign language interpreters or auxiliary aids if hearing is impaired.
4. Information about the resident's health status is presented at times that are convenient and useful for the resident/representative such as when he or she is asking questions, raising concerns or when a change of treatment is proposed.

Homelike Environment

Policy Statement

Residents are provided with a safe, clean, comfortable and homelike environment and encouraged to use their personal belongings to the extent possible.

Policy Interpretation and Implementation

1. Staff provides person-centered care that emphasizes the residents' comfort, independence and personal needs and preferences.
2. The facility staff and management maximizes, to the extent possible, the characteristics of the facility that reflect a personalized, homelike setting. These characteristics include:
 - a. clean, sanitary and orderly environment;
 - b. comfortable (minimum glare) yet adequate (suitable to the task) lighting;
 - c. inviting colors and décor;
 - d. personalized furniture and room arrangements;
 - e. clean bed and bath linens that are in good condition;
 - f. pleasant, neutral scents;
 - g. plants and flowers, where appropriate;
 - h. comfortable and safe temperatures (71°F - 81°F); and
 - i. comfortable sound levels.
3. The facility staff and management minimizes, to the extent possible, the characteristics of the facility that reflect a depersonalized, institutional setting. These characteristics include:
 - a. overhead paging;
 - b. institutional odors;
 - c. institutional signage (for example, labeled storage closets and work rooms in common areas);
 - d. medication carts; and
 - e. chair and bed alarms.
4. Comfortable and adequate lighting is provided in all areas of the facility to promote a safe, comfortable and homelike environment. The lighting design emphasizes:
 - a. sufficient general lighting in resident-use areas;
 - b. task lighting as needed;
 - c. reduction in glare (through use of light filters, no wax floors);
 - d. even light levels;
 - e. maximum use of daylight;
 - f. night lighting to promote safety and independence; and
 - g. dimming switches, where feasible.
5. Contrasting colors (for example, plates that contrast with the table linens and toilets that contrast with the bathroom wall color) may be used to promote a homelike environment and to aid visually impaired residents.

Noise Control

Policy Statement

This facility strives to maintain comfortable sound levels that enhance privacy when privacy is desired, that encourage interaction when social participation is desired, and that do not interfere with residents' hearing.

Policy Interpretation and Implementation

1. Resident care and services should be provided in a manner that promotes calm, organized and comfortable sound levels.
2. Personnel should refrain from making loud noises or talking in a loud voice when communicating with coworkers and during shift changes. Personnel shall refrain from shouting from one room or section to another.
3. Sound level of radios and televisions shall not disturb other residents, their families, or visitors.
4. Excessive noise from equipment should be reported to the maintenance department (e.g., squeaky medication/food carts, cleaning equipment, laundry hampers, etc.).
5. Paging systems shall not be used unless during emergency conditions.
6. Complaints of noise levels should be referred to the nurse supervisor/charge nurse, director of nursing services, or to the administrator.

Private Duty Sitters

Policy Statement

The use of private duty sitters will be permitted when approved by the resident’s attending physician and the facility’s director of nursing services.

Policy Interpretation and Implementation

1. Residents/family members desiring the use of private duty sitters must first obtain written approval of the attending physician and the director of nursing services.
2. The director of nursing services must consult with the administrator when private duty sitters have been requested.
3. Private duty nursing personnel must follow the facility’s established nursing care policies and procedures, instructions issued by the nurse supervisor/charge nurse, and may not administer direct care to the resident unless authorized in writing by the attending physician.
4. Medications may only be administered by authorized facility personnel.
5. Private duty sitters must report to the nurse supervisor/charge nurse when coming on and going off duty.
6. Private duty sitters must report changes in a resident’s condition to the nurse supervisor/charge nurse immediately.
7. Private duty sitters may not serve for more than twelve (12) hours during a twenty-four (24) hour period.
8. The resident/representative (sponsor) will be responsible for all expenses relative to the use of private duty sitters.
9. Failure of private duty sitters to follow established procedures or instructions from the director of nursing services or other designated individual will be grounds for termination of the service.
10. Our facility’s nursing staff may serve as a private duty sitter when approved by the director of nursing services.

Requesting, Refusing and/or Discontinuing Care or Treatment

Policy Statement

Residents and resident representatives have the right to request, refuse and/or discontinue treatment. “Treatment” refers to medical care, nursing care, and interventions provided to maintain or restore health and well-being, improve functional level, or relieve symptoms.

Policy Interpretation and Implementation

1. Residents/representatives are informed (in advance) of:
 - a. the care that will be furnished or made available to the resident based on his or her assessment and plan of care;
 - b. the risks and benefits of the proposed care, treatment, treatment alternatives or treatment options;
 - c. the type of caregiver or professional that will provide the care; and
 - d. any changes to the resident’s care plan.
2. Residents/representatives are informed of his or her rights to:
 - a. request, refuse and/or discontinue treatment;
 - b. refuse to participate in experimental research; and
 - c. formulate an advance directive.
3. The resident is not forced to accept any care or treatment and may refuse or discontinue care or treatment at any time. This includes care or treatment prescribed by a physician, care or treatment that has been administered previously, and/or care or treatment that the resident previously agreed to but has not yet been administered.
4. The resident/representative has the right to request treatment or care that the resident wishes. However, this facility is not obligated to provide medical treatment or medical services deemed medically unnecessary or inappropriate.
5. If a resident/representative requests, discontinues or refuses care or treatment, an appropriate member of the interdisciplinary team (IDT) will meet with the resident/representative to:
 - a. determine why he or she is requesting, refusing or discontinuing care or treatment;
 - b. try to address his or her concerns and discuss alternative options; and
 - c. discuss the potential outcomes or consequences (positive and negative) of the decision.
6. During the meeting, the IDT member will reiterate the right to request, refuse or discontinue care at any time.
 - a. The resident/representative will not, under any circumstances, be coerced, intimidated, manipulated or threatened for refusing, discontinuing or requesting care or treatment.
 - b. The IDT will assess the resident’s needs and offer the resident/representative alternative treatments, if available and pertinent, while continuing to provide other services outlined in the care plan.
7. If the decision to refuse or discontinue treatment results in a significant change of condition, a reassessment will occur and appropriate changes will be made to the resident’s care plan.

continues on next page

8. Detailed information relating to the request, refusal or discontinuation of treatment are documented in the resident’s medical record.
9. Documentation pertaining to a resident’s request, discontinuation or refusal of treatment includes at least the following:
 - a. The date and time the care or treatment was attempted;
 - b. The type of care or treatment;
 - c. The resident’s response and stated reason(s) for request, discontinuation or refusal;
 - d. The name of the person who attempted to administer the care or treatment;
 - e. That the resident was informed (to the extent of their ability to understand) of the purpose of the treatment and the potential outcome of not receiving the medication/or treatment;
 - f. The resident’s condition and any adverse effects due to the request;
 - g. The date and time the practitioner was notified as well as the practitioner’s response;
 - h. All other pertinent observations; and
 - i. The signature and title of the person recording the data.
10. The healthcare practitioner must be notified of refusal of treatment, in a time frame determined by the resident’s condition and potential serious consequences of the request. For example, a resident’s refusal to take a diuretic while experiencing acute congestive heart failure should be reported immediately, while a refusal to take a blood pressure medication while the blood pressure is well controlled can be reported within 24 hours.
11. The resident is entitled to refuse to participate in experimental research at any time. This includes the right to discontinue any experimental treatment that may have begun with the resident’s consent.

Resident Council

Policy Statement

The facility supports residents' rights to organize and participate in the resident council.

Policy Interpretation and Implementation

1. The purpose of the resident council is to provide a forum for:
 - a. residents, families and resident representatives to have input in the operation of the facility;
 - b. discussion of concerns and suggestions for improvement;
 - c. consensus building and communication between residents and facility staff; and
 - d. disseminating information and gathering feedback from interested residents.
2. All residents are eligible to participate in the resident council. The facility staff encourages residents who are willing to participate. Staff, visitors, or other guests may attend resident council meetings if invited by the respective resident group.
3. The resident council group is provided with space, privacy and support to conduct meetings.
4. The council is encouraged to elect a president or chair to act as a liaison and facilitate communication between the council and a designated staff person who has been approved by the council.
5. Council meetings are scheduled monthly or more frequently if requested by residents. The date, time and location of the meetings are noted in the activities calendar.
6. A *Resident Council Response Form* will be utilized to track issues and their resolution. The facility department related to any issues will be responsible for addressing the item(s) of concern.
7. The quality assurance and performance improvement (QAPI) committee will review information and feedback from the resident council as part of their quality review. Issues documented on council response forms may be referred to the QAPI committee, if applicable (i.e., the issue is of serious nature or if there is a pattern, etc.).

Resident Representative

Policy Statement

The facility treats the decisions of the resident representative as the decisions of the resident to the extent delegated by the resident or to the extent required by the court, in accordance with applicable law.

Policy Interpretation and Implementation

1. A resident who has not been found to be incompetent by the state court has the right to appoint a resident representative who may exercise the resident's rights to the extent provided by state and federal law.
2. If the resident is determined to be incompetent under the laws of the state by a court of competent jurisdiction, the rights of the resident will devolve to and will be exercised by the resident representative appointed to act on the resident's behalf.
 - a. The court-appointed resident representative will exercise the resident's rights to the extent judged necessary by a court of competent jurisdiction, in accordance with state law.
 - b. In the case of a resident representative whose decision-making authority is limited by state law or court appointment, the resident retains the right to make those decisions outside the representative's authority.
 - c. The resident's wishes and preferences are considered in the exercise of rights by the representative.
 - d. To the extent practicable, the resident is provided with opportunities to participate in the care planning process.
3. The term "resident representative" is defined as:
 - a. an individual chosen by the resident to act on behalf of the resident in order to support the resident in decision-making; access medical, social or other personal information of the resident; manage financial matters; or receive notifications;
 - b. a person authorized by state or federal law (including but not limited to agents under power of attorney, representative payees, and other fiduciaries) to act on behalf of the resident in order to support the resident in decision-making; access medical, social or other personal information of the resident; manage financial matters; or receive notifications;
 - c. legal representative, as used in section 712 of the Older Americans Act; or
 - d. the court-appointed guardian or conservator of a resident.
4. The same-sex spouse of a resident is afforded treatment equal to that of an opposite-sex spouse.
5. The resident representative has the right to exercise the resident's rights to the extent those rights are delegated to the representative.
 - a. The facility will treat the decisions of a resident representative as the decisions of the resident to the extent required by the court or authorized by the resident (in accordance with applicable laws).
 - b. If the facility has reason to believe that a resident representative is making decisions or taking actions that are not in the best interests of a resident, the facility will report such concerns when and in the manner required under state law.
 - c. The facility will not extend the resident representative the right to make decisions on behalf of the resident beyond the extent required by the court or delegated by the resident (in accordance with applicable laws).

continues on next page

6. Documentation designating that the representative has been delegated the necessary authority to exercise the resident's rights for decision-making issues is obtained by the director of nursing or a designee.
 - a. To the degree permitted by state law, the facility staff respects the delegated resident representative's decisions regarding the resident's wishes and preferences so long as the resident representative is acting within the scope of authority contemplated by the agreement authorizing the person to act as the resident's representative.
 - b. Whether or not the resident has been judged incompetent by a court of law, if it is determined that the resident understands the risks, benefits, and alternatives to a proposed health care decision and expresses a preference, the resident's wishes are considered to the degree practicable.
7. The resident may exercise his or her rights not delegated to a resident representative, including the right to revoke a delegation of rights (except as limited by state law).
8. The director of nursing (or designee) is responsible for making reasonable efforts to obtain updates or changes that are made by the resident, including the resident's revocation of delegated rights, to ensure that the resident's preferences are being upheld.

Resident Rights

Policy Statement

Employees shall treat all residents with kindness, respect, and dignity.

Policy Interpretation and Implementation

1. Federal and state laws guarantee certain basic rights to all residents of this facility. These rights include the resident's right to:
 - a. a dignified existence;
 - b. be treated with respect, kindness, and dignity;
 - c. be free from abuse, neglect, misappropriation of property, and exploitation;
 - d. be free from corporal punishment or involuntary seclusion, and physical or chemical restraints not required to treat the resident's symptoms;
 - e. self-determination;
 - f. communication with and access to people and services, both inside and outside the facility;
 - g. exercise his or her rights as a resident of the facility and as a resident or citizen of the United States;
 - h. be supported by the facility in exercising his or her rights;
 - i. exercise his or her rights without interference, coercion, discrimination or reprisal from the facility;
 - j. be informed about his or her rights and responsibilities;
 - k. appoint a legal representative of his or her choice, in accordance with state law;
 - l. revoke the delegation of a legal representative, in accordance with state law;
 - m. exercise rights not delegated to a legal representative;
 - n. have his or her same-sex spouse (if applicable) afforded treatment equal to that of an opposite-sex spouse¹;
 - o. be notified of his or her medical condition and of any changes in his or her condition;
 - p. be informed of, and participate in, his or her care planning and treatment;
 - q. access personal and medical records pertaining to him or herself;
 - r. manage his or her personal funds, or have the facility manage his or her funds (if he or she wishes);
 - s. choose an attending physician and participate in decision-making regarding his or her care;
 - t. privacy and confidentiality;
 - u. voice grievances to the facility, or other agency that hears grievances, without discrimination or reprisal and without fear of discrimination or reprisal;
 - v. have the facility respond to his or her grievances;
 - w. examine survey results;
 - x. communicate with outside agencies (e.g., local, state, or federal officials, state and federal surveyors, state long-term care ombudsman, protection or advocacy organizations, etc.) regarding any matter;
 - y. work or not work;
 - z. perform services for the facility if he or she chooses, or refuse to perform services for the facility;
 - aa. visit and be visited by others from outside the facility;

continues on next page

¹ Marriages that are considered valid in the jurisdiction in which they were celebrated are to be recognized as legal and valid, regardless of the laws that apply where the facility is located.

- ab. be informed of safety or clinical restriction or limitations of visitation;
 - ac. access to a telephone, mail and email;
 - ad. communicate in person and by mail, email and telephone with privacy;
 - ae. retain and use personal possessions to the maximum extent that space and safety permit;
 - af. share a room with a spouse, if that is mutually agreeable;
 - ag. share a room with his or her roommate of choice when practicable, both residents live in the same facility and both residents agree;
 - ah. self-administer medication, if the interdisciplinary care planning team determines it is safe;
 - ai. refuse a transfer from a distinct part within the institution; and
 - aj. equal access to quality care, regardless of source of payment.
2. Copies of our resident rights are posted throughout the facility, and a copy is provided to each employee, provider and contracted staff member. In addition, staff will have appropriate in-service training on resident rights prior to having direct-care responsibilities for residents.
 3. The unauthorized release, access, or disclosure of resident information is prohibited. All release, access, or disclosure of resident information must be in accordance with current laws governing privacy of information issues. All inquiries concerning the release of resident information should be directed to the HIPAA compliance officer.
 4. Orientation and in-service training programs are conducted quarterly to assist our employees in understanding our residents' rights.
 5. Inquiries concerning residents' rights should be referred to the social services director.

Resident Self Determination and Participation

Policy Statement

Our facility respects and promotes the right of each resident to exercise his or her autonomy regarding what the resident considers to be important facets of his or her life.

Policy Interpretation and Implementation

1. Each resident is allowed to choose activities, and schedule health care and healthcare providers, that are consistent with his or her interests, values, assessments and plans of care, including:
 - a. daily routine, such as sleeping and waking, eating, exercise and bathing schedules;
 - b. personal care needs, such as bathing methods, grooming styles and dress;
 - c. health care scheduling, such as times of day for therapies and certain treatments;
 - d. providers of healthcare services;
 - e. activities, hobbies and interests; and
 - f. religious affiliation and worship preferences.
2. In order to facilitate resident choices, the administration and staff:
 - a. inform the residents and family members of the residents' right to self-determination and participation in preferred activities;
 - b. gather information about the residents' personal preferences on initial assessment and periodically thereafter, and document these preferences in the medical record;
 - c. include information gathered about the resident's preferences in the care planning process; and
 - d. document and communicate any medical conditions or limitations that may inhibit or interfere with participation in preferred activities.
3. Residents are encouraged to make choices about aspects of their lives in the facility, including:
 - a. rooming with the person of his or her choice, providing both individuals consent to the choice;
 - b. organizing and participating in resident groups;
 - c. interacting with other residents, family and members of the community; and
 - d. participating in community activities inside and outside the facility.
4. Residents are provided assistance as needed to engage in their preferred activities on a routine basis. For example:
 - a. if the resident enjoys reading, the facility will provide access to books (in large print if needed);
 - b. if the resident enjoys regular exercise, he or she will be assisted in attending exercise classes or given access to open areas for walks; and
 - c. if the resident wants to participate in community activities, transportation is arranged.
5. Residents are encouraged to interact with members of the community and participate in community activities inside and outside the facility. Examples of accommodations that support community participation include:
 - a. noting which events or activities the resident expresses an interest in;
 - b. scheduling treatments or therapies so that they do not interfere with activities or events;
 - c. arranging transportation to community events; or
 - d. assisting the resident with planning (tickets, reminders, etc.).

continues on next page

6. The administration and staff supports the organization of and participation in resident and family groups by:
- a. providing a private meeting space for the group;
 - b. helping the group to make family members and other residents aware of the upcoming meeting times in a timely manner;
 - c. respecting that staff, visitors and guests may not attend the resident/family group without invitation;
 - d. supporting the right of resident representatives and families to meet with the representatives and families of other residents within the facility; and
 - e. appointing a staff member (who is approved by the group) to assist the group and respond to written requests resulting from group meetings.

Resident-to-Resident Altercations

Policy Statement

All altercations, including those that may represent resident-to-resident abuse, shall be investigated and reported to the nursing supervisor, the director of nursing services and to the administrator.

Policy Interpretation and Implementation

1. Facility staff will monitor residents for aggressive/inappropriate behavior towards other residents, family members, visitors, or to the staff. Occurrences of such incidents shall be promptly reported to the nurse supervisor, director of nursing services, and to the administrator.
2. If two residents are involved in an altercation, staff will:
 - a. separate the residents, and institute measures to calm the situation;
 - b. identify what happened, including what might have led to aggressive conduct on the part of one or more of the individuals involved in the altercation;
 - c. notify each resident's representative and attending physician of the incident;
 - d. review the events with the nursing supervisor and director of nursing, and possible measures to try to prevent additional incidents;
 - e. consult with the attending physician to identify treatable conditions such as acute psychosis that may have caused or contributed to the problem;
 - f. make any necessary changes in the care plan approaches to any or all of the involved individuals;
 - g. document in the resident's clinical record all interventions and their effectiveness;
 - h. consult psychiatric services as needed for assistance in assessing the resident, identifying causes, and developing a care plan for intervention and management as necessary or as may be recommended by the attending physician or interdisciplinary care planning team;
 - i. complete a *Report of Incident/Accident* form and document the incident, findings, and any corrective measures taken in the resident's medical/clinical record;
 - j. if, after carefully evaluating the situation, it is determined that care cannot be readily given within the facility, transfer the resident; and
 - k. report incidents, findings, and corrective measures to appropriate agencies as outlined in our facility's abuse reporting policy.
3. Inquiries concerning resident-to-resident altercations should be referred to the director of nursing services or to the administrator.

Residents Involved with the Criminal Justice System

Policy Statement

Residents involved in the justice system are entitled to the same rights as all other residents in the facility. The facility does not impose any restrictions on justice-involved residents that violate their resident rights, as described in 42 CFR 483 Subpart B (Requirements of Participation).

Policy Interpretation and Implementation

1. All residents, including justice-involved residents, have the right to a dignified existence, self-determination, communication and access to persons and services inside and outside the facility.
2. “Justice-involved residents” include:
 - a. residents under the care of (taken into custody by) law enforcement;
 - b. residents under community supervision, including those on parole, probation, or ongoing supervision and treatment as an alternative to criminal prosecution; or
 - c. inmates of a public institution, such as prisons, jails, detention facilities, or other penal institutions.
3. The facility does not admit or accept responsibility for justice-involved individuals whose terms of release or placement (as stipulated by the department of corrections or law enforcement) are contrary to CMS requirements of participation.
4. Law enforcement jurisdiction is not integrated with facility operations. This facility maintains control over the conditions under which the resident receives care.
5. Justice involved residents are screened prior to and upon admission according to federal requirements. Only individuals for whom the facility can provide necessary care and services are admitted.
6. An individual with a mental health diagnosis receives screening for mental health services (Pre-Admission Screening and Resident Review) to ensure the most appropriate setting and the availability of services for his or her needs. If it is determined that the facility cannot meet those needs, the individual is not accepted for admission, but referred to the setting(s) that can better serve him or her.
7. If admitting a particular individual compromises the health, safety and rights of other residents, visitors and staff he or she will not be admitted.
8. If a justice-involved individual is admitted, the following measures are taken:
 - a. Reviewing the medical records and other pertinent documentation from correctional providers;
 - b. Conducting a comprehensive assessment and resident-centered care plan by the interdisciplinary team;
 - c. Providing staff training specific to care of a resident under the jurisdiction of law enforcement or a correctional institution; and
 - d. Ensuring that the safety, rights and quality of care are maintained for all residents and staff.
9. Physical restraints, chemical restraints and/or involuntary seclusion are not used for any resident, including justice-involved residents, unless the requirements for the use of restraints or seclusion at 42 CFR 483.12 are met.

Translation and/or Interpretation of Facility Services

Policy Statement

This facility’s language access program will ensure that individuals with limited English proficiency (LEP) shall have meaningful access to information and services provided by the facility.

Policy Interpretation and Implementation

1. In general, the types of language access services provided by this facility shall be determined by the following factors:
 - a. The size (number and proportion) of the eligible LEP population served by the facility;
 - b. The frequency with which the particular LEP population is in contact with the facility;
 - c. The nature and/or importance of the information or service that needs to be conveyed; and
 - d. The resources (funds and personnel) available to ensure the provision of language access services to LEP individuals.
2. When encountering LEP individuals, staff members will conduct the initial language assessment (e.g., “I Speak Cards”) and notify the staff person in charge of the language access program.
3. The coordinator of this facility’s language access program is the director of social services, or his/her designee.
4. All LEP persons shall receive a written notice in their primary language of their rights to obtain competent oral translation services free of charge. If written notice is not possible, such notice shall be given orally.
5. Written notification of language access rights may be provided by signs posted in the lobbies; and/or pamphlets provided during admission.
6. This facility shall provide written translation of vital information pertaining to health services, resident rights and facility policy if the limited English proficiency (LEP) population represents at least five (5) percent of the population or 1000 people eligible to be served by the facility (whichever is fewer).
7. Written translation of vital information is available in the following languages at this time:
 - a. _____
 - b. _____
 - c. _____
8. “Vital information” includes the following:
 - a. Eligibility for services or benefits (including language access);
 - b. Admission information (including financial responsibility);
 - c. Advance directives;
 - d. Resident rights;
 - e. Authorization for use or disclosure of protected health information;
 - f. Consent for treatment;
 - g. Denial, loss, or decreases in Medicaid or Medicare benefits;
 - h. Social services information; and
 - i. Notice of pending discharge and discharge instructions.

continues on next page

9. “Non-vital” information includes:
 - a. dietary (e.g., menus) and activity services information;
 - b. public service information;
 - c. admission handbooks; and
 - d. general information about the facility programs and services.
10. When written translation of vital information is unavailable, or impractical (i.e., an infrequently encountered language), the facility shall attempt to provide oral translation of vital documents.
11. Competent oral translation of vital information that is not available in written translation, and non-vital information shall be provided in a timely manner and at no cost to the resident through the following means (as available to the facility):
 - a. A staff member who is trained and competent in the skill of interpreting;
 - b. A staff interpreter who is trained and competent in the skill of interpreting;
 - c. Contracted interpreter service;
 - d. Voluntary community interpreters who are trained and competent in the skill of interpreting; and
 - e. Telephone interpretation service.
12. Interpreters and translators must be appropriately trained in medical terminology, confidentiality of protected health information, and ethical issues that may arise in communicating health-related information.
13. Family members and friends shall not be relied upon to provide interpretation services for the resident, unless explicitly requested by the resident. If family or friends are used to interpret, the resident must provide written consent for disclosure of protected health information.
14. It is understood that providing meaningful access to services provided by this facility requires also that the LEP resident’s needs and questions are accurately communicated to the staff. Oral interpretation services therefore include interpretation from the LEP resident’s primary language back to English.
15. It is understood that in order to provide meaningful access to services provided by this facility, translation and/or interpretation must be provided in a way that is culturally relevant and appropriate to the LEP individual.
16. The quality assurance and performance improvement committee shall assess bi-annually the LEP population in the surrounding community. The QAPI committee shall determine whether the current language access program serves the needs of eligible populations and make adjustments as necessary.
17. Staff shall be trained upon hire and at least annually on how to provide language access services to LEP residents.

Videotaping, Photographing, and Other Imaging of Residents

Policy Statement

Residents will be protected from invasion of privacy and/or abuse that might occur from photographs, videotapes, digital images, and recordings during resident care or other facility activities.

Policy Interpretation and Implementation

1. For the purpose of this policy, “resident image” means the likeness of a resident captured through still photography, videotaping, digital imaging, scans, audio recording, etc.
2. Staff may not take or release images or recordings of any resident without explicit written consent. Written consent must be obtained from the resident or representative *prior* to obtaining images or recordings of the resident for any purposes other than investigation of abuse, neglect or emergencies, and photography obtained for personal/family use at the verbal request of the resident or family.
3. Transmitting unauthorized images of any resident through email, internet or social media is considered a violation of resident rights. Any image or recording taken that may be construed as humiliating or demeaning to a resident or residents is considered resident abuse and will be reported and investigated as such.
4. Resident photographs are considered health care records and will be retained and released in accordance with current applicable regulations and statutes governing the release of protected health information.
5. Should resident photographs be used for the purposes of teaching, education, or research, all reasonable efforts will be taken to protect the anonymity of the resident.
6. Resident photographs taken in the facility will not include identifiable images of other residents from whom similar approval to photograph has not been obtained.
7. All resident photographs and consents will be retained in accordance with facility policy governing the safekeeping and retention of resident medical records.

Visitation

Policy Statement

Our facility permits residents to receive visitors subject to the resident's wishes and the protection of the rights of other residents in the facility.

Policy Interpretation and Implementation

1. Residents are permitted to have visitors of their choosing at the time of their choosing.
2. The facility provides 24-hour access to individuals visiting with the consent of the resident. Some visitation may be subject to reasonable restrictions that protect the safety, security and/or rights of the facility's residents such as:
 - a. denying or providing limited supervised visits from persons who are known or suspected to be abusing, exploiting or coercive to the resident; until an investigation into the allegation has been completed;
 - b. denying access to individuals who are found to have committed criminal acts;
 - c. denying access to visitors who are inebriated or disruptive; and/or
 - d. protecting residents from a community-associated infection or communicable disease outbreak in the community.
3. Visitors may include, but are not limited to:
 - a. spouses (including same-sex and transgender spouses);
 - b. domestic partners (including same-sex and transgender domestic partners);
 - c. other family members; and
 - d. friends.
4. Family members are designated as such by the resident or representative. Immediate family is not restricted to individuals related by blood, adoption, marriage or common law.
5. All lawful marriages and spouses are recognized for purposes of this and all other policies, regardless of any contradictory state or local laws.
6. The facility does not restrict visitors based on the request of family members or the healthcare power of attorney. If a family member (or HPOA) requests that a certain individual be denied access to resident based on safety or security concerns, the staff will protect resident safety while allowing visitor access until the allegations are investigated.
7. Residents, family and/or resident representatives are informed upon admission of their visitation rights, and related policies.
8. Residents are permitted to visit with representatives from federal and state survey agencies, resident advocates, the state long-term care ombudsman, protection and advocacy agencies for individuals with developmental disabilities or mental illness, clergy and/or their personal physicians at any time. Space and privacy are provided for such visits.
9. Visitors are never denied, restricted or limited on the basis of race, color, national origin, religion, sex, gender identity, sexual orientation or disability. All visitors are given full and equal visitation privileges consistent with resident preferences.

continues on next page

10. The resident has the right to deny visitation at any time. If a resident chooses to withdraw consent for visitation by a particular individual, the name of that person and the date of withdrawn consent are documented in the resident’s medical record.
11. The facility reserves the right to limit the number of visitors in the room at one time to protect the rights of the person sharing the room.
12. A critically ill resident may have visitors of his/her choice at any time, as long as visitation is not medically contraindicated. The rationale for medically-restricted visitation is documented in the resident’s medical record.
13. The facility does not restrict, limit, or otherwise deny visitation privileges on the basis of race, color, national origin, religion, sex, gender identity, sexual orientation or disability.
14. The facility reserves the right to change the location of a visit if such visit infringes upon the rights of the resident’s roommate or other residents in the facility.
15. Unless otherwise permitted by the resident, visitors are required to wait outside the room or in the lobby while the resident is receiving treatment, undergoing examinations, and/or receiving personal care.
16. Incidents of any visitor’s disruptive behavior are documented in the resident’s medical record or other facility approved form.
17. Space is available in the lobby/lounge for residents to receive guests in reasonable comfort and privacy.
18. Inquiries concerning visitation and access to the facility should be referred to the administrator or his/her designee.

Voting Rights

Policy Statement

Residents are encouraged to exercise their right to vote in local, state and national elections.

Policy Interpretation and Implementation

1. The facility assists residents expressing a desire to vote.
2. The resident exercises his or her right to vote without interference, coercion, discrimination or reprisal from the facility or facility staff.
3. A resident's voting decisions are considered private and not discussed with other residents or staff.
4. The social services department helps residents to vote by:
 - a. assisting with voter registration;
 - b. obtaining and distributing absentee ballots;
 - c. providing writing tools, stamps and assistance with sending mail-in ballots; and/or
 - d. providing transportation to voting sites or ballot drop boxes.
5. If a state has a specific program that enables residents to vote, the social services department engages with these programs to facilitate resident voting.
6. Residents or staff who believe that a resident's right to vote has been impeded are encouraged to file a complaint with the state survey agency, which can be located at the link below.
7. All requests for voting information should be directed to the social services department.

Accidents and Incidents – Investigating and Reporting

Policy Statement

All accidents or incidents involving residents, employees, visitors, vendors, etc., occurring on our premises shall be investigated and reported to the administrator.

Policy Interpretation and Implementation

1. The nurse supervisor/charge nurse and/or the department director or supervisor shall promptly initiate and document investigation of the accident or incident.
2. The following data, as applicable, shall be included on the *Report of Incident/Accident* form:
 - a. The date and time the accident or incident took place;
 - b. The nature of the injury/illness (e.g., bruise, fall, nausea, etc.);
 - c. The circumstances surrounding the accident or incident;
 - d. Where the accident or incident took place;
 - e. The name(s) of witnesses and their accounts of the accident or incident;
 - f. The injured person's account of the accident or incident;
 - g. The time the injured person's attending physician was notified, as well as the time the physician responded and his or her instructions;
 - h. The date/time the injured person's family was notified and by whom;
 - i. The condition of the injured person, including his/her vital signs;
 - j. The disposition of the injured (i.e., transferred to hospital, put to bed, sent home, returned to work, etc.);
 - k. Any corrective action taken;
 - l. Follow-up information;
 - m. Other pertinent data as necessary or required; and
 - n. The signature and title of the person completing the report.
3. This facility is in compliance with current rules and regulations governing accidents and/or incidents involving a medical device.
4. This facility will adhere to the definitions in the Medical Device Reporting Act when filing the Food and Drug Administration MED-WATCH Forms (3500).
5. The nurse supervisor/charge nurse and/or the department director or supervisor shall complete a *Report of Incident/Accident* form and submit the original to the director of nursing services within 24 hours of the incident or accident.
6. The director of nursing services shall ensure that the administrator receives a copy of the *Report of Incident/Accident* form for each occurrence.
7. Incident/accident reports will be reviewed by the safety committee for trends related to accident or safety hazards in the facility and to analyze any individual resident vulnerabilities.

Bed Safety

Policy Statement

Our facility shall strive to provide a safe sleeping environment for the resident.

Policy Interpretation and Implementation

1. The resident's sleeping environment shall be assessed by the interdisciplinary team, considering the resident's safety, medical conditions, comfort, and freedom of movement, as well as input from the resident and family regarding previous sleeping habits and bed environment.
2. To try to prevent deaths/injuries from the beds and related equipment (including the frame, mattress, side rails, headboard, footboard, and bed accessories), the facility shall promote the following approaches:
 - a. Inspection by maintenance staff of all beds and related equipment as part of our regular bed safety program to identify risks and problems including potential entrapment risks;
 - b. Review that gaps within the bed system are within the dimensions established by the FDA (Note: The review shall consider situations that could be caused by the resident's weight, movement or bed position.);
 - c. Ensure that when bed system components are worn and need to be replaced, components meet manufacturer specifications;
 - d. Ensure that bed side rails are properly installed using the manufacturer's instructions and other pertinent safety guidance to ensure proper fit (e.g., avoid bowing, ensure proper distance from the headboard and footboard, etc.); and
 - e. Identify additional safety measures for residents who have been identified as having a higher than usual risk for injury including entrapment (e.g., altered mental status, restlessness, etc.).
3. The maintenance department shall provide a copy of inspections to the administrator and report results to the QA committee for appropriate action. Copies of the inspection results and QA committee recommendations shall be maintained by the administrator and/or safety committee.
4. The facility's education and training activities will include instruction about risk factors for resident injury due to beds, and strategies for reducing risk factors for injury, including entrapment.
5. If side rails are used, there shall be an interdisciplinary assessment of the resident, consultation with the attending physician, and input from the resident and/or legal representative.
6. The staff shall obtain consent for the use of side rails from the resident or the resident's legal representative prior to their use.
7. After appropriate review and consent as specified above, side rails may be used at the resident's request to increase the resident's sense of security (e.g., if he/she has a fear of falling, his/her movement is compromised, or he/she is used to sleeping in a larger bed).
8. Side rails may be used if assessment and consultation with the attending physician has determined that they are needed to help manage a medical symptom or condition, or to help the resident reposition or move in bed and transfer, and no other reasonable alternatives can be identified.

continues on next page

9. Before using side rails for any reason, the staff shall inform the resident and family about the benefits and potential hazards associated with side rails.
10. When using side rails for any reason, the staff shall take measures to reduce related risks.
11. Side rails shall not be used as protective restraints. Should a protective restraint be used, our facility's protocol for the use of restraints shall be followed.
12. The use of physical restraints on individuals in bed shall be limited to situations where they are needed to treat a resident's medical symptoms, and only after being reviewed by authorized individuals.
13. The staff shall report to the director of nursing and administrator any deaths, serious illnesses and/or injuries resulting from a problem associated with a bed and related equipment including the bed frame, bed side rails, and mattresses. The administrator shall ensure that reports are made to the Food and Drug Administration or other appropriate agencies, in accordance with pertinent laws and regulations including the Safe Medical Devices Act.

Closed-Circuit TVs

Policy Statement

Our facility uses closed-circuit TVs in common areas of the facility (hallways, dining rooms, employee work areas, outside areas, etc.) to monitor the safety and well-being of our staff and residents. The facility will use video cameras in accordance with applicable laws and regulations.

Policy Interpretation and Implementation

1. All employees are informed about our facility's use of closed-circuit TVs to monitor the safety and well-being of our staff and residents. Employees must sign consent forms allowing the facility to tape them during duty hours.
2. Prior to or upon admission, residents are informed of the facility's use of closed-circuit TVs throughout common areas of the building. Consent forms are obtained allowing the facility to view residents while in these areas of the building.
3. Unless approved by the administrator, and with the consent of the resident, surveillance equipment may not be installed in any resident room or treatment area.
4. Facility management and the QAPI committee may review videos for content and to identify ways to improve care and services. Videotapes will be kept for 30 days and then destroyed unless the video content is needed for investigative, legal or other purposes approved by the administrator. The administrator will ensure that any tapes are stored in an appropriately secure location with limited access.
5. Only the administrator may authorize archiving or copying of videotapes. If a video is kept beyond 30 days or a copy is made, there will be documentation as to why the video was archived or a copy was made, where it will be stored, to whom the copy was provided, and the date provided.
6. Inquiries concerning the use of closed-circuit TVs, obtaining copies of videotapes, security concerns, consents, etc., should be referred to the administrator.

Electrical Safety for Residents

Policy Statement

The resident will be protected from injury associated with the use of electrical devices, including electrocution, burns and fire.

Policy Interpretation and Implementation

1. Orient the resident to basic electrical safety precautions as part of the admission process, and reinforce the following guidelines with the resident as indicated and/or appropriate:
 - a. Ensure that hands are dry before using an electrical device;
 - b. Do not use electrical devices while standing on a wet floor;
 - c. Pull electrical cords out by the plug and never yank the cord;
 - d. Report electrical devices if they cause even minor shocks;
 - e. Unplug any electrical device that appears to be overheating by smell or touch;
 - f. Do not use any electrical device that has been dropped or abused, or if liquid has spilled into it. Wait until it has been checked and declared safe for use; and
 - g. Do not use electrical appliances where oxygen is being administered or stored.
2. Inspect electrical outlets, extension cords, power strips, and electrical devices as part of routine fire safety and maintenance inspections.
3. Portable space heaters are not permitted in the facility.
4. Halogen lamps shall be used with caution and away from combustible items in the resident's environment.
5. Extension cords shall not be used as a substitute for adequate wiring in the facility.
6. When extension cords are used, the following precautions must be taken:
 - a. Secure extension cords and do not place overhead, under carpets, or where they can cause trips, falls, or overheat;
 - b. Connect extension cords to only one device;
 - c. Ensure that the type of cord used is appropriate of the size and type of electrical load;
 - d. Ensure that cords have proper grounding; and
 - e. Inspect regularly for fraying, cuts, or breakage.
7. Power strips shall not be used as a substitute for adequate electrical outlets in the facility. Power strips may be used for a computer, monitor, and printer.
8. Power strips shall not be used with medical devices in resident-care areas.
9. When power strips are used, the following precautions must be taken:
 - a. Install internal ground fault and over-current protection devices;
 - b. Secure power strips so that they do not cause trips or falls; and
 - c. Use power strips that are adequate for the number and types of devices used.
10. Ground fault circuit interruption devices shall be used in locations near water sources to prevent electrocution of residents and staff.
11. The use of electric blankets and electric heating pads is discouraged.

continues on next page

12. When electric blankets are used, the following precautions must be taken to prevent thermal injury and fires:
- Follow manufacturer's instructions for use;
 - Do not allow residents to sleep with electric blankets or heating pads turned on;
 - Do not "tuck" electric blankets into the residents' bedding;
 - Do not allow the blanket or pad to be squeezed or become constricted;
 - Encourage residents to report redness, pain, or burning sensation on or near the areas exposed to heat; and
 - Inspect residents' skin often for signs of thermal injury. Severe burns can result from prolonged exposure to one area of the body, even at low temperatures.

Hazardous Areas, Devices and Equipment

Policy Statement

All hazardous areas, devices and equipment in the facility will be identified and addressed appropriately to ensure resident safety and mitigate accident hazards to the extent possible.

Policy Interpretation and Implementation

1. As part of the facility's overall safety and accident prevention program, hazardous areas and objects in the resident environment will be identified and addressed by the safety committee.
2. The safety committee will consist of members from the interdisciplinary team, which will include a representative from the clinical, leadership, maintenance, and environmental services teams.

Identification of Hazards

1. A hazard is defined as anything in the environment that has the potential to cause injury or illness. Examples of environmental hazards include, but are not limited to the following:
 - a. Equipment and devices that are left unattended or are malfunctioning;
 - b. Devices and equipment that are improperly used or poorly maintained;
 - c. Sharp objects that are accessible to vulnerable residents;
 - d. Open areas or items that should be locked when not in use;
 - e. Irregular floor surfaces (cords, buckled carpeting, etc.);
 - f. Objects in the hallways that obstruct a clear path;
 - g. Access to toxic chemicals;
 - h. Insufficient lighting or glare;
 - i. Unsafe exposure to heating elements or water temperatures;
 - j. Furniture that is unstable or positioned at an improper height for residents; or
 - k. Disabled locks, latches or alarms.

Assessment and Analysis of Hazards

1. Assessment and analysis of hazardous areas and equipment will include resident-specific information including identification of vulnerable residents.
2. Any element of the resident environment that has the potential to cause injury and that is accessible to a vulnerable resident is considered hazardous.
3. Resident vulnerability is based on risk factors including the individual resident's functional status, medical condition, cognitive abilities, mood, and health treatments (e.g., medications).
4. Resident vulnerability to hazards may change over time. Ongoing assessment helps identify when elements in the environment pose hazards to a particular resident.
5. Improper or inappropriate use of equipment and devices will be identified as part of the hazards assessment and analysis.

continues on next page

6. Data from accident and incident reports will be used as part of the hazards assessment and analysis, including trends in accident types, areas in the facility, associations with particular staff or shifts, and equipment use.

Interventions

1. Once identified, the safety committee will document recommendations for areas and equipment that can be changed or adapted to lessen the potential for accidents, such as hazardous areas that are not adequately secured or supervised, equipment that is defective, and/or devices that are used improperly due to lack of training.
2. Interventions will address the specific hazards identified, and may be facility-specific or resident-specific.
3. Facility-specific interventions may include staff training or repairing equipment.
4. Resident-specific interventions may include changes to the plan of care and/or increased supervision.
5. Hazardous areas in the facility that cannot be eliminated, adapted or corrected will be marked clearly and identified on floor plans posted throughout the facility.
6. The safety committee will recommend measures to ensure that vulnerable residents cannot access hazardous areas in the facility (locks, alarms, supervision, etc.).
7. The safety committee will periodically check for the implementation and integrity of measures intended to prevent residents from accessing hazardous areas.
8. Interim safety measures for temporary hazards, such as painting or construction work, may be necessary. These may include posting warning signs, redirecting foot traffic, increasing supervision and if necessary, limiting access to anyone but authorized personnel.
9. Interventions will be documented in the committee meeting minutes, memos to leadership staff, training materials, or as part of the QAPI program.
10. Interventions will be accompanied by communication with staff and leadership, residents, family and visitors.
11. The administrator is responsible for communicating all safety recommendations adopted by the safety committee to the appropriate departments within the facility.
12. Training on safety and interventions to reduce hazard risks will be ongoing.
13. As part of an overall culture of safety, staff, residents and family will be encouraged to report anything that appears to be an environmental hazard or a safety concern.

Monitoring

1. Monitoring to ensure that recommendations are implemented consistently and correctly will be a component of the safety and accident prevention program.
2. The safety committee will assess the effectiveness of interventions and make changes as necessary based on monitoring data.

Poison Control

Policy Statement

Poison control information shall be readily available throughout the facility.

Policy Interpretation and Implementation

1. Information about poisoning and poison control, including key contact information, is located at _____ . This information shall be posted at each nurses' station and other areas of the facility where hazardous and poisonous substances may be used or stored.
2. Antidote information is also available at each nurses' station.
3. If a resident is suspected of taking poison, nursing staff will notify the attending physician and director of nursing services immediately.
4. Administer treatment as ordered by the physician, based on poison control recommendations.
5. Nursing staff will document the resident's condition, in detail, in the resident's clinical record, and the interventions that were made.
6. Staff will complete an incident report per the appropriate policy.

Recall of Equipment/Drugs

Policy Statement

The administrator, consultant pharmacist, director of nursing, and safety committee shall collaborate when equipment, medical supplies, or drugs have been recalled.

Policy Interpretation and Implementation

1. Upon receiving notice of a recall of equipment or medical supplies, the director of nursing services, or designee, shall oversee the removal of such supplies from immediate use.
2. The safety committee and administrator shall help the director of nursing ensure that such equipment, supplies, or medications have been removed from use and are destroyed, returned, or otherwise managed as requested or required by the vendor, manufacturer, government agencies, etc.

Reporting Suspicion of a Crime

Policy Statement

The administrator, director of nursing services, or any other designated individual will report (within the required time frames) any reasonable suspicion of a crime against a resident to the state survey agency and local law enforcement agency.

Employees will be protected against retaliation for reporting any reasonable suspicion of a crime against a resident.

Policy Interpretation and Implementation

1. Once a year, the governing board will determine whether or not the facility received at least \$10,000 in federal funds during the preceding fiscal year. If it received at least \$10,000 in federal funds in the preceding year, all facility reporting obligations in this policy apply.
2. Once a year, each “covered individual” shall be notified in writing of his or her obligations to report any reasonable suspicion of a crime to the state survey agency and at least one local law enforcement agency.
 - a. A “covered individual” is defined as anyone who is an owner, operator, employee, manager, agent, or contractor of the facility.
3. Each covered individual must report to the state survey agency and at least one local law enforcement agency any reasonable suspicion of a crime against a resident of the facility.
 - a. A “crime” is defined by the laws of the political subdivision where the facility is located.
 - b. The administrator and governing board shall coordinate with local law enforcement agencies to determine what actions are considered crimes within the political subdivision.
 - c. Law enforcement may include police, sheriffs, detectives, public safety officers, corrections personnel, prosecutors, medical examiners, investigators, or coroners.
 - d. Examples of crimes that would be reportable in any jurisdiction include but are not limited to:
 - (1) murder;
 - (2) manslaughter;
 - (3) rape;
 - (4) assault/battery;
 - (5) sexual abuse;
 - (6) theft/robbery;
 - (7) drug diversion for personal gain or use;
 - (8) identity theft; and
 - (9) fraud and forgery.
4. The timing of reporting will be based on the events that cause suspicion and will be as follows:
 - a. If the event results in serious bodily injury, the suspicion will be reported immediately but not more than two hours after the individual first suspects that a crime has occurred.
 - b. If the event does not result in serious bodily injury, the suspicion will be reported not more than twenty-four hours after the individual first suspects that a crime has occurred.
 - c. “Serious bodily injury” is defined as an injury involving:
 - (1) serious physical pain;
 - (2) substantial risk of death;

continues on next page

- (3) protracted loss or impairment of a bodily member, organ or mental faculty;
 - (4) sexual abuse or aggravated sexual abuse; and/or
 - (5) medical intervention requirement such as hospitalization, surgery or physical rehabilitation.
5. If multiple individuals intend to report the same incident, these individuals may file a single report to the state survey agency as long as the report contains information about the suspected crime from each covered individual's perspective and the report includes each covered individual's name.
 6. Additional information or suspicions that are formed after the report is made may be included as a supplement to the report. The supplement will include the names of individuals reporting a suspicion, as well as the date and time that they became aware of the incident.
 7. No report that has already been submitted (single or multiple-person) will preclude an individual from reporting his or her own suspicion independently, in his or her own words.
 8. Employees (covered individuals or not) are encouraged to report any reasonable suspicion of a crime and will be protected against any retaliation for their reporting.
 9. Any of the following could be considered retaliation against an employee and will not be condoned:
 - a. Discharging;
 - b. Demoting;
 - c. Suspending;
 - d. Threatening;
 - e. Harassing; or
 - f. Denying promotion or other employment-related benefit.
 10. If the employee/covered individual suspects retaliation by the facility for reporting his or her reasonable suspicion of a crime, the employee may file a complaint with the state survey agency.
 11. Employees will be notified, by the conspicuous posting of a sign or signs, of their right to file a complaint against the facility to the state survey agency if the facility retaliated against the employee after the employee reported a reasonable suspicion of a crime.
 12. All staff will receive training on the following points related to this policy:
 - a. Who is considered a "covered individual";
 - b. Examples of "crimes" as defined by the political subdivision in which the facility is located;
 - c. The obligation to report a reasonable suspicion of a crime;
 - d. Time frames required for reporting;
 - e. Definitions of and how to recognize "serious bodily injury";
 - f. Possible (but not required) formats for reporting;
 - g. Employee rights to be free of retaliation for reporting; and
 - h. Employee rights to file a complaint against the facility for retaliation.
 13. Notification of covered individuals and completed training on reporting reasonable suspicion of a crime will be documented and maintained by the human resources department.

Resident Identification System

Policy Statement

A resident identification system is used to help facility personnel provide medical and nursing care.

Policy Interpretation and Implementation

1. Our facility has adopted a photo and/or wristband identification system to help assure that medication and treatments are administered to the right resident.
2. Data contained on the photo identification card is confidential and is used by nursing service personnel when administering medications and treatments.
3. Information contained on resident identification cards may only be released to authorized personnel in accordance with facility policy and current state/federal regulations governing the release of resident information.
4. Prior to or upon admission, the resident or his/her representative (sponsor) must authorize the facility in writing to photograph the resident and to release data contained in the identification file.
5. Nursing staff will review and update resident identification information as necessary, in conjunction with the business office.
6. Inquiries about our resident identification system should be referred to the director of nursing services.

Routine Resident Checks

Policy Statement

Staff shall make routine resident checks to help maintain resident safety and well-being.

Policy Interpretation and Implementation

1. To ensure the safety and well-being of our residents, nursing staff shall make a routine resident check on each unit at least once per each 8-hour shift.
2. Routine resident checks involve entering the resident's room and/or identifying the resident elsewhere on the unit to determine if the resident's needs are being met, identify any change in the resident's condition, identify whether the resident has any concerns, and see if the resident is sleeping, needs toileting assistance, etc.
3. The person conducting the routine check shall report promptly to the nurse supervisor/charge nurse any changes in the resident's condition and medical needs.
4. The nursing supervisor/charge nurse shall keep documentation related to these routine checks, including the time, identity of the person making checks, and any outcomes of each check. (Note: CNAs may also record this information and provide it to the nurse supervisor/charge nurse.)

Safety and Supervision of Residents

Policy Statement

Our facility strives to make the environment as free from accident hazards as possible. Resident safety and supervision and assistance to prevent accidents are facility-wide priorities.

Policy Interpretation and Implementation

Facility-Oriented Approach to Safety

1. Our facility-oriented approach to safety addresses risks for groups of residents.
2. Safety risks and environmental hazards are identified on an ongoing basis through a combination of employee training, employee monitoring, and reporting processes; QAPI reviews of safety and incident/accident data; and a facility-wide commitment to safety at all levels of the organization.
3. When accident hazards are identified, the QAPI/safety committee shall evaluate and analyze the cause(s) of the hazards and develop strategies to mitigate or remove the hazards to the extent possible.
4. Employees shall be trained on potential accident hazards and demonstrate competency on how to identify and report accident hazards, and try to prevent avoidable accidents.
5. The QAPI committee and staff shall monitor interventions to mitigate accident hazards in the facility and modify as necessary.

Individualized, Resident-Centered Approach to Safety

1. Our individualized, resident-centered approach to safety addresses safety and accident hazards for individual residents.
2. The interdisciplinary care team shall analyze information obtained from assessments and observations to identify any specific accident hazards or risks for individual residents.
3. The care team shall target interventions to reduce individual risks related to hazards in the environment, including adequate supervision and assistive devices.
4. Implementing interventions to reduce accident risks and hazards shall include the following:
 - a. Communicating specific interventions to all relevant staff;
 - b. Assigning responsibility for carrying out interventions;
 - c. Providing training, as necessary;
 - d. Ensuring that interventions are implemented; and
 - e. Documenting interventions.
5. Monitoring the effectiveness of interventions shall include the following:
 - a. Ensuring that interventions are implemented correctly and consistently;
 - b. Evaluating the effectiveness of interventions;
 - c. Modifying or replacing interventions as needed; and
 - d. Evaluating the effectiveness of new or revised interventions.

continues on next page

Systems Approach to Safety

1. The facility-oriented and resident-oriented approaches to safety are used together to implement a systems approach to safety, which considers the hazards identified in the environment and individual resident risk factors, and then adjusts interventions accordingly.
2. Resident supervision is a core component of the systems approach to safety. The type and frequency of resident supervision is determined by the individual resident's assessed needs and identified hazards in the environment.
3. The type and frequency of resident supervision may vary among residents and over time for the same resident. For example, resident supervision may need to be increased when there are temporary hazards in the environment (such as construction) or if there is a change in the resident's condition.

Resident Risks and Environmental Hazards

1. Due to their complexity and scope, certain resident risk factors and environmental hazards are addressed in dedicated policies and procedures. These risk factors and environmental hazards include the following:
 - a. Bed Safety;
 - b. Safe Lifting and Movement of Residents;
 - c. Falls;
 - d. Smoking;
 - e. Unsafe Wandering;
 - f. Poison Control;
 - g. Electrical Safety; and
 - h. Water Temperatures.
2. Other topics related to resident risk and environmental hazards may be addressed within related policies and procedures (for example, adequate lighting is addressed under the topic of falls).

Safety of Hot Liquids

Policy Statement

Residents will be evaluated for safety concerns and potential for injury from hot liquids upon admission, readmission and on change of condition. Appropriate precautions will be implemented to maximize choice of beverages while minimizing the potential for injury.

Policy Interpretation and Implementation

1. The potential for burns from hot liquids is considered an ongoing concern among residents with weakened motor skills, balance issues, impaired cognition, and nerve or musculoskeletal conditions.
2. Residents with these or other conditions may suffer from accidental burns and related complications stemming from thinner, more fragile skin that may burn quickly and severely and take longer to heal.
3. Residents who prefer hot beverages with meals (i.e., coffee, tea, soups, etc.) will not be restricted from these options. Instead, staff will conduct regular hot liquids safety evaluations as indicated, and document the risk factors for scalding and burns in the care plan.
4. Once risk factors for injury from hot liquids are identified, appropriate interventions will be implemented to minimize the risk from burns. Such interventions may include:
 - a. maintaining a hot liquids serving temperature of not more than 180 degrees Fahrenheit;
 - b. serving hot beverages in a cup with a lid;
 - c. encouraging residents to sit at a table while drinking or eating hot liquids;
 - d. providing protective lap covering or clothing to protect skin from accidental spills; and
 - e. staff supervision or assistance with hot beverages.
5. Food service staff will monitor and maintain foods temperatures that comply with food safety requirements but do not exceed recommended temperatures to prevent scalding.

Signing Residents Out

Policy Statement

All residents leaving the premises must be signed out.

Policy Interpretation and Implementation

1. Each resident leaving the premises (excluding transfers/discharges) must be signed out.
2. A sign-out register is located at each nurses' station. Registers must indicate the resident's expected time of return.
3. Unless otherwise prohibited by law, medications that must be administered while the resident is out will be given to the resident/person signing the resident out.
4. Written and/or oral instructions on when and how to administer the medication will be provided to the resident or to the person signing the resident out. Only medications that must be administered while the resident is out will be issued.
5. The nurse supervisor/charge nurse is responsible for notifying the dietary manager when the resident will be away from the facility during meal hours and when the resident has returned. Such notification may be through oral, written or electronic communication.
6. Staff observing a resident leaving the premises, and having doubts about the resident being properly signed out, should notify their supervisor at once.
7. Restrictions noted on the resident's chart concerning who may not sign the resident out must be honored unless otherwise prohibited by facility policy or state/federal law governing such releases.
8. If the resident chooses to go with the individual, the director of nursing services and/or administrator must be contacted and informed of the situation.
9. Residents must be signed in upon return to the facility.
10. Inquiries concerning the signing out of residents should be referred to the director of nursing services or to the administrator.

Smoking Policy – Residents

Policy Statement

This facility shall establish and maintain safe resident smoking practices.

Policy Interpretation and Implementation

1. Prior to, and upon admission, residents shall be informed of the facility smoking policy, including designated smoking areas, and the extent to which the facility can accommodate their smoking or non-smoking preferences.
2. Smoking is only permitted in designated resident smoking areas, which are located outside of the building. Electronic cigarettes may be permitted inside in designated areas only. Otherwise, smoking is not allowed inside the facility under any circumstances.
3. Oxygen use is prohibited in smoking areas.
4. Metal containers, with self-closing cover devices, are available in smoking areas.
5. Ashtrays are emptied only into designated receptacles.
6. The resident will be evaluated on admission to determine if he or she is a smoker or non-smoker. If a smoker, the evaluation will include:
 - a. current level of tobacco consumption;
 - b. method of tobacco consumption (traditional cigarettes; electronic cigarettes; pipe, etc.);
 - c. desire to quit smoking, if a current smoker; and
 - d. ability to smoke safely with or without supervision (per a completed *Safe Smoking Evaluation*).
7. The staff shall consult with the attending physician and the director of nursing services to determine if safety restrictions need to be placed on a resident's smoking privileges based on the *Safe Smoking Evaluation*.
8. A resident's ability to smoke safely will be re-evaluated quarterly, upon a significant change (physical or cognitive) and as determined by the staff.
9. Any smoking-related privileges, restrictions, and concerns (for example, need for close monitoring) shall be noted on the care plan, and all personnel caring for the resident shall be alerted to these issues.
10. The facility may impose smoking restrictions on a resident at any time if it is determined that the resident cannot smoke safely with the available levels of support and supervision.
11. Any resident with restricted smoking privileges requiring monitoring shall have the direct supervision of a staff member, family member, visitor or volunteer worker at all times while smoking.
12. Residents who have independent smoking privileges are permitted to keep cigarettes, e-cigarettes, pipes, tobacco, and other smoking articles in their possession. Only disposable safety lighters are permitted. All other forms of lighters, including matches, are prohibited.
13. Residents are not permitted to give smoking articles to other residents.
14. Residents without independent smoking privileges may not have or keep any smoking articles, including cigarettes, tobacco, etc., except when they are under direct supervision.

continues on next page

15. Staff members and volunteer workers are not permitted to purchase and/or provide any smoking articles for residents.
16. This facility maintains the right to confiscate smoking articles found in violation of our smoking policies.
17. Confiscated resident property will be itemized and ultimately returned to the resident, or his or her legal representative. When the property is returned will be determined during a meeting with the resident or representative regarding the circumstances that led to the confiscation.

Suicide Threats

Policy Statement

Resident suicide threats shall be taken seriously and addressed appropriately.

Policy Interpretation and Implementation

1. Staff shall report any resident threats of suicide immediately to the nurse supervisor/charge nurse.
2. The nurse supervisor/charge nurse shall immediately assess the situation and shall notify the charge nurse/supervisor and/or director of nursing services of such threats.
3. A staff member shall remain with the resident until the nurse supervisor/charge nurse arrives to evaluate the resident.
4. After assessing the resident in more detail, the nurse supervisor/charge nurse shall notify the resident's attending physician and responsible party, and shall seek further direction from the physician.
5. All nursing personnel and other staff involved in caring for the resident shall be informed of the suicide threat and instructed to report changes in the resident's behavior immediately.
6. As indicated, a psychiatric consultation or transfer for emergency psychiatric evaluation may be initiated.
7. If the resident remains in the facility, staff will monitor the resident's mood and behavior and update care plans accordingly, until a physician has determined that a risk of suicide does not appear to be present.
8. Staff shall document details of the situation objectively in the resident's medical record.

Unusual Occurrence Reporting

Policy Statement

As required by federal or state regulations, our facility reports unusual occurrences or other reportable events which affect the health, safety, or welfare of our residents, employees or visitors.

Policy Interpretation and Implementation

1. Our facility will report the following events to appropriate agencies:
 - a. Earthquakes, floods, gas explosions, severe fires, power outages or other calamities that damage the facility or threaten the welfare, safety or health of residents, employees or visitors;
 - b. An outbreak of any communicable disease;
 - c. Poisonings;
 - d. Death of a resident, employee or visitor because of unnatural causes (e.g., suicide, homicide, accidents, etc.);
 - e. Actual or threatened employee walkouts/strikes, or other curtailment of services, or interruption of essential services (e.g., heating, air conditioning, food, water, linens, sewage or needed medical supplies) provided by the facility;
 - f. Inoperable emergency systems, equipment or resident call systems, which if not corrected could readily become life-threatening;
 - g. Allegations of abuse, neglect and misappropriation of resident property; and
 - h. Other occurrences that interfere with facility operations and affect the welfare, safety, or health of residents, employees or visitors.
2. Unusual occurrences shall be reported via telephone to appropriate agencies as required by current law and/or regulations within twenty-four (24) hours of such incident or as otherwise required by federal and state regulations.
3. A written report detailing the incident and actions taken by the facility after the event shall be sent or delivered to the state agency (and other appropriate agencies as required by law) within forty-eight (48) hours of reporting the event or as required by federal and state regulations.
4. The administration will keep a copy of written reports on file.

Water Temperatures, Safety of

Policy Statement

Tap water in the facility shall be kept within a temperature range to prevent scalding of residents.

Policy Interpretation and Implementation

1. Water heaters that service resident rooms, bathrooms, common areas, and tub/shower areas shall be set to temperatures of no more than _____° F (_____° C), or the maximum allowable temperature per state regulation.
2. Maintenance staff is responsible for checking thermostats and temperature controls in the facility and recording these checks in a maintenance log.
3. Maintenance staff shall conduct periodic tap water temperature checks and record the water temperatures in a safety log.
4. If at any time water temperatures feel excessive to the touch (i.e., hot enough to be painful or cause reddening of the skin after removal of the hand from the water), staff will report this finding to the immediate supervisor.
5. Direct-care staff shall be informed of risk factors for scalding/burns that are more common in the elderly, such as:
 - a. decreased skin thickness;
 - b. decreased skin sensitivity;
 - c. peripheral neuropathy;
 - d. reduced reaction time;
 - e. decreased cognition;
 - f. decreased mobility; and
 - g. decreased communication.
6. The length of exposure to warm or hot water, the amount of skin exposed, and the resident's current condition affect whether or not exposure to certain temperatures will cause scalding or burns. Therefore, ongoing resident observation and assessment during prolonged exposure to warm or hot water will help to determine the safety of the situation.
7. Nursing staff will be educated about signs and symptoms of burns (first, second, and third degree) so that such injuries can be recognized and treated appropriately.
8. If a resident is scalded or burned, nursing staff shall follow pertinent first aid and physician notification protocols and report the injury to his or her direct supervisor.

Proper Use of Side Rails

Level II

Purpose

The purposes of these guidelines are to ensure the safe use of side rails as resident mobility aids and to prohibit the use of side rails as restraints unless necessary to treat a resident's medical symptoms.

Definition

Physical restraints are defined by the Centers for Medicare and Medicaid Services (CMS) as any manual method or physical or mechanical device, material, or equipment attached or adjacent to the resident's body that the individual cannot remove easily which restricts freedom of movement or normal access to one's body. (*Note: The definition of restraints is based on the functional status of the resident and not on the device, therefore any device that has the effect on the resident of restricting freedom of movement or normal access to one's body could be considered a restraint.*)

General Guidelines

1. Side rails are considered a restraint when they are used to limit the resident's freedom of movement (prevent the resident from leaving his/her bed). (Note: The side rails may have the effect of restraining one individual but not another, depending on the individual resident's condition and circumstances.)
2. Side rails are only permissible if they are used to treat a resident's medical symptoms or to assist with mobility and transfer of residents.
3. An assessment will be made to determine the resident's symptoms, risk of entrapment and reason for using side rails. When used for mobility or transfer, an assessment will include a review of the resident's:
 - a. Bed mobility;
 - b. Ability to change positions, transfer to and from bed or chair, and to stand and toilet;
 - c. Risk of entrapment from the use of side rails; and
 - d. That the bed's dimensions are appropriate for the resident's size and weight.
4. The use of side rails as an assistive device will be addressed in the resident care plan.
5. Consent for using restrictive devices will be obtained from the resident or legal representative per facility protocol.
6. Less restrictive interventions that will be incorporated in care planning include:
 - a. Providing restorative care to enhance abilities to stand safely and to walk;
 - b. Providing a trapeze to increase bed mobility;
 - c. Placing the bed lower to the floor and surrounding the bed with a soft mat;
 - d. Equipping the resident with a device that monitors attempts to arise;
 - e. Providing staff monitoring at night with periodic assisted toileting for residents attempting to arise to use the bathroom; and/or
 - f. Furnishing visual and verbal reminders to use the call bell for residents who can comprehend this information.
7. Documentation will indicate if less restrictive approaches are not successful, prior to considering the use of side rails.
8. The risks and benefits of side rails will be considered for each resident.

continues on next page

9. Consent for side rail use will be obtained from the resident or legal representative, after presenting potential benefits and risks. (Note: Federal regulations do not require written consent for using restraints. Signed consent forms do not relieve the facility from meeting the requirements for restraint use, including proper assessment and care planning. While the resident or family (representative) may request a restraint, the facility is responsible for evaluating the appropriateness of that request.)
10. Manufacturer instructions for the operation of side rails will be adhered to.
11. The resident will be checked periodically for safety relative to side rail use.
12. If side rail use is associated with symptoms of distress, such as screaming or agitation, the resident's needs and use of side rails will be reassessed.
13. When side rail usage is appropriate, the facility will assess the space between the mattress and side rails to reduce the risk for entrapment (the amount of safe space may vary, depending on the type of bed and mattress being used).
14. Side rails with padding may be used to prevent resident injury in situations of uncontrollable movement disorders, but are still restraints if they meet the definition of a restraint.
15. Facility staff, in conjunction with the Attending Physician, will assess and document the resident's risk for injury due to neurological disorders or other medical conditions.

Guidelines

Guidelines for Reporting Abnormal Test Results to Physicians

Lab and Diagnostic Test Results – Clinical Protocol

Assessment and Recognition

1. The physician will identify and order diagnostic and lab testing based on the resident's diagnostic and monitoring needs.
2. The staff will process test requisitions and arrange for tests.
3. The laboratory, diagnostic radiology provider, or other testing source will report test results to the facility.

Review by Nursing Staff

1. When test results are reported to the facility, a nurse will first review the results.
 - a. If staff who first receive or review lab and diagnostic test results cannot follow the remainder of this procedure for reporting and documenting the results and their implications, another nurse in the facility (supervisor, charge nurse, etc.) should follow or coordinate the procedure.
2. Before contacting the physician, the person who is to communicate results to a physician will gather, review, and organize the information and be prepared to discuss the following (to the extent that such information is available):
 - a. The individual's current condition and details of any recent changes in status, including vital signs and mental status;
 - b. Major diagnoses, allergies, current medications, any recent pertinent lab work, actions already taken to address results and treat the resident/patient, and pertinent aspects of advance directives (for example, limitations on testing and treatment);
 - c. Why the lab and diagnostic tests were obtained (for example, as a routine screen or follow-up; to assess a condition change or recent onset of signs and symptoms, or to monitor a serum medication level;
 - d. How test results may relate to the individual's current condition and treatment; and
 - e. Any concerns and questions the physician will be expected to address regarding the resident.
3. A nurse will identify the urgency of communicating with the Attending Physician based on physician request, the seriousness of any abnormality, and the individual's current condition.
4. A nurse will try to determine whether the test was done:
 - a. As a routine screen or follow-up;
 - b. To assess a condition change or recent onset of signs and symptoms; or
 - c. To monitor a drug level.
 - (1) The reason for getting a test often affects the urgency of acting upon the result.
 - (2) If the reason for performing the test cannot be identified, the nurse should proceed as though the tests were ordered to assess a condition change or recent onset of signs and symptoms.

Identifying Situations that Warrant Immediate Notification

1. Nursing staff will consider the following factors to help identify situations requiring prompt physician notification concerning lab or diagnostic test results:
 - Whether the physician has requested to be notified as soon as a result is received.

continues on next page

- Whether the result should be conveyed to a physician regardless of other circumstances (that is, the abnormal result is problematic regardless of any other factors).
 - Whether the resident/patient's clinical status is unclear or he/she has signs and symptoms of acute illness or condition change and is not stable or improving, or there are no previous results for comparison.
2. *High or toxic serum medication levels.* If a test was obtained to monitor the blood level of a medication and the level is reported as high (above therapeutic range) or toxic, the nurse will notify the physician promptly and will not give the next dose until the situation has been reviewed with the physician.
- Laboratories may differ in their ranges of abnormal and their criteria for "panic" results.

Possible Exceptions to Immediate Notification

1. The following may potentially constitute exceptions to situations that would otherwise require immediate notification of abnormal results:
 - a. It is documented that the individual is terminally ill or is receiving only palliative care.
 - b. The results are similar to (or better than) previous results associated with chronic conditions (for example, chronic anemia or high BUN and creatinine associated with chronic renal failure) and a physician has previously been aware of those chronic abnormal results.
 - c. The physician previously left specific guidance or orders about how to deal with subsequent test results.
 - d. The results are the same as or better than previous ones, treatment has already been instituted for an acute condition change, and the individual is stable or improving.
 - e. However, nursing staff may sometimes determine that an individual's condition warrants immediate reporting of lab results despite these exceptions.

Determining the Reason for Testing

1. If the results do not meet the preceding criteria for immediate notification, then the nursing staff will review why the test was obtained, as well as the resident's current clinical status including the presence of any signs and symptoms.
 - a. If the resident has signs and symptoms of acute illness or condition change and he/she is not stable or improving, or there are no previous results for comparison, then the nurse will notify the physician promptly to discuss the situation, including a description of relevant clinical findings as well as the test results.
 - b. If the individual is stable or improving and the results do not warrant immediate notification, then the nursing staff may notify the physician routinely (for example, a stable individual with slightly abnormal follow-up test results, or low or therapeutic drug blood levels)..

Options for Physician Notification

1. A physician can be notified by phone, fax, voicemail, e-mail, mail, pager, or a telephone message to another person acting as the physician's agent (for example, office staff).
 - a. Facility staff should document information about when, how, and to whom the information was provided and the response. This should be done in the Progress Notes section of the medical record and not on the lab results report, because test results should be correlated with other relevant information such as the individual's overall situation, current symptoms, advance directives, prognosis, etc.

continues on next page

- b. Direct voice communication with the physician is the preferred means for presenting any results requiring immediate notification, especially when the resident's clinical status is unstable or current treatment needs review or clarification.
 - c. For information that does not need immediate physician response, staff may use alternatives such as faxing, voice mail, or a clipboard in the facility.
2. Alternatively, the staff and physician may also establish designated times during the day when they will review test results with the physician by phone.

Physician Responses

1. Time frames. A physician will respond within an appropriate time frame, based on the request from nursing staff and the clinical significance of the information.
 - a. A physician should respond within one hour regarding a lab test result requiring immediate notification, and by the end of the next office day to a non-emergency message regarding non-immediate lab test notification with a request for response (for example, by late Wednesday afternoon for a call made on Tuesday).
 - b. If the Attending or Covering Physician does not respond to immediate notification within an hour, the nursing staff should contact the Medical Director for assistance.
2. Physician decisions. When responding to notification of test results, the physician and staff will discuss the implications of the test results for the resident, as well as subsequent actions; for example, obtaining additional tests, new or modified medication orders, additional monitoring, etc.
3. When necessary to help explain clinical decisions, a physician or mid-level practitioner should document the basis for conclusions about how the results were addressed; for example, at the next scheduled or interim visit. The following are examples of potentially pertinent documentation:
 - a. Dilantin level "sub-therapeutic": "Individual is stable, has been seizure free for the past year. Therefore, current Dilantin dose is adequate despite low blood level."
 - b. BUN 32, creatinine 0.7: "BUN is mildly elevated, but individual shows no clinical signs of fluid or electrolyte imbalance and eats and drinks adequately. Still needs vigorous diuretic therapy because of recurrent congestive heart failure. Will recheck in case of change in condition and may consider diuretic adjustment if BUN continues to rise."
 - c. Hematocrit 32: "Hematocrit is low but has been stable. No evidence of GI bleeding. Not on any medications that could be causing blood loss. Has no symptoms that might be related to anemia. Iron levels normal; ferritin levels slightly increased. Probable diagnosis is anemia of chronic disease. No treatment indicated at present."

continues on next page

Referral of Problems and Concerns About the Process

1. Physicians or nurses who have concerns about how test results have been handled or reported should communicate such concerns to the DON and/or Medical Director.
 - a. Such concerns or disagreements should not prevent timely, clinically appropriate management of a current result or clinical situation.

Culture Tests

Policy Statement

Culture tests will only be performed when ordered by a physician.

Policy Interpretation and Implementation

1. Should the attending physician order cultures, they shall be obtained and completed as soon as practical. All test results shall be reported to the physician as soon as the results are obtained.
2. Cultures of purulent exudate at a break in the skin may be obtained by the charge nurse. An order from the physician must be obtained before the specimen is sent to the laboratory.
3. Urine cultures may be obtained by the charge nurse if a resident develops cloudy urine or other signs of urinary tract infection. An order from the physician must be obtained before the specimen is sent to the laboratory.
4. Cultures necessary for the investigation of known or suspected *Methicillin Resistant Staphylococcus aureus* (MRSA) and following eradication protocols may be ordered by the infection preventionist under the direction of the medical director.
5. Following acute diarrheal illness in employees, stool cultures may be obtained by the infection preventionist under the direction of the medical director.
6. *Salmonella* and *Shigella* follow-up stool cultures may be obtained by the infection preventionist, under the direction of the medical director, forty-eight (48) hours after the discontinuance of antimicrobials.
7. In emergency situations, the medical director shall have the administrative authority, accountability, and responsibility to:
 - a. request and order screening, surveillance and follow-up cultures as necessary.
 - b. report laboratory findings to the health department, as appropriate.
8. Completed culture reports shall be reviewed by the infection preventionist and the infection control committee and filed in accordance with established recordkeeping requirements.

Test Results

Policy Statement

The resident's attending physician will be notified of the results of diagnostic tests.

Policy Interpretation and Implementation

1. Results of laboratory, radiological, and diagnostic tests shall be reported in writing to the resident's attending physician or to the facility.
2. Should the test results be provided to the facility, the attending physician shall be promptly notified of the results.
3. The director of nursing services, or charge nurse receiving the test results, shall be responsible for notifying the physician of such test results.
4. Signed and dated reports of all diagnostic services shall be made a part of the resident's medical record.

24-Hour Urine Specimen

Level II

Purpose

The purpose of this procedure is to collect a 24-hour urine specimen for laboratory analysis.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Bedpan or urinal (with cover);
2. Graduate (measuring container);
3. Urine specimen container (1 gallon plastic bottle w/lid);
4. Funnel (if bottle opening is small);
5. Label;
6. Pen/Pencil;
7. Paper towels;
8. Bucket with ice;
9. "24-Hour Urine Specimen" tag (2); and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident is able, allow him/her to collect the specimen.
4. Instruct the resident to urinate in the bedpan, urinal or specimen.
5. Instruct the resident not to put any toilet tissue into the specimen, bedpan or urinal. (Note: If the resident wishes to use toilet tissue, instruct the resident to discard the used tissue into the trash receptacle beside the bed.)
6. Prepare the label for the gallon container. Record the resident's name, room number, date and time.
7. Attach the label to the gallon container. Place the container in the resident's bathroom.
8. Place one "24-Hour Urine Specimen" tag in the resident's bathroom, and the second tag on the resident's bed to alert all personnel that a 24-hour urine specimen is to be collected.
9. Put on gloves.
10. Once the resident has finished using the bedpan or urinal, take the container into the resident's bathroom. (Note: If this is the first specimen of the 24-hour period, pour it down the commode. Do not pour it into the gallon container.)
11. Pour the urine from the bedpan, specimen or urinal into the measuring container. Observe the urine for color, sediments, blood, odor, etc.

continues on next page

12. If the resident is on output, record this data on the intake and output record.
13. Pour the urine into the gallon container. Use the funnel as necessary.
14. Place the lid securely on the specimen container.
15. Save all the urine during the 24-hour period.
16. Place the gallon container into a bucket and fill the bucket with ice.
17. Rinse the bedpan, specimen or urinal. Store in designated area.
18. Rinse the measuring cup and funnel. Store in designated area.
19. Check to see if the resident needs any assistance in cleaning himself or herself. Assist as necessary.
20. Allow the resident to wash his/her hands.
21. Remove gloves. Discard into the designated container. Wash and dry your hands thoroughly.
22. Reposition the bed covers. Make the resident comfortable.
23. Place the call light within easy reach of the resident.
24. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
25. Wash and dry your hands thoroughly.
26. Repeat the procedure for each urine specimen collected.
27. When the last specimen of the 24-hour period has been collected, add this to the gallon container.
28. Take the gallon container, ice bucket, measuring container and funnel to the soiled utility room at the nurses' station.
29. Clean, sanitize and store all reusable equipment.
30. Send the 24-hour urine specimen to the laboratory for testing as ordered.
31. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. The character, clarity and color of urine.
4. All assessment data obtained during the procedure.
5. The date and time the 24-hour period began and ended.
6. The time each specimen was collected.
7. The date and time the specimen was sent to the lab.
8. How the resident tolerated the procedure.
9. If the resident refused the procedure, the reason(s) why and the intervention taken.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Blood Sampling – Capillary (Finger Sticks)

Level III

Purpose

The purpose of this procedure is to guide the safe handling of capillary-blood sampling devices to prevent transmission of bloodborne diseases to residents and employees.

Equipment and Supplies

1. Alcohol pledgets;
2. Disinfected blood glucose meter (glucometer) with sterile lancet; *or* single-resident use spring-loaded device (e.g., Penlet) *or* automatic or safety type lancet;
3. Disposable lancet;
4. Personal protective equipment (e.g., gloves);
5. Sharps container; and
6. Approved EPA registered disinfectant for cleaning of sampling device.

General Guidelines

1. Always ensure that blood glucose meters intended for reuse are cleaned and disinfected between resident uses. Single-resident use fingerstick devices (pen-like devices) should never be used by more than one resident.
2. The lancets and platforms must always be changed after use on each resident.
3. Handle the lancet as a used needle.

Steps in the Procedure

1. Wash hands.
2. Don gloves.
3. Place blood glucose monitoring device on clean field.
4. Place a new lancet and disposable platform on the spring-loaded finger-stick device.
5. Wipe the area to be lanced with an alcohol pledget.
6. Obtain the blood sample, following the manufacturer's instructions for the device.
7. Discard lancet and platform into the sharps container.
8. Following the manufacturer's instructions, clean and disinfect reusable equipment, parts, and/or devices after each use.
9. Remove gloves, and discard into appropriate receptacle.
10. Wash hands.
11. Replace blood glucose monitoring device in storage area after cleaning.

Clean Catch Urine Specimen

Level III

Purpose

The purpose of this procedure is to collect a clean catch urine specimen for laboratory analysis.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Do not catch the initial flow or the last few drops of urine. (Note: The initial flow of urine washes out the urethral opening and contains debris. The last few drops may contain other body secretions.)
2. Remove the specimen container from the flow of urine before the flow of the urine stops.
3. If the resident is collecting the specimen, be sure that clear instructions are given to the resident on how to collect the specimen.
4. Do not touch the inside of the specimen container or the inside of the lid.
5. Place the lid on the specimen container as soon as the specimen is obtained.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. 4x4 sponges or towelettes (3);
2. Antiseptic solution;
3. Label;
4. Pen/pencil;
5. Urine specimen container (with lid);
6. Paper towels;
7. Tissue paper;
8. Clear plastic specimen bag;
9. Bedpan/urinal (if resident is unable to leave bed); and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident is able, allow him or her to collect the specimen. Assist the resident as necessary. (Note: Instruct the resident not to touch the inside of the specimen container.)
4. If the resident cannot leave the bed, instruct the resident to urinate into the bedpan or urinal.
5. Remove the lid from the specimen container. Do not touch the inside of the lid.

continues on next page

6. **Preparing the female resident:**
 - a. Instruct the resident to separate the labia.
 - b. Using a 4x4 sponge soaked with an antiseptic or soap solution (or towelette), wipe from the front to the back on one side. Discard the sponge or towelette into the designated container. (Note: Use the sponge or towelette only once.)
 - c. Follow the same procedure for the other side. Again, wipe from front to back. Discard the towelette into the designated container.
 - d. Follow the same procedure for wiping down the middle. Again, wipe from the front to the back. Discard the sponge or towelette into the designated container.
 - e. Keep the labia separated until the urine specimen has been obtained.
7. **Preparing the male resident:**
 - a. If the resident is not circumcised, retract the foreskin.
 - b. Using a circular motion, wash the glans with a 4x4 sponge soaked with an antiseptic or soap solution. After each circle, discard the sponge or towelette into the designated container.
 - c. Keep the foreskin retracted until the urine specimen has been obtained.
8. If the resident is collecting the specimen, instruct him or her not to catch the specimen until after he or she begins urinating.
9. Place the lid on the specimen container. Be sure that you do not touch the inside of the lid. Secure the lid.
10. Prepare the label for the container. Record the resident's name, room number, and the date and time.
11. Place the label on the specimen container.
12. Put the specimen container into the clear plastic bag. Seal the bag.
13. Record output as indicated. Pour the remaining urine down the commode. Flush the commode.
14. Check to see if the resident needs assistance in cleaning himself or herself. Assist as necessary.
15. Allow the resident to wash his or her hands.
16. Rinse the bedpan or urinal. Store in designated area.
17. Remove gloves. Discard into the designated container.
18. Wash your hands.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
22. Send the specimen to the lab for testing as ordered.
23. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. The character, clarity and color of urine.
4. All assessment data obtained during the procedure.
5. The data and time the specimen was sent to the lab.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Collecting a Urine Specimen from a Closed Drainage System

Level III

Purpose

The purpose of this procedure is to obtain an uncontaminated urine specimen from a resident with a catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Do not touch the inside of the specimen container or the inside of the lid.
2. Place the lid on the specimen container as soon as the specimen is obtained.
3. Do not leave the bedside after you have clamped the catheter tubing.
4. Do not leave clamps on the catheter tube any longer than necessary to collect the specimen.
5. Use caution when handling needles to avoid needlestick injuries.

Equipment and Supplies

The following equipment and supplies will be necessary when collecting a urine specimen from a closed drainage system:

1. Alcohol swab;
2. Needle and syringe (capped);
3. Specimen container (with lid);
4. Label;
5. Pen or pencil;
6. Clear plastic specimen bag;
7. Plastic trash bag;
8. Paper towel;
9. Sharps container; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Note: In most facilities, a disposable collection kit is used to obtain this specimen. However, the equipment is listed to familiarize you with the equipment should a kit not be available.

continues on next page

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place equipment on the bedside stand or overbed table. Arrange your supplies so that they can be easily reached.
3. Close the clamp on the drainage tube below the speci-port. (Note: Do not leave the resident after you have clamped the tube. Leave the clamp in place only long enough to collect the specimen.)
4. Cleanse the speci-port with the alcohol swab. Discard the swab into the designated container.
5. Remove the needle cover from the syringe.
6. Insert the needle into the speci-port. Pull gently back on the plunger to obtain the required amount of urine. (Note: Usually two [2] ccs are required.)
7. Remove the needle and syringe from the speci-port. Cleanse the speci-port with an alcohol swab.
8. Open the clamp from drainage tubing. Be sure the urine is now running freely down the tubing into the collection bag.
9. Place the needle of the syringe into the specimen container. Push the plunger to expel the urine into the specimen container. Do not touch the inside of the specimen container.
10. Place the lid on the specimen container. Do not touch the inside of the lid.
11. Prepare the label for the container. Record the resident's name, room number, and the date and time.
12. Place the label on the container.
13. Put the specimen container into the clear plastic bag. Seal the bag.
14. Discard the needle and syringe into designated sharps container. (Note: Do not recap the needle.)
15. Remove protective clothing, if worn. Discard into the designated container.
16. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the door and curtains to the open position.
20. Discard all used disposable supplies into designated containers. Remove from room and discard into designated containers.
21. Place soiled reusable equipment into a plastic trash bag. Tie the bag.
22. As you leave the room, take the trash bags with you to the soiled utility room.
23. If the resident desires and if visitors are waiting, tell them that they may now enter the room.
24. Give the specimen to the staff/charge nurse.
25. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. The character, clarity and color of urine.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Cultures for MRSA (Staphylococcus Screening)

Level III

Purpose

The purpose of this procedure is to provide guidelines for proper culturing of residents known or suspected to have Methicillin Resistant Staphylococcus Aureus (MRSA) infection, or who may be exposed to MRSA. (This is not a routine procedure but may be needed during an outbreak or upon advice of the local or state health department.)

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

For Nasal Culture

1. Clean gloves; and
2. Sterile culture swab.

For Wound Culture

1. Sterile gloves;
2. Sterile culture swab;
3. Sterile general purpose tray;
4. Alcohol sponges; and
5. Betadine sponges (or ACU-dyne).

Procedure Guidelines

1. Mark the laboratory request with the following:
 - a. The exact location of the wound; or
 - b. "Anterior nares," if appropriate;
 - c. "Staphylococcus screen, R/O MRSA";
 - d. Resident's name and room number;
 - e. Name of person taking culture; and
 - f. Date.

Nasal Culture

1. Validate Physician's order for the culture.
2. Wash hands and put on clean gloves.
3. Using thumb, gently elevate nares by pushing up on tip of nose.
4. Insert sterile culture swab into anterior tips of nares, rotate swab to collect any moisture.
5. Remove swab from nose and replace in sheath.
6. Squeeze capsule to release culture medium. Be sure swab is in medium.
7. Discard gloves and other protective equipment into appropriate receptacle. Wash hands.
8. Label specimen and send to lab.

Wound Culture

1. Validate Physician's order for the culture.
2. Wash hands, open the general equipment tray and put on sterile gloves.
3. Using sterile forceps, remove the dressings to expose the wound.

continues on next page

4. Cleanse the area around the wound with alcohol and then cleanse with Betadine sponges (if resident not allergic). Remove all old drainage from site.
5. Allow the area to dry.
6. Using the sterile culture swab, collect as much fresh drainage as possible, or insert the swab gently into any open, draining area of the wound and rotate it to obtain drainage. Never collect drainage from the outside and then insert the same swab into the wound.
7. Place the swab back into the sheath and squeeze the capsule to release the culture medium.
8. Remove the sterile gloves and discard into appropriate receptacle. Wash hands.
9. Label specimen and send to lab.

(Note: A swab culture is not recommended for a pressure ulcer. All pressure ulcers are colonized with bacteria and the culture will only detect surface colonization and may not reflect the organism responsible for the infection. Notify the physician if infection is suspected.)

Miscellaneous

1. Implement Contact Precautions on a case-by-case basis as determined by risks for transmission including uncontrolled secretions, stool incontinence, draining wounds, diarrhea, and total dependence for activities of daily living.
2. Do not treat or continue to culture asymptomatic colonized individuals unless the realistic clinical goal is to decolonize the individual.
3. A resident who has recently had MRSA bacteremia does not need additional blood cultures once his/her clinical condition has improved.
4. Prioritize known MRSA residents for placement with like MRSA individuals, or a low risk individual.
5. When notification of previous MRSA infection or colonization comes after admission, make decisions on surveillance and precautions based on the individual's ability to contain infected/colonized body fluids or body sites, personal hygiene (e.g., handwashing, keeping hands away from infected/colonized areas) and risk to other residents.
6. Place culture tubes in clear plastic bags for transport.

Version	1.2 (H5MAPR0092)

Cultures, Specimen Collection for

Level III

Purpose

Correct collection and handling of culture specimens helps ensure more accurate and timely results and subsequent treatment.

Procedure Guidelines

1. Labeling of the specimen must include:
 - a. Resident name;
 - b. Location of resident (room and bed number);
 - c. Physician ordering;
 - d. Date and time specimen collected;
 - e. Source of specimen;
 - f. Test desired; and
 - g. Name of person collecting specimen.
2. Explain the procedure completely to the resident.
3. Stay with the resident during the specimen collection if practical.
4. Use a sterile container (except for stool cultures).
5. Label the specimen correctly and send it to the laboratory.
6. Avoid contamination of the container.
7. Place all specimens in a secondary plastic bag with an appropriate biohazard label to contain spills.

Equipment and Supplies

For Throat Culture

1. Gloves;
2. Mask and goggles/face shield (if indicated);
3. Sterile culture swab;
4. Tongue blade; and
5. Penlight.

For Nasopharyngeal Culture

1. Flexible cotton tipped wire;
2. Penlight;
3. Lab personnel at bedside with culture plates (or sterile container if lab unavailable); and
4. Clean gloves.

For Nasal Culture

1. Sterile culture swab; and
2. Clean gloves.

continues on next page

For Eye Culture

1. Sterile gloves;
2. Sterile culture swab;
3. Sterile normal saline solution; and
4. Sterile 2 x 2 gauze pads.

For Ear Culture

1. Clean gloves;
2. Sterile culture swab;
3. Sterile normal saline solution; and
4. Sterile 2 x 2 gauze pads.

For Rectal Culture

1. Clean gloves;
2. Sterile culture swab; and
3. Washcloth, soap, and water.

For Wound Culture

1. Sterile gloves;
2. Sterile general purpose tray;
3. Alcohol sponges;
4. Betadine sponges (or ACU-dyne); and
5. Sterile culture swab.

For Vaginal Culture

1. Clean gloves;
2. Sterile culture swab;
3. Sterile normal saline solution; and
4. Antiseptic solution.

Swabs of Skin Surfaces

1. Sterile culture swab;
2. Sterile normal saline solution; and
3. Clean gloves.

Stool Culture

1. Clean specimen container with lid;
2. Bedpan or bedside commode; and
3. Clean gloves.

Urine Culture From Indwelling Catheter

1. Alcohol sponge;
2. Syringe;
3. Sterile needle;
4. Sterile specimen container; and
5. Clean gloves.

continues on next page

Steps in the Procedure

Throat Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on clean gloves. (Use a mask and eyewear if splashing, spraying, or spattering of blood or saliva is likely.)
4. Explain to the resident that he/she may gag during collection.
5. Ask the resident to sit up if possible.
6. Ask the resident to tilt head back, if possible.
7. Depress the tongue using the tongue blade and illuminate the throat using a penlight.
8. Swab the tonsillar areas from side to side, including any inflamed or purulent sites. Do not touch the tongue, cheeks, or teeth with the swab.
9. Withdraw the swab and place it in the sheath, immediately crush the ampule of culture medium at the bottom of the tube. Push the swab into the medium to keep it moist.
10. Label the specimen.
11. Discard gloves and other protective equipment into appropriate receptacles. Wash hands.
12. Label the specimen and send to the lab.

Nasopharyngeal Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on clean gloves.
4. Tell the resident he/she may gag or feel the urge to sneeze during the procedure.
5. Ask the resident to sit up if possible.
6. Ask the resident to blow his/her nose if possible.
7. Tell the resident to occlude one nostril and then the other as he/she exhales. Insert the swab tube into the more patent nostril.
8. Ask the resident to cough.
9. Open the package containing the swab and carefully bend the wire into a curve, maintaining sterility.
10. Ask the resident to tilt his/her head back and then pass the swab through the nostril about 3–4 inches, keeping it near the nasal septum and floor of the nose.
11. Rotate the swab quickly, then withdraw it and give to the lab person standing at bedside, or insert contaminated end of wire into sterile container and break, seal cap.
12. Discard gloves and other protective equipment into an appropriate receptacle. Wash hands.
13. Label the specimen and send to the lab.

Nasal Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on clean gloves.
4. Using your thumb, gently elevate the nares by pushing up on the tip of the nose.
5. Insert a sterile culture swab into the anterior tips of the nares, and rotate the swab to collect any moisture.
6. Remove the swab from the nose and replace in the sheath.
7. Squeeze the capsule to release the culture medium. Be sure the swab is in the medium.
8. Discard gloves and other protective equipment into an appropriate receptacle. Wash hands.
9. Label the specimen and send to the lab.

continues on next page

Eye Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on sterile gloves.
4. Gently clean excess debris from the outside of the eye with sterile normal saline solution and gauze pads, wiping from inner to outer corners.
5. Retract the lower eyelid to expose the conjunctival sac. Gently rub a sterile swab over the conjunctiva (hold the swab parallel to the eye, rather than pointing it directly at the eye).
6. Place the swab immediately into the sheath and squeeze the ampule to release the culture medium.
7. Remove gloves and discard into appropriate receptacle. Wash hands.
8. Label the specimen and send immediately to the lab.

Ear Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on clean gloves.
4. Clean excess debris from the ear with sterile normal saline solution and gauze pads.
5. Insert the swab into the ear canal and rotate it gently along the walls of the canal.
6. Withdraw the swab, being careful not to touch any other surfaces.
7. Place the swab into the sheath and squeeze the capsule to release the culture medium.
8. Remove gloves and discard into an appropriate receptacle. Wash hands.
9. Label the specimen and send to the lab.

Rectal Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands, put on clean gloves.
4. Clean the area around the anus with soap and water.
5. Insert the swab, moistened with sterile normal saline into the anus and advance it (about 1 1/2 inches). While withdrawing the swab, gently rotate it against the walls of the lower rectum.
6. Place the swab into the sheath and squeeze the capsule to release the culture medium. Be sure the swab is in the medium.
7. Remove gloves and discard into appropriate receptacle. Wash hands.
8. Label the specimen and send to the lab.

Wound Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on gloves.
4. Remove the dressings to expose the wound.
5. Cleanse the wound area with normal saline, removing all old drainage from wound bed.
6. Allow the area to dry.
7. Using the sterile culture swab, collect as much fresh drainage as possible, or insert the swab gently into any open, draining area of the wound and rotate it to obtain drainage. Never collect drainage from the outside and then insert the same swab into the wound. Don't just swab the surface of the wound.
8. Place the swab back into the sheath and squeeze the capsule to release the culture medium.

continues on next page

9. Remove the sterile gloves and discard into appropriate receptacle. Wash hands.
10. Label the specimen and send to the lab.

Vaginal Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on gloves.
4. With gloved hand, separate labia and cleanse the area with antiseptic solution (if the resident not allergic).
5. Moisten the swab with sterile saline.
6. Insert the swab into vagina with labia still separated and obtain culture.
7. In withdrawing the swab, take care not to contaminate with rectal organisms.
8. Place the swab in sheath and squeeze capsule to release culture medium. Be sure the swab is in medium.
9. Remove gloves and discard into appropriate receptacle. Wash hands.
10. Label the specimen and send to the lab.

Swabs of Skin Surfaces

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Wash hands and put on clean gloves.
4. Moisten sterile swab with sterile normal saline solution.
5. Roll moistened sterile swab over surface to be cultured.
6. If lesion is purulent, clean it out first with sterile swab sticks, then use a sterile specimen swab to take the specimen.
7. Place the swab in sheath and squeeze capsule to release culture medium. Be sure the swab is in medium.
8. Remove gloves and discard into appropriate receptacle. Wash hands.
9. Label the specimen and send to the lab.

Stool Culture

1. Validate the Physician's order for culture.
2. Explain procedure to resident.
3. Tell the resident to notify you when he has the urge to defecate.
4. Have the resident defecate into a clean, dry bedpan or commode.
5. Instruct the resident to try to avoid contaminating the specimen with urine or toilet tissue.
6. Put on clean gloves.
7. Use a scoop attached to top of stool specimen container to obtain stool. A specimen the size of a pea pod is sufficient.
8. Place the specimen in container and close cap tightly.
9. Label the container.
10. Remove gloves and discard into appropriate receptacle. Wash hands.
11. Label the specimen and send to lab.

Urine Culture From Indwelling Catheter

1. Validate the Physician's order for culture.
2. Approximately 30 minutes prior to collecting the specimen, clamp the collection tube to allow urine to accumulate.
3. Put on gloves.
4. Wipe the sampling port with an alcohol sponge.

continues on next page

5. Connect a needle to a syringe and uncap the needle.
6. Insert the needle into the sampling port at a 90° angle to the tubing.
7. Aspirate the specimen into the syringe.
8. Transfer the specimen to a sterile container.
9. Unclamp the drainage tube.
10. Remove gloves and discard into appropriate receptacle.
11. Wash hands.
12. Label the specimen and send to the lab.

Special Considerations

1. For a wound specimen, although you would normally cleanse the area around the wound to prevent contamination by normal skin flora, do not cleanse a perineal wound area with alcohol, to avoid irritating sensitive tissue.
2. Be sure antiseptic does not enter the wound.
3. Document the time, date, and site of the specimen collection. Note any unusual appearance or odor of the specimen.
4. Dry swabs from dry wounds are not acceptable; surface swabs from wounds are of little if any value.

Culturing for Catheter-Related Infections

Level III

Purpose

The purpose of this procedure is to provide guidelines for the aseptic culturing of a suspected source of contamination in order to supply the microbiology lab with information needed to identify the microorganisms associated with catheter-related infections.

Preparation

1. A physician's order is required to draw blood for culture or to culture the catheter tip after removal of catheter.
2. Follow laboratory specific procedures for collection of specimen.
3. Verify with state Nurse Practice for RN/LPN scope of practice for this procedure.

General Guidelines

1. This is a sterile procedure. Use only sterile scissors and collection container for specimen collection. If the collection bottle is not part of a sterile collection kit, disinfect the rubber stopper of the bottle with alcohol swab prior to collecting the specimen.
2. Obtain blood cultures from a peripheral venipuncture site. If a catheter-related blood stream infection is suspected, another culture may be taken from the CVAD. Do not obtain blood cultures from peripheral or mid line catheters. Obtain blood specimen for culture before obtaining blood for other tests.
3. Include catheter segments (tip and/or subcutaneous segment), the delivery system, the access site, and infusate solution in cultures for suspected infusion-related and/or catheter-related infection. To obtain specimen from suspected contaminated catheter, remove the catheter by holding the hub to avoid touching the portion of the catheter that has been under the skin.
4. When culturing drainage from insertion site:
 - a. Culture drainage before removing catheter.
 - b. *Do not clean* area before culturing drainage.
 - c. Keep the sterile swab that is used to collect culture from touching anything except the drainage.
5. Routine culturing of all central vascular access device tips upon removal is not recommended.
6. Removal of a functioning CVAD based on temperature elevation alone is not recommended.
7. Salvaging the catheter should be a decision made by the practitioner, the nurse and the resident or representative based on the following criteria:
 - a. The type of vascular access device;
 - b. Anticipated difficulty of inserting a new device;
 - c. Whether the resident has a bleeding disorder;
 - d. The infecting organism, determined by blood cultures; and
 - e. Other complicating conditions, such as sepsis, suppurative thrombophlebitis, endocarditis, or the presence of any vascular hardware (i.e., pacemaker).
8. Infection of the implanted port or a tunneled catheter requires removal of the CVAD. However, uncomplicated infection of the exit site (i.e., no systemic infection, positive blood culture, or purulence) may be treated with topical antimicrobial ointment, as indicated by the culture results and practitioner order.

continues on next page

Equipment and Supplies

1. Central line dressing change kit;
2. Sterile scissors (suture removal kit);
3. Sterile container for placing culture to send to lab;
4. Sterile cotton swabs for drainage culture (this may come with culture tube);
5. Labels for sterile containers;
6. Venipuncture equipment, sterile gauze, tourniquet, antiseptic cleaning solution for blood cultures;
7. Saline flushes, Vacutainer® lab tubes and holder, alcohol wipes for catheter blood draws; and
8. Lab biohazard bags to place samples.

Steps in the Procedure

1. Perform hand antisepsis. Wear non-sterile gloves.
2. Discontinue any infusions for at least two minutes before obtaining blood cultures. Flush with at least 5 mL of 0.9% sodium chloride to clear catheter of medications.
3. Remove old dressing if catheter insertion site drainage is to be cultured.

To obtain blood sample from central venous access device:

1. Refer to procedure for obtaining blood specimens from a central venous catheter.
2. If cultures of drainage and/or tip are also ordered, obtain blood sample from CVAD before removing dressing or catheter.

To obtain culture from drainage at catheter-skin junction:

1. Do not cleanse the affected area.
2. Swab any drainage with sterile swab.
3. Uncap culture tube.
4. Drop swab into culture tube using aseptic technique.
5. Recap tube.

To obtain culture from catheter tip:

1. Verify order to remove catheter.
2. Verify with State Nurse Practice Act if LPN/RN with clinical competency is allowed to remove catheter.
3. Using sterile technique and supplies, remove catheter, avoiding contact with surrounding skin and environment.
4. Have second person uncap culture container, making sure that cap and container stay sterile.
5. Place catheter tip into container, and using sterile scissors cut approximately 2 inches of catheter tip into container.
6. Replace container lid tightly.
7. Finish placing pressure dressing to exit site of catheter.

To obtain culture from infusate container:

1. Disinfect injection/access port of infusate container.
2. Insert needle with syringe into access port.
3. Withdraw 3 mL of infusion solution.
4. Uncap culture tube.
5. Inject contents of syringe.
6. Recap tube.

continues on next page

To obtain blood culture (venipuncture):

1. Refer to procedure for obtaining blood specimens from a direct venipuncture.

When culture(s) are obtained:

1. Label culture with:
 - a. resident’s name;
 - b. resident’s medical record number or ID;
 - c. date and time specimen was collected; and
 - d. contents of the culture tube.
2. Place labeled cultures in lab biohazard bag and send to lab.
3. Discard used supplies.
4. Remove gloves. Perform hand antisepsis.
5. Notify physician when culture results are received.

Documentation

1. The following information should be recorded in the resident’s medical record:
 - a. The signs and symptoms of catheter-related infection, when the signs and symptoms were first discovered, and location of catheter and type of culture sent (tip, drainage, blood).
 - b. The date and time of the culture.
 - c. The condition of the resident, including vital signs and his or her response to the procedure.
 - d. Results of the culture, notification of the physician and actions taken when the results were received.
 - e. The signature and title of the person recording the data.
2. Complete an incident report if indicated by facility policy.

Reporting

1. Notify physician, Infection Preventionist, and oncoming shift of type of culture sent and results.

Fresh Fractional Urine Specimen

Level III

Purpose

The purpose of this procedure is to provide guidelines for the collection of a fresh fractional urine specimen.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Collect the fresh fractional urine specimen at the exact time it is ordered. (Note: Normally, these specimens are collected one-half hour before meal times and at bedtime.)
2. The label must be printed clearly so that it is easy to read.
3. The label must be attached to the specimen container after the specimen has been collected, not before.
4. Record the date and time you obtained the specimen on the label.
5. Fresh fractional urine specimens (collecting small amounts of fresh urine) are primarily used for conducting diabetic testing for glucose and ketones.
6. A fresh urine specimen will be needed for each time the tests are conducted.
7. Because the urine must be fresh, the resident must be instructed to urinate at least one-half hour before collecting the fresh urine. If the resident is on intake and output, the urine must be measured and recorded on the resident's intake and output record.
8. If the resident cannot void again at the time you need to collect the fresh urine specimen (thirty minutes before meal time and bedtime), inform the staff/charge nurse.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Bedpan or urinal (with cover);
2. Graduate (measuring container);
3. Urine specimen container (with lid);
4. Label;
5. Pen/Pencil;
6. Paper towels; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident is able, allow him/her to collect the specimen.

continues on next page

4. Instruct the resident to urinate in the bedpan, urinal or specipan. (Note: If this is the first voiding, it cannot be used as the fresh urine specimen. Take this urine into the bathroom. If the resident is on intake and output, measure the urine and record this data on the intake and output record. Pour the urine down the commode. Flush the commode. Rinse the bedpan or urinal and take it back to the bedside.) Have the resident urinate again in about 30 minutes.
5. Instruct the resident not to put any toilet tissue into the bedpan, urinal or specipan. (Note: If the resident wishes to use toilet tissue, instruct the resident to discard the used tissue into the trash receptacle beside the bed.)
6. Prepare the label for the container. Record the resident's name, room number, date and time.
7. Once the resident has finished using the bedpan, urinal or specipan take the container into the resident's bathroom.
8. Pour the urine into the measuring container (graduate).
9. If the resident is on output, record the amount on the intake and output sheet.
10. Pour the specified amount of urine from the measuring container into the specimen container.
11. Place the lid securely on the specimen container.
12. Place the label on the container.
13. Pour the remaining urine into the commode. Flush the commode.
14. Rinse the bedpan, urinal or specipan. Store in designated area.
15. Rinse the measuring cup.
16. Check to see if the resident needs any assistance in cleaning himself or herself. Assist as necessary.
17. Allow the resident to wash his/her hands.
18. Remove gloves. Discard into the designated container. Wash and dry your hands thoroughly.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
22. Take the urine specimen to the soiled utility room for testing.
23. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. The character, clarity and color of urine.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Obtaining Blood Specimens from a Central Venous Catheter

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic sampling of the resident's blood from a central venous catheter.

Preparation

1. A physician order is required to obtain blood samples.
2. Verify in state Nurse Practice Act regarding scope of practice for this procedure.

General Guidelines

1. All four categories of central catheters (tunneled, non-tunneled, implanted port, PICC) can be used to draw blood.
2. Always use needleless systems and aseptic technique when drawing and transferring blood.
3. Replace the needleless connection device after blood draws to prevent infection.
4. Use only 10 mL or larger barrel size syringes to draw blood from a central venous catheter to avoid too much pressure on catheter.
5. Do not attach Vacutainer® barrels directly onto a catheter, especially the PICC, as this may cause increased pressure and damage the catheter.
6. Keep the needleless connection device in place while drawing blood to avoid the possibility of air embolus while changing syringes.
7. Prior to blood sampling, verify the identity of the resident by at least two means of identification.
8. Do not obtain blood sample through an infusion administration set (IV tubing).
9. Use the pull-stop technique when obtaining blood samples from a central venous catheter.
10. Do not draw blood for therapeutic drug monitoring through the same lumen used to administer the medication.
11. Draw blood from a dedicated lumen, if possible.
12. For blood sampling through a multi-lumen catheter use the largest lumen and the lumen farthest from the heart.
13. Do not draw blood from a lumen that is being used for parenteral nutrition.
14. Do not use central lines for obtaining cultures unless there is limited peripheral vein access or the culture is to determine a catheter-related blood stream infection.

Equipment and Supplies

1. Three 10 mL syringes prefilled with normal saline;
2. One or more sterile syringes (10 mL or larger barrel size);
3. Chlorhexidine or alcohol wipes;
4. Sterile end cap/injection device;
5. Blood transfer kit (needleless);
6. Vacutainer® tubes; and
7. Non-sterile gloves.

continues on next page

Steps in the Procedure

Helpful Tips When Drawing Blood

1. All central lines can be used to draw blood. When using a PICC line, at least a 4 FR size is recommended.
2. To facilitate blood return, gently reposition the resident to a sitting or lying down position, or ask him/her to cough. If using a PICC line, you may also ask the resident to straighten his/her arm.

Obtaining Blood Specimen

1. Stop any infusions for at least 2 minutes prior to accessing the catheter.
2. Assemble supplies. Remove any air bubbles from syringes.
3. Perform hand antisepsis. Apply non-sterile gloves.
4. Attach primed saline syringe to new needleless access device (end cap, valve). Prime with 0.5 mL flush and place in clean area for use after blood draw.
5. Leave needleless access device on end of catheter. Clean end of access device with alcohol wipe.
6. Only use syringes to draw blood from catheter. Do not attach vacuum tube.
7. Attach saline syringe to end of catheter and use push-pause flush method to infuse 10 mL saline. Stop flushing when there is 0.5 mL of saline in the syringe.
8. With same saline syringe attached, withdraw 3-5 mL of blood (for waste) using pull-stop method. (Note: For cultures, do not withdraw and waste initial blood sample.)
9. Disconnect syringe with blood waste from catheter (clamp catheter if necessary).
10. Discard blood waste syringe in sharps container. Do not re-infuse blood into resident.
11. Attach 10 mL (or larger) sterile empty syringe to access device. Withdraw necessary amount of blood for needed samples. This process may be repeated with as many sterile syringes as necessary to get needed amount of blood. Place filled syringes in clean area.
12. Post blood draw, flush with 10-20 mL of normal saline using push-pause flush technique.
13. Attach new needleless connection device (end cap, valve) to catheter hub:
 - a. Clamp or kink catheter;
 - b. Ask resident to hold his/her breath;
 - c. Remove old access device;
 - d. Place new access device (screw into place);
 - e. Ask resident to release breath; and
 - f. Unclamp catheter.
14. Finish flushing with saline.
15. Remove syringe and clamp (if necessary).
16. Dispose of flush syringes in sharps container.
17. Transfer blood sample into tubes to send to lab (see below)..

Transferring Blood Sample into Laboratory Tubes:

1. Never use a needle to transfer blood. Use a needleless transfer device (according to manufacturer's instructions).
2. Transfer blood into tubes in a sequence according to lab protocol. Contact lab to see what sequence the tubes are to be filled. Some tubes have additives that could be transferred into other tubes through the transfer system and interfere with lab results.
3. Label tubes with resident's information (per lab requirements), date, time, and initials of person drawing blood.
4. Place lab paperwork and tubes into lab biohazard transport bag. Send to lab.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. Date, time of specimen collection, type of tests.
2. Site of collection.
3. Condition of resident post blood draw.
4. Laboratory results and notification of physician of results.
5. Signature and title of person who is recording/reporting data.

Reporting

1. Notify physician, supervisor, and oncoming shift of any problems or inability to get blood sample.
2. Report other information in accordance with facility policy and professional standards of practice.

Obtaining Blood Specimens from a Direct Venipuncture Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic sampling of the resident's blood via direct venipuncture.

Preparation

1. A physician order is required to obtain blood samples.
2. Verify in state Nurse Practice Act regarding scope of practice for this procedure

General Guidelines

1. If the resident has an intravenous catheter, perform venipuncture on the opposite extremity.
2. If upper extremity is edematous, paralyzed, or affected by a stroke, or has poor circulation due to radiation therapy, avoid venipuncture at this site.
3. Use the dorsum of the hand in residents with a dialysis fistula or graft.
4. Use a straight or winged needle for phlebotomy at the antecubital fossa.
5. When obtaining venipuncture blood specimen for culture, consider using a phlebotomy team or individual(s) specially trained to reduce contamination of the specimen

Equipment and Supplies

1. Straight or winged needle;
2. Chlorhexidine or alcohol wipes;
3. Tourniquet;
4. Vacutainer® tubes; and
5. Non-sterile gloves.

Steps in the Procedure

1. Disinfect venipuncture site with anti-microbial solution. Repeat two more times.
2. Allow to air dry.
3. Apply tourniquet proximal to venipuncture site.
4. Perform venipuncture:
 - a. Position resident with arm extended, in dependent position.
 - b. Select vein (antecubital fossa is preferred for blood specimen collection).
 - c. Insert phlebotomy needle (butterfly) in vein. The needle should be connected to a sterile syringe to collect blood.
 - d. If obtaining blood for culture, withdraw 5 mL of blood for waste.
 - e. Collect at least 20 mL of blood and put into two culture bottles (aerobic and anaerobic). This constitutes one blood culture. (Note: Split the 20 mL between the two bottles using a needleless transfer system.)
5. Remove tourniquet.

continues on next page

6. Remove needle and apply pressure to exit site.
7. Apply sterile dressing to venipuncture site.

Transferring Blood Sample into Laboratory Tubes:

1. Never use a needle to transfer blood. Use a needleless transfer device (according to manufacturer’s instructions).
2. Transfer blood into tubes in a sequence according to lab protocol. Contact lab to see what sequence the tubes are to be filled. Some tubes have additives that could be transferred into other tubes through the transfer system and interfere with lab results.
3. Label tubes with resident’s information (per lab requirements), date, time, and initials of person drawing blood.
4. Place lab paperwork and tubes into lab biohazard transport bag. Send to lab.

Documentation

The following information should be recorded in the resident’s medical record:

1. Date, time of specimen collection, type of tests.
2. Site of collection.
3. Condition of resident post blood draw.
4. Laboratory results and notification of physician of results.
5. Signature and title of person who is recording/reporting data.

Reporting

1. Notify physician, supervisor, and oncoming shift of any problems or inability to get blood sample.
2. Report other information in accordance with facility policy and professional standards of practice.

Obtaining Blood Specimens from a Peripheral Catheter Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic sampling of the resident's blood from a peripheral catheter.

Preparation

1. A physician order is required to obtain blood samples.
2. Verify in state Nurse Practice Act regarding scope of practice for this procedure.

General Guidelines

1. Always use needleless systems and aseptic technique when drawing and transferring blood.
2. Replace the needleless connection device after blood draws to prevent infection.
3. Use only 10 mL or larger barrel size syringes to draw blood from a peripheral catheter to avoid too much pressure on catheter.
4. Do not attach Vacutainer® barrels directly onto a catheter hub, as this may cause increased pressure and damage the catheter.
5. Keep the needleless connection device in place while drawing blood to avoid the possibility of air embolus while changing syringes.
6. Prior to blood sampling, verify the identity of the resident by at least two means of identification.
7. Do not obtain blood sample through an infusion administration set (IV tubing).
8. Do not obtain blood for cultures through a peripheral catheter, either at insertion or while indwelling.
9. Do not obtain a blood sample for any purpose at the time of catheter insertion.
10. Use the pull-stop technique when obtaining blood samples.

Equipment and Supplies

1. Two 10 mL syringes prefilled with normal saline;
2. One or more sterile syringes (10 mL or larger barrel size);
3. Chlorhexidine or alcohol wipes;
4. Sterile end cap/injection device;
5. Blood transfer kit (needleless);
6. Vacutainer® tubes; and
7. Non-sterile gloves.

Steps in the Procedure

1. Stop any infusions for at least 2 minutes prior to accessing the catheter.
2. Assemble supplies. Remove any air bubbles from syringes.
3. Perform hand antisepsis. Apply non-sterile gloves.
4. Attach primed saline syringe to new needleless access device (end cap, valve). Prime with 0.5 mL flush and place in clean area for use after blood draw.
5. Leave needleless access device on end of catheter. Clean end of access device with alcohol wipe.

continues on next page

6. Only use syringes to draw blood from catheter. Do not attach vacuum tube.
7. Attach saline syringe to end of catheter and use push-pause flush method to infuse 10 mL saline. Stop flushing when there is 0.5 mL of saline in the syringe.
8. With same saline syringe attached, withdraw 1-2 mL of blood (for waste) using pull-stop method.
9. Disconnect syringe with blood waste from catheter (clamp catheter if necessary).
10. Discard blood waste syringe in sharps container. Do not re-infuse blood into resident.
11. Attach 10 mL (or larger) sterile empty syringe to access device. Withdraw necessary amount of blood for needed samples. This process may be repeated with as many sterile syringes as necessary to get needed amount of blood. Place filled syringes in clean area.
12. Post blood draw, flush with 10-20 mL of normal saline using push-pause flush technique.
13. Attach new needleless connection device (end cap, valve) to catheter hub:
 - a. Clamp or kink catheter;
 - b. Remove old access device;
 - c. Place new access device (screw into place); and
 - d. Unclamp catheter.
14. Finish flushing with saline.
15. Remove syringe and clamp (if necessary).
16. Dispose of flush syringes in sharps container.
17. Transfer blood sample into tubes to send to lab (see below).

Transferring Blood Sample into Laboratory Tubes:

1. Never use a needle to transfer blood. Use a needleless transfer device (according to manufacturer's instructions).
2. Transfer blood into tubes in a sequence according to lab protocol. Contact lab to see what sequence the tubes are to be filled. Some tubes have additives that could be transferred into other tubes through the transfer system and interfere with lab results.
3. Label tubes with resident's information (per lab requirements), date, time, and initials of person drawing blood.
4. Place lab paperwork and tubes into lab biohazard transport bag. Send to lab.

Documentation

The following information should be recorded in the resident's medical record:

1. Date, time of specimen collection, type of tests.
2. Site of collection.
3. Condition of resident post blood draw.
4. Laboratory results and notification of physician of results.
5. Signature and title of person who is recording/reporting data.

Reporting

1. Notify physician, supervisor, and oncoming shift of any problems or inability to get blood sample.
2. Report other information in accordance with facility policy and professional standards of practice.

Routine Urinalysis Specimen

Level III

Purpose

The purpose of this procedure is to provide guidelines for the collection of a urine specimen for urinalysis.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Bedpan (with cover) or urinal;
2. Measuring container (graduated if intake and output are being recorded);
3. Urine specimen container (with lid);
4. Label;
5. Paper towels;
6. Tissue paper;
7. Pen/Pencil;
8. Clear plastic specimen bag; and
9. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident is able, allow him or her to collect the specimen. Assist the resident as necessary.
4. Instruct the resident to urinate into the bedpan or urinal.
5. Instruct the resident not to put any toilet tissue into the bedpan or urinal. (Note: If the resident wishes to use toilet tissue, instruct the resident to discard the used tissue into the trash receptacle beside the bed.)
6. Prepare the label for the container. Record the resident's name, room number, and the date and time.
7. Once the resident has finished urinating, take the bedpan or urinal into the bathroom. (Note: Cover the bedpan when removing it from the bedside.)
8. Pour the urine into the measuring container.
9. If the resident requires a measurement of output, record the amount measured on the intake and output sheet.
10. Pour the urine from the measuring container into the specimen container. Unless otherwise instructed, fill the container approximately three-fourths (3/4) full, if possible.
11. Place the lid securely on the specimen container.
12. Place the label on the specimen container.
13. Put the specimen container into the clear plastic bag. Seal the bag.

continues on next page

14. Pour the remaining urine down the commode. Flush the commode.
15. Check to see if the resident needs assistance in cleaning himself or herself. Assist as necessary.
16. Allow the resident to wash his or her hands.
17. Rinse the bedpan or urinal. Store in designated area.
18. Clean and rinse out the measuring container. (Note: Store in room or take to soiled utility room as you leave the room.)
19. Remove gloves. Discard into the designated container.
20. Wash and dry your hands thoroughly.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
24. Send the specimen to the laboratory for testing as ordered.
25. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. The character, clarity and color of urine.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Sputum Specimen

Level III

Purpose

The purpose of this procedure is to collect a sputum specimen for laboratory testing.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sputum container (with lid);
2. Label;
3. Pen or pencil;
4. Paper towels; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident has recently eaten, instruct the resident to rinse his or her mouth. Provide assistance as necessary.
4. If the resident can hold the sputum container, ask him or her to take three (3) deep breaths and on the third exhalation, to cough deep from the lungs to bring up the sputum.
5. Instruct the resident to spit into the container. (Note: If the resident cannot hold the container, hold the container up to the resident's mouth.)
6. Once the resident has produced the sputum, cover the container immediately. (Note: The resident may need to cough several times to bring up enough sputum for the specimen.)
7. Do not touch the inside of the container or the lid.
8. Label the container. Record the resident's name, room number, and the date and time you collected the specimen.
9. Remove gloves. Discard into the designated container. Wash and dry your hands thoroughly.
10. Reposition the bed covers. Make the resident comfortable.
11. Place the call light within easy reach of the resident.
12. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
13. Send the specimen to the laboratory for testing as ordered.
14. Wash and dry your hands thoroughly.

continues on next page

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Stool Specimen

Level III

Purpose

The purpose of this procedure is to collect a stool specimen for laboratory testing.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Bedpan (with cover);
2. Stool specimen container (with cover);
3. Label;
4. Pen or pencil;
5. Wooden tongue depressor;
6. Paper towels;
7. Toilet tissue; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash your hands thoroughly before beginning the procedure.
2. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
3. If the resident cannot move his or her bowels for the stool specimen, instruct him or her to signal the nurses' station when he or she can.
4. Instruct the resident to defecate into the bedpan. (**Note:** Instruct the resident not to urinate or place toilet tissue into the bedpan. Instruct the resident to put used toilet tissue into the trash receptacle.)
5. Prepare the label for the specimen container. Record the resident's name, room number, and the date and time the specimen was collected.
6. Put on disposable gloves.
7. Once the resident has had a bowel movement, remove the bedpan and cover it.
8. Take the bedpan to the resident's bathroom.
9. Using the wooden tongue depressor, remove 1-2 tablespoons of feces from the bedpan and place it into the specimen container.
10. Place the label on the container. Cover the container immediately. (**Note:** Avoid touching the inside of the specimen container and cover.)
11. Wrap the wooden tongue depressor in a paper towel. Discard the tongue depressor into the same trash receptacle as the used toilet tissue.
12. Empty the remaining feces into the commode. Flush the commode.

continues on next page

13. Cleanse and rinse the bedpan. Store in assigned area.
14. Allow the resident to wash his or her hands.
15. Remove gloves. Discard into the designated container. Wash and dry your hands thoroughly.
16. Reposition the bed covers. Make the resident comfortable.
17. Place the call light within easy reach of the resident.
18. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
19. Send the specimen to the lab for testing as ordered.
20. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the specimen was collected.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Delirium – Clinical Protocol

Assessment and Recognition

1. As part of the initial and subsequent assessments, the physician and staff will identify individuals who have or recently had delirium, psychosis, or other significant acute change from baseline cognition and mental function.
2. Many individuals with a recent hospitalization still have delirium for some time after discharge. Delirium may be especially problematic in individuals with underlying dementia.
3. Prominent symptoms may include reduction in alertness, appetite, attention span, function, and responsiveness; alternating agitation and lethargy, fluctuation in level of consciousness, hallucinations, and delusions.
4. The staff and physician will identify individuals who are at increased risk for delirium and institute appropriate preventive measures; for example, a quiet, supportive environment; reduction of existing medications with anticholinergic properties or CNS side effects; maintenance of adequate food and fluid intake; monitoring for fluid and electrolyte imbalance; and so on.
5. Delirium can often be prevented and primary prevention is the preferred treatment strategy, rather than trying to affect the course of delirium after its onset.
6. The staff will define the nature (onset, frequency, and other exact details), severity, and extent of problematic behavior or related symptoms.
7. The physician will help clarify the situation; for example, distinguish delirium (an acute confusional state) from psychosis or agitated behavior related to dementia, etc.

Cause Identification

1. The physician will help identify causes and contributing factors related to delirium and acute changes in function and behavior, or document doing so is not indicated.
2. A systematic approach to evaluating individuals with delirium should be used, including consideration of common causes such as adverse medication consequences, fluid and electrolyte imbalance, and infections.
3. Many medications and medication combinations (for example, those with anticholinergic properties or side effects and others that affect the central nervous system) can cause or complicate delirium. In conjunction with the consultant pharmacist, the practitioner and staff should carefully review the existing medication regimen for medications or medication combinations that may be associated with delirium, altered level of consciousness, impaired cognition, or acute or intermittent confusion.

Treatment/Management

1. The physician will help identify appropriate treatments; for example, stop medications that may be affecting mental status and behavior, correct fluid and electrolyte imbalance, treat infection, correct hypothyroidism, etc.
2. The physician and staff will provide supportive care for a resident with delirium; for example, supplemental food and fluids, additional help with activities of daily living, and injury prevention measures.

continues on next page

Monitoring and Follow-Up

1. The physician will help review the progress of individuals with delirium and other acute or subacute altered mental status until stable.
2. This should include a review of whether appropriate preventive and supportive measures have been implemented and the impact of any changes to the medication regimen.
3. The physician may obtain appropriate consultative support, as indicated, for complex residents, those with recurrent symptoms, or those who do not improve or stabilize readily.
4. If a consultant is called to help manage acute confusional states or related behavioral issues, the attending physician will retain an active role by reviewing the consultant’s recommendations, addressing related medical issues, monitoring for complications related to treatment, and evaluating subsequent progress. The physician should not simply defer to the consultant for everything related to delirium.

Dementia – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals who have been diagnosed as having dementia and those with otherwise impaired cognition.
2. The IDT will evaluate individuals with new or progressive cognitive impairment and help identify symptoms and findings that differentiate dementia from other causes.
 - a. Dementia will be differentiated from delirium to the extent possible in residents presenting with impaired cognition. Delirium may be especially problematic in individuals with underlying dementia.
 - b. Prominent symptoms of delirium may include reduction in alertness, appetite, attention span, function, and responsiveness; confusion, alternating agitation and lethargy, fluctuation in level of consciousness, hallucinations, and delusions.
3. The physician will identify individuals taking cholinesterase inhibitors or other medications used to try to stabilize cognitive function, or medications such as antipsychotic medications and mood stabilizers that are commonly ordered to try to manage problematic behavior and disturbed mood.
4. The staff and physician will evaluate individuals with new or worsening cognitive impairment and behavior and differentiate dementia from other causes (see policy on Delirium/Altered Mental States).
5. The staff and physician will review the current physical, functional, and psychosocial status of individuals with dementia, and will summarize the individual's condition, related complications, and functional abilities and impairments.
6. The staff and physician will collaborate to stage dementia and identify prognosis.
7. The staff and physician will collaborate to define the decision-making capacity of someone with dementia, including the extent to which the individual can participate in making everyday decisions and in considering healthcare treatment options including life-sustaining treatments.
8. The staff and physician will collaborate to stage dementia and identify prognosis.

Cause Identification

1. The physician and staff will identify to the extent possible the neurological basis of the resident's dementia or cognitive loss, including:
 - a. Mental retardation/developmental disability;
 - b. Alzheimer's disease;
 - c. Parkinson's disease;
 - d. Traumatic brain injury;
 - e. Brain tumor; and/or
 - f. Normal pressure hydrocephalus.
2. As needed (for example, when the diagnosis is unclear, a basis for the diagnosis cannot be readily identified, or the individual's cognitive function is borderline normal or better), the physician will help verify or reconsider the diagnosis of dementia and identify other possible causes and coexisting psychiatric conditions.

continues on next page

- a. Individuals with dementia can also have a personality disorder, mental illness, psychosis, delirium, depression, adverse drug reactions (ADRs), or other conditions causing or contributing to impaired cognition and problematic behavior.
- b. As needed, the physician may obtain a psychiatrist or neurologist consultation to assist with diagnosis, treatment selection, monitoring of responses to treatment, and adjustment of medications.
3. As needed, the physician will document the basis for conclusions about the category and causes of a resident's dementia or impaired cognition; for example, multi-infarct disease, Alzheimer's disease, Lewy Body Disease, etc.
4. The physician will order any diagnostic tests indicated to clarify the nature or causes of dementia and identify other co-existing or alternative causes of cognitive impairment and problematic behavior; for example:
 - a. Thyroid dysfunction;
 - b. Adverse drug reactions;
 - c. Hypoxia;
 - d. Liver or renal failure;
 - e. Electrolyte imbalance;
 - f. Malnutrition;
 - g. Constipation; and/or
 - h. Diabetes.
5. The staff and physician will determine any relationship between the resident's level of pain and cognitive loss.

Treatment/Management

1. For the individual with confirmed dementia, the IDT will identify a resident-centered care plan to maximize remaining function and quality of life.
2. Nursing assistants will receive initial training in the care of residents with dementia and related behaviors. In-services will be conducted at least annually thereafter. Additionally, performance reviews will be conducted annually and in-service education will be based on the results of the reviews.
3. The facility will strive to optimize familiarity through consistent staff-resident assignments.
4. Direct care staff will support the resident in initiating and completing activities and tasks of daily living.
 - a. Bathing dressing, mealtimes, and therapeutic and recreational activities will be supervised and supported throughout the day as needed.
5. The IDT will identify and document the resident's condition and level of support needed during care planning and review changing needs as they arise.
 - a. Resident needs will be communicated to direct care staff through care plan conferences, during change of shift communications and through written documentation (nurses' notes and documentation tools).
 - b. Progressive or persistent worsening of symptoms and increased need of staff support will be reported to the IDT.
6. The physician will help define potential benefits and risks of medical interventions (including cholinesterase inhibitors and other medications used to enhance or stabilize cognition) based on individual risk factors, current conditions, history and details of current symptoms.

continues on next page

7. The physician and staff will identify and address with the resident and family ethical issues and any related life-sustaining treatment issues; for example, options for life-sustaining treatments in case of acute change in condition or anorexia and unplanned weight loss.
8. The physician will order appropriate interventions to address significant behavioral and psychiatric symptoms, based on pertinent clinical guidelines and consistent with regulatory requirements.
 - a. Medications will be targeted to specific symptoms and will be used in the lowest possible doses for the shortest possible time, unless a clinical rationale for higher doses or longer-term use is documented.
9. If a psychiatric consultant is called to help manage behavioral or psychiatric symptoms in the individual with dementia, the IDT will retain an active role by reviewing and implementing the consultant's recommendations, addressing issues that affect mood, cognition, and function, monitoring for complications related to treatment, and evaluating progress.

Monitoring and Follow-Up

1. The staff will monitor the individual with dementia for changes in condition and decline in function and will report these findings to the physician.
2. The IDT will adjust interventions and the overall plan depending on the individual's responses to those interventions, progression of dementia, development of new acute medical conditions or complications, changes in resident or family wishes, and other relevant factors.
3. The physician and staff will review the effectiveness and complications of medications used to try to enhance cognition and manage behavioral and psychiatric symptoms and will adjust, stop, or change such medications as indicated.

Depression – Clinical Protocol

Assessment and Recognition

1. The physician and staff will review available information and inquire further to identify and document individuals who have a history of depression or another mood disorder, other psychiatric disorder(s), psychiatric treatment or hospitalizations, or suicide attempts.
 - a. The staff and physician will document in the admission medical record the presence of these conditions or events in the resident's history.
2. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Description of affect, level of activity and responsiveness;
 - c. Whether mood decline is associated with anorexia, crying, sleeplessness;
 - d. Pain assessment;
 - e. Suicidal ideation (If present, follow facility policy/protocol for suicide threats);
 - f. Resident's age and sex;
 - g. Onset, duration, frequency, severity of signs and symptoms;
 - h. All current medications, especially those known to be associated with depression;
 - i. All active diagnoses;
 - j. Recent or current medical, psychological or social episodes related to condition; and
 - k. Any previous psychiatric consults or treatments.
3. The staff will screen residents/patients for depression, using appropriate screening tools, on admission and subsequently, if suggested by changes in mood, function, or behavior.
4. Staff will evaluate residents/patients (especially, those with a high-risk history) for possible evidence of a mood disorder.
 - a. Signs and symptoms may include, among others, depressed mood most of the day, almost every day; diminished interest or pleasure in most activities, most of the time; thoughts of death or suicide; feelings of helplessness, worthlessness or hopelessness; psychomotor agitation or retardation not attributable to other causes; change in sleep patterns or appetite; or avoidance of social interactions.
 - b. Examples of risk factors for depression include alcohol or substance abuse, current use of a medication associated with a high risk of depression, hearing or vision impairment severe enough to affect function, history of attempted suicide, history of psychiatric hospitalization, a personal or family history of depression or mood disorder, a medical diagnosis associated with a high risk of depression, new admission or change in environment, and new stressful losses including loss of autonomy, privacy, function, a body part, or a family member or friend.

Cause Identification

1. The physician will evaluate underlying causes of mood disorder, including depression, and contributing factors; for example, based on coexisting medical conditions, availability of recent diagnostic data, and findings from assessments and consultations.

continues on next page

- a. Examples of conditions that may increase the likelihood of depression or that may cause depressive symptoms include neurodegenerative disorders (for example, Alzheimer's disease, Parkinson's disease, multiple sclerosis), substance abuse, cancer, chronic pain, and endocrine disorders (for example, thyroid disease).
 - b. The physician and staff will evaluate the current medication regimen to identify medications that could be causing or contributing to depression; for example, clonidine and beta blockers.
2. The physician will identify the need for additional testing and/or consultation (psychiatric, psychological, etc.) to help define the nature, severity, causes, and complications (for example, psychosis or suicide risk) of any mood disorder.
 - a. If a psychiatric consultant is called to help diagnose and manage depression, the attending physician will retain an active role by reviewing the consultant's recommendations, addressing medical issues that affect mood, helping monitor for complications related to treatment, and evaluating subsequent progress.
 - b. The physician should not simply defer to the consultant for everything related to depression or mood disorders.

Treatment/Management

1. The staff will provide pertinent individualized non-pharmacologic interventions for the individual with depression; for example, addressing related psychological, spiritual, and family issues.
2. The physician will address underlying causes and related comorbidities.
 - a. For example, if the resident/patient has been taking medications that are known to cause depression or another mood disorder, the physician will adjust or stop the medication, consider alternatives, or otherwise try to minimize the risk of those medications.
 - b. The physician (with consultative support as needed) will identify and order appropriate non-pharmacological and pharmacological interventions, based on the preceding assessments.
3. The staff and physician should also identify target symptoms and an approximate treatment timetable for any medications.
4. Medications are not routinely or uniformly effective in individuals with depression or other mood disorders. Their value in individuals with dementia is questionable. Their effectiveness may depend on the severity of depression (see *Boyce et al* and *Fournier et al* in references). The challenge is to identify a medication which helps improve symptoms and quality of life while minimizing side effects.

Monitoring and Follow-Up

1. The staff and physician will monitor the resident's response to treatment for a mood disorder and will document approaches, timetables, and goals of treatment in the interdisciplinary care plan and progress notes.
 - a. Examples of monitoring criteria include improvement or resolution of symptoms, improved quality of life and enjoyment of usual activities, and improved sleep.
2. The staff and physician will monitor the resident/patient carefully for side effects of any medications used to treat a mood disorder as well as interactions between antidepressants and other classes of medications.
 - a. For example, antidepressants may increase fall risk; also, excessive serotonin stimulation due to antidepressants and other medications can cause the "serotonin syndrome," which can result in symptoms such as increasing agitation, change in mental function, seizures, or death.

continues on next page

3. If antidepressant medications have been used, the physician will identify the possibility of tapering or stopping them, based on efficacy (i.e., whether there has been any clinically significant improvement), side effects, and pertinent protocols (for example, tapering after 6 months to 1 year of treatment for a first episode of uncomplicated depression).

Version	1.3 (H5MACL0014)

Antipsychotic Medication Use

Policy Statement

Antipsychotic medications may be considered for residents with dementia but only after medical, physical, functional, psychological, emotional psychiatric, social and environmental causes of behavioral symptoms have been identified and addressed.

Antipsychotic medications will be prescribed at the lowest possible dosage for the shortest period of time and are subject to gradual dose reduction and re-review.

Policy Interpretation and Implementation

1. Residents will only receive antipsychotic medications when necessary to treat specific conditions for which they are indicated and effective.
2. The attending physician and other staff will gather and document information to clarify a resident's behavior, mood, function, medical condition, specific symptoms, and risks to the resident and others.
3. The attending physician will identify, evaluate and document, with input from other disciplines and consultants as needed, symptoms that may warrant the use of antipsychotic medications.
4. The attending physician and facility staff will identify acute psychiatric episodes, and will differentiate them from enduring psychiatric conditions.
5. Residents who are admitted from the community or transferred from a hospital and who are already receiving antipsychotic medications will be evaluated for the appropriateness and indications for use. The interdisciplinary team will:
 - a. complete PASRR screening (preadmission screening for mentally ill and intellectually disabled individuals), if appropriate; or
 - b. re-evaluate the use of the antipsychotic medication at the time of admission and/or within two weeks (at the initial MDS assessment) to consider whether or not the medication can be reduced, tapered, or discontinued.
 - c. based on assessing the resident's symptoms and overall situation, the physician will determine whether to continue, adjust, or stop existing antipsychotic medication.
6. Diagnosis of a specific condition for which antipsychotic medications are necessary to treat will be based on a comprehensive assessment of the resident.
7. Antipsychotic medications shall generally be used only for the following conditions/diagnoses as documented in the record, consistent with the definition(s) in the Diagnostic and Statistical Manual of Mental Disorders (current or subsequent editions):
 - a. Schizophrenia;
 - b. Schizoaffective disorder;
 - c. Schizophreniform disorder;
 - d. Delusional disorder;
 - e. Mood disorders (e.g. bipolar disorder, depression with psychotic features, and treatment refractory major depression);
 - f. Psychosis in the absence of dementia;

continues on next page

- g. Medical illnesses with psychotic symptoms and/or treatment-related psychosis or mania (e.g., high-dose steroids);
 - h. Tourette's Disorder;
 - i. Huntington Disease;
 - j. Hiccups (not induced by other medications); or
 - k. Nausea and vomiting associated with cancer or chemotherapy.
8. Diagnoses alone do not warrant the use of antipsychotic medication. In addition to the above criteria, antipsychotic medications will generally only be considered if the following conditions are also met:
- a. The behavioral symptoms present a danger to the resident or others; AND:
 - (1) the symptoms are identified as being due to mania or psychosis (such as auditory, visual, or other hallucinations; delusions, paranoia or grandiosity); or
 - (2) behavioral interventions have been attempted and included in the plan of care, except in an emergency (see below).
9. In the case of an emergency situation (that is, an acute onset or exacerbation of symptoms or immediate threat to the health or safety of a resident or others) related to one or more of the above conditions or diagnoses, the use of antipsychotic medications must meet following additional requirements:
- a. The acute treatment period is limited to seven days or less; and
 - b. A clinician in conjunction with the interdisciplinary team must evaluate and document the situation within 7 days, to identify and address any contributing and underlying causes of the acute psychiatric condition and verify the continuing need for antipsychotic medication; and
 - c. Pertinent non-pharmacological interventions must be attempted, unless contraindicated, and documented following the resolution of the acute psychiatric situation.
10. For enduring psychiatric conditions, antipsychotic medications will not be used unless behavioral symptoms are:
- a. not due to a medical condition or problem (e.g., headache or joint pain, fluid or electrolyte imbalance, pneumonia, hypoxia, unrecognized hearing or visual impairment, medication side effect, or polypharmacy) that can be expected to improve or resolve as the underlying condition is treated or the offending medication(s) are discontinued; and
 - b. persistent or likely to reoccur without continued treatment; and
 - c. not sufficiently relieved by non-pharmacological interventions; and
 - d. not due to environmental stressors (e.g., alteration in the resident's customary location or daily routine, unfamiliar care provider, hunger or thirst, excessive noise for that individual, inadequate or inappropriate staff response, physical barriers) that can be addressed to improve the psychotic symptoms or maintain safety; and
 - e. not due to psychological stressors (e.g., loneliness, taunting, abuse), or anxiety or fear stemming from misunderstanding related to his or her cognitive impairment (e.g., the mistaken belief that this is not where he/she lives or inability to find his or her clothes or glasses) that can be expected to improve or resolve as the situation is addressed.
11. Antipsychotic medications will not be used if the only symptoms are one or more of the following:
- a. Wandering;
 - b. Poor self-care;
 - c. Restlessness;
 - d. Impaired memory;
 - e. Mild anxiety;
 - f. Insomnia;

continues on next page

- g. Inattention or indifference to surroundings;
 - h. Sadness or crying alone that is not related to depression or other psychiatric disorders;
 - i. Fidgeting;
 - j. Nervousness; or
 - k. Uncooperativeness.
12. All antipsychotic medications will be used within the dosage guidelines listed in F757, or clinical justification will be documented for dosages that exceed the listed guidelines for more than 48 hours.
 13. Residents will not receive PRN doses of psychotropic medications unless that medication is necessary to treat a specific condition that is documented in the clinical record.
 14. The need to continue PRN orders for psychotropic medications beyond 14 days requires that the practitioner document the rationale for the extended order. The duration of the PRN order will be indicated in the order.
 15. PRN orders for antipsychotic medications will not be renewed beyond 14 days unless the healthcare practitioner has evaluated the resident for the appropriateness of that medication.
 16. The staff will observe, document, and report to the attending physician information regarding the effectiveness of any interventions, including antipsychotic medications.
 17. Nursing staff shall monitor for and report any of the following side effects and adverse consequences of antipsychotic medications to the attending physician:
 - a. General/anticholinergic: constipation, blurred vision, dry mouth, urinary retention, sedation;
 - b. Cardiovascular: orthostatic hypotension, arrhythmias;
 - c. Metabolic: increase in total cholesterol/triglycerides, unstable or poorly controlled blood sugar, weight gain; or
 - d. Neurologic: Akathisia, dystonia, extrapyramidal effects, akinesia; or tardive dyskinesia, stroke or TIA.
 18. The physician shall respond appropriately by changing or stopping problematic doses or medications, or clearly documenting (based on assessing the situation) why the benefits of the medication outweigh the risks or suspected or confirmed adverse consequences.

Behavioral Assessment, Intervention and Monitoring

Policy Statement

1. The facility will provide and residents will receive behavioral health services as needed to attain or maintain the highest practicable physical, mental and psychosocial well-being in accordance with the comprehensive assessment and plan of care.
2. Behavioral symptoms will be identified using facility-approved behavioral screening tools and the comprehensive assessment.
3. Residents who do not display symptoms of, or have not been diagnosed with, mental, psychiatric, psychosocial adjustment, substance abuse or post-traumatic stress disorder(s) will not develop behavioral disturbances that cannot be attributed to a specific clinical condition that makes the pattern unavoidable.
4. Behavioral health services will be provided by qualified staff who have the competencies and skills necessary to provide appropriate services to the residents.
5. Residents will have minimal complications associated with the management of altered or impaired behavior.
6. The facility will comply with regulatory requirements related to the use of medications to manage behavioral changes.

Policy Interpretation and Implementation

General Guidelines

1. “Behavior” is the response of an individual to a wide variety of factors. These factors may include medical, physical, functional, psychosocial, emotional, psychiatric, or environmental causes.
 - a. Behavior is regulated by the brain and is influenced by past experiences, personality traits, environment, and interactions with other people.
 - b. Behavior can be a way for an individual in distress to communicate unmet needs, indicate discomfort, or express thoughts that cannot be articulated.
2. “Behavioral or Psychological Symptoms of Dementia (BPSD)” describes behavioral symptoms in individuals with dementia that cannot be attributed to a specific medical or psychiatric cause.
 - a. Appropriate assessment and treatment of behavioral symptoms requires differentiating between behavioral symptoms that can be managed by treating underlying factors, and those that cannot.
3. Current guidelines recommend the use of non-pharmacological interventions for BPSD.

Assessment

1. As part of the initial assessment, the nursing staff and attending physician will identify individuals with a history of impaired cognition, altered behavior, substance use disorder, or mental disorder.
 - a. All residents will receive a Level I PASARR screen prior to admission.
 - b. If the level I screen indicates that the individual may meet the criteria for a mental disorder, intellectual disability or related condition he or she will be referred to the state PASARR representative for the Level II (evaluation and determination) screening process.

continues on next page

- c. The Level II evaluation report will be used when conducting the resident assessment and developing the care plan.
2. As part of the comprehensive assessment, staff will evaluate, based on input from the resident, family and caregivers, review of medical record and general observations:
 - a. the resident's usual patterns of cognition, mood and behavior;
 - b. the resident's usual method of communicating things like pain, hunger, thirst, and other physical discomforts;
 - c. the resident's typical or past responses to stress, fatigue, fear, anxiety, frustration and other triggers; and
 - d. the resident's previous patterns of coping with stress, anxiety, and depression.
3. The nursing staff will identify, document, and inform the physician about specific details regarding changes in an individual's mental status, behavior, and cognition, including:
 - a. onset, duration, intensity and frequency of behavioral symptoms;
 - b. any recent precipitating or relevant factors or environmental triggers (e.g., medication changes, infection, recent transfer from hospital); and
 - c. appearance and alertness of the resident and related observations.
4. New onset or changes in behavior will be documented regardless of the degree of risk to the resident or others.
5. New onset or changes in behavior that indicate newly evident or possible serious mental disorder, intellectual disability, or a related disorder will be referred for a PASARR Level II evaluation.
6. Current Level II residents will be referred for an additional PASARR Level II evaluation upon a significant change in status assessment.

Cause Identification

1. The interdisciplinary team will *thoroughly evaluate* new or changing behavioral symptoms in order to identify underlying causes and address any modifiable factors that may have contributed to the resident's change in condition, including:
 - a. physical or medical changes (for example):
 - (1) infection;
 - (2) dehydration;
 - (3) pain or discomfort;
 - (4) constipation;
 - (5) change related to medications; and/or
 - (6) worsening of or complications related to other conditions.
 - b. emotional, psychiatric and/or psychological stressors (for example):
 - (1) depression;
 - (2) boredom;
 - (3) loneliness;
 - (4) anxiety; and/or
 - (5) fear.

continues on next page

- c. functional, social or environmental factors (for example):
 - (1) alteration in routine;
 - (2) change in caregivers;
 - (3) sleep disturbances;
 - (4) decline in ability to perform self-care or tasks that he or she could previously complete without help;
 - (5) poor or excessive lighting;
 - (6) noise; and/or
 - (7) uncomfortable temperatures.

Management

1. The interdisciplinary team will evaluate behavioral symptoms in residents to determine the degree of severity, distress and potential safety risk to the resident, and develop a plan of care accordingly. Safety strategies will be implemented immediately if necessary to protect the resident and others from harm.
 - a. Atypical behavior will be differentiated from behavior that is dangerous or problematic for the resident(s) or staff, or behavior that signals underlying distress.
 - b. If the behavior is atypical but not problematic or dangerous and the resident does not appear to be in distress, then the IDT will monitor for changes but not necessarily intervene to “normalize” the behavior.
2. The care plan will incorporate findings from the comprehensive assessment and PASARR Level II determinations (as appropriate), and be consistent with current standards of practice.
3. The resident and family or representative will be involved in the development and implementation of the care plan. Resident and family involvement, or attempts to include the resident and family in care planning and treatment, will be documented.
4. The resident and family/representatives will be informed of the resident’s condition as well as the potential risks and benefits or proposed interventions.
5. The resident and/or resident surrogate will have the right to refuse treatment.
6. If the resident lacks decision-making capacity and does not have effective family support, the IDT will contact social services to provide assistance to the resident.
7. Interventions will be individualized and part of an overall care environment that supports physical, functional and psychosocial needs, and strives to understand, prevent or relieve the resident’s distress or loss of abilities.
8. Interventions and approaches will be based on a detailed assessment of physical, psychological and behavioral symptoms and their underlying causes, as well as the potential situational and environmental reasons for the behavior. The care plan will include, as a minimum:
 - a. a description of the behavioral symptoms, including:
 - (1) frequency;
 - (2) intensity;
 - (3) duration;
 - (4) outcomes;
 - (5) location;
 - (6) environment; and
 - (7) precipitating factors or situations.

continues on next page

- b. targeted and individualized interventions for the behavioral and/or psychosocial symptoms;
 - c. the rationale for the interventions and approaches;
 - d. specific and measurable goals for targeted behaviors; and
 - e. how the staff will monitor for effectiveness of the interventions.
9. Non-pharmacologic approaches will be utilized to the extent possible to avoid or reduce the use of antipsychotic medications to manage behavioral symptoms.
10. When medications are prescribed for behavioral symptoms, documentation will include:
- a. rationale for use;
 - b. potential underlying causes of the behavior;
 - c. other approaches and interventions tried prior to the use of antipsychotic medications;
 - d. potential risks and benefits of medications as discussed with the resident and/or family;
 - e. specific target behaviors and expected outcomes;
 - f. dosage;
 - g. duration;
 - h. monitoring for efficacy and adverse consequences; and
 - i. plans (if applicable) for gradual dose reduction.
11. The director of nursing, or designee, will evaluate whether the staffing needs have changed based on acuity of the residents and their plans of care. Additional staff and/or staff training will be provided if it determined that the needs of the residents cannot be met with the current level of staff or staff training

Monitoring

1. If the resident is being treated for altered behavior or mood, the IDT will seek and document any improvements or worsening in the individual's behavior, mood, and function.
2. The IDT will monitor the progress of individuals with impaired cognition and behavior until stable. New or emergent symptoms will be documented and reported.
3. Interventions will be adjusted based on the impact on behavior and other symptoms, including any adverse consequences related to treatment.
4. If antipsychotic medications are used to treat behavioral symptoms, the IDT will monitor their indication and implement a gradual dose reduction, or document why this cannot or should not be done (for example, recurrence of psychotic symptoms after several previous attempts to taper medications).
 - a. The IDT will monitor for side effects and complications related to psychoactive medications; for example, lethargy, abnormal involuntary movements, anorexia, or recurrent falling.
 - b. If such symptoms are identified, and some medication is still needed, the IDT will adjust the current regimen to try to minimize side effects while maintaining therapeutic effectiveness.
5. If any devices (restraints) are prescribed, the IDT will monitor the situation to ensure that they are beneficial to the individual (for example, enhancing function and improving symptoms) and are not causing complications or disabling the individual.
 - a. This will be done frequently when such devices are first employed and regularly thereafter for as long as they are used.
 - b. Over time, the staff will reduce the use or remove such devices, or will document why such attempts are not feasible.

Behavioral Health Services

Policy Statement

1. The facility will provide and residents will receive behavioral health services as needed to attain or maintain the highest practicable physical, mental and psychosocial well-being in accordance with the comprehensive assessment and plan of care.

Policy Interpretation and Implementation

1. Behavioral health services are provided to residents as needed as part of the interdisciplinary, person-centered approach to care.
2. Residents who exhibit signs of emotional/psychosocial distress receive services and support that address their individual needs and goals for care.
3. Residents who do not display symptoms of, or have not been diagnosed with, mental, psychiatric, psychosocial adjustment, substance abuse or post-traumatic stress disorder(s) will not develop behavioral disturbances that cannot be attributed to a specific clinical condition that makes the pattern unavoidable.
4. Staff must promote dignity, autonomy, privacy, socialization and safety as appropriate for each resident and are trained in ways to support residents in distress.
5. Staff training regarding behavioral health services includes, but is not limited to:
 - a. recognizing changes in behavior that indicate psychological distress;
 - b. implementing care plan interventions that are relevant to the resident’s diagnosis and appropriate to his or her needs;
 - c. monitoring care plan interventions and reporting changes in condition; and
 - d. protocols and guidelines related to the treatment of mental disorders, psychosocial adjustment difficulties, history of trauma and post-traumatic stress disorder.
6. Behavioral health services are provided by staff who are qualified and competent in behavioral health and trauma-informed care.
7. Staff are scheduled in sufficient numbers to manage resident needs throughout the day, evening and night.

Unmanageable Residents

Policy Statement

Each resident will be provided with a safe place of residence.

Policy Interpretation and Implementation

1. Should a resident's behavior become abusive, hostile, assaultive, or unmanageable in any way that would jeopardize his or her safety or the safety of others, the nurse supervisor/charge nurse must immediately:
 - a. provide for the safety of all concerned (i.e., move resident, equipment, etc.);
 - b. notify the resident's attending physician for instructions;
 - c. notify the director of nursing services; and
 - d. notify the resident's representative (sponsor).
2. The director of nursing services has the authority to order emergency restraint use in accordance with our facility's established restraint policy.
3. Should the resident pose an immediate danger, or become violent or beyond the control of the facility, local law enforcement agencies may be called for assistance.
4. Every effort shall be made to calm the resident. However, personal safety must always be considered.
5. Unmanageable residents may not be retained by the facility. Discharge proceedings will be implemented as instructed by the attending physician or medical director in accordance with current laws and regulations governing such discharges.
6. Should a resident's behavior become uncontrollable, the nurse supervisor/charge nurse shall have the authority to contact the resident's representative (sponsor) and require that a member of the family remain with the resident until the resident calms down or is transferred.
7. Complete documentation of the incident must be recorded in the resident's medical record and an incident report must be filed with the administrator.

Related Documents	Use of Restraints
Version	1.0 (H5MAPL0912)

Use of Restraints

Policy Statement

Restraints shall only be used for the safety and well-being of the resident(s) and only after other alternatives have been tried unsuccessfully.

Restraints shall only be used to treat the resident's medical symptom(s) and never for discipline or staff convenience, or for the prevention of falls.

When the use of restraints is indicated, the least restrictive alternative will be used for the least amount of time necessary, and the ongoing re-evaluation for the need for restraints will be documented.

Policy Interpretation and Implementation

1. "Physical Restraints" are defined as any manual method or physical or mechanical device, material or equipment attached or adjacent to the resident's body that the individual cannot remove easily, which restricts freedom of movement or restricts normal access to one's body.
2. The definition of a restraint is based on the functional status of the resident and not the device. If the resident cannot remove a device in the same manner in which the staff applied it given that resident's physical condition (i.e., side rails are put back down, rather than climbed over), and this restricts his/her typical ability to change position or place, that device is considered a restraint.
3. Examples of devices that are/may be considered physical restraints include leg restraints, arm restraints, hand mitts, soft ties or vest, wheelchair safety bars, geri-chairs, and lap cushions and trays that the resident cannot remove.
4. Practices that inappropriately utilize equipment to prevent resident mobility are considered restraints and are not permitted, including:
 - a. using bedrails to keep a resident from voluntarily getting out of bed as opposed to enhancing mobility while in bed;
 - b. tucking sheets so tightly that a bed-bound resident cannot move;
 - c. placing a resident in a chair that prevents the resident from rising; and
 - d. placing a resident who uses a wheelchair so close to the wall that the wall prevents the resident from rising.
5. Restraints may only be used if/when the resident has a specific medical symptom that cannot be addressed by another less restrictive intervention AND a restraint is required to:
 - a. treat the medical symptom;
 - b. protect the resident's safety; and
 - c. help the resident attain the highest level of his/her physical or psychological well-being.
6. Prior to placing a resident in restraints, there shall be a pre-restraining assessment and review to determine the need for restraints. The assessment shall be used to determine possible underlying causes of the problematic medical symptom and to determine if there are less restrictive interventions (programs, devices, referrals, etc.) that may improve the symptoms.

continues on next page

7. Emergency use of restraints is permitted if their use is immediately necessary to prevent the resident from injuring himself/herself or others and/or to prevent the resident from interfering with life-sustaining treatment, and no other less-restrictive interventions are feasible.
 - a. The director of nursing services has the authority to order the use of emergency restraints. The attending physician must be notified of such use and the reason for the order.
 - b. Orders for emergency restraints may be received by telephone, and shall be signed by the physician within forty eight (48) hours.
 - c. The emergency use of restraints must not extend beyond the immediate episode.
8. Treatment restraints may be used for the protection of the resident during treatment and diagnostic procedures **if the resident and/or representative has consented to the treatment or procedure and the use of treatment restraints**. Treatment restraints shall be applied for no longer than the time required to complete the treatment.
9. Restraints shall only be used upon the written order of a physician and after obtaining consent from the resident and/or representative (sponsor). The order shall include the following:
 - a. The specific reason for the restraint (as it relates to the resident's medical symptom);
 - b. How the restraint will be used to benefit the resident's medical symptom; and
 - c. The type of restraint, and period of time for the use of the restraint.
10. Orders for restraints will not be enforced for longer than twelve (12) hours, unless the resident's condition requires continued treatment.
11. Reorders are issued **only** after a review of the resident's condition by his or her physician.
12. The following safety guidelines shall be implemented and documented while a resident is in restraints:
 - a. Restraints shall be used in such a way as not to cause physical injury to the resident and to insure the least possible discomfort to the resident.
 - b. Physical restraints shall be applied in such a manner that they can be speedily removed in case of fire or other emergency. Restraints with locking devices shall **not** be used.
 - c. A resident placed in a restraint will be observed at least every thirty (30) minutes by nursing personnel and an account of the resident's condition shall be recorded in the resident's medical record.
 - d. The opportunity for motion and exercise is provided for a period of not less than ten (10) minutes during each two (2) hours in which restraints are employed.
 - e. Restrained residents must be repositioned at least every two (2) hours on all shifts.
13. Seclusion, which is defined as the placement of a resident alone in a room, shall not be employed.
14. Residents and/or surrogate/sponsor shall be informed about the potential risks and benefits of all options under consideration, including the use of restraints, not using restraints, and the alternatives to restraint use.
15. Should a resident not be capable of making a decision, the surrogate or sponsor may exercise the right of the use or non-use of a restraint. (Note: The surrogate/sponsor may not give permission to use restraints for the sake of discipline or staff convenience or when the restraint is not necessary to treat the resident's medical symptoms.)
16. Restrained individuals shall be reviewed regularly (at least quarterly) to determine whether they are candidates for restraint reduction, less restrictive methods of restraints, or total restraint elimination.
17. Care plans for residents in restraints will reflect interventions that address not only the immediate medical symptom(s), but the underlying problems that may be causing the symptom(s).

continues on next page

18. Care plans shall also include the measures taken to systematically reduce or eliminate the need for restraint use.
19. Documentation regarding the use of restraints shall include:
 - a. full documentation of the episode leading to the use of the physical restraint. This includes not only the resident symptoms but also the conditions, circumstances, and environment associated with the episode
 - b. a description of the resident’s medical symptoms (i.e., an indication or a characteristic of a physical or psychological condition) that warranted the use of restraints;
 - c. how the restraint use benefits the resident by addressing the medical symptom;
 - d. the type of the physical restraint used;
 - e. the length of effectiveness of the restraint time; and
 - f. observation, range of motion and repositioning flow sheets.

Wandering and Elopements

Policy Statement

The facility will identify residents who are at risk of unsafe wandering and strive to prevent harm while maintaining the least restrictive environment for residents.

Policy Interpretation and Implementation

1. If identified as at risk for wandering, elopement, or other safety issues, the resident's care plan will include strategies and interventions to maintain the resident's safety.
2. If an employee observes a resident leaving the premises, he/she should:
 - a. attempt to prevent the resident from leaving in a courteous manner;
 - b. get help from other staff members in the immediate vicinity, if necessary; and
 - c. instruct another staff member to inform the charge nurse or director of nursing services that a resident is attempting to leave or has left the premises.
3. If a resident is missing, initiate the elopement/missing resident emergency procedure:
 - a. Determine if the resident is out on an authorized leave or pass;
 - b. If the resident was not authorized to leave, initiate a search of the building(s) and premises; and
 - c. If the resident is not located, notify the administrator and the director of nursing services, the resident's legal representative, the attending physician, law enforcement officials, and (as necessary) volunteer agencies (i.e., emergency management, rescue squads, etc.).
4. When the resident returns to the facility, the director of nursing services or charge nurse shall:
 - a. examine the resident for injuries;
 - b. contact the attending physician and report findings and conditions of the resident;
 - c. notify the resident's legal representative (sponsor);
 - d. notify search teams that the resident has been located;
 - e. complete and file an incident report; and
 - f. document relevant information in the resident's medical record.

Neurological Assessment

Level III

Purpose

The purpose of this procedure is to provide guidelines for a neurological assessment: 1) upon physician order; 2) when following an unwitnessed fall; 3) subsequent to a fall with a suspected head injury; or 4) when indicated by resident condition.

General Guidelines

1. Neurological assessments are indicated:
 - a. Upon physician order;
 - b. Following an unwitnessed fall;
 - c. Following a fall or other accident/injury involving head trauma; or
 - d. When indicated by resident's condition.
2. When assessing neurological status, always include frequent vital signs. Particular attention should be paid to widening pulse pressure (difference between systolic and diastolic pressures). This may be indicative of increasing intracranial pressure (ICP).
3. Any change in vital signs or /neurological status in a previously stable resident should be reported to the physician immediately.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Flashlight;
2. Stethoscope and sphygmomanometer;
3. Thermometer;
4. Watch with second hand; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
3. Perform neurological checks with the frequency as ordered or per falls protocol.
4. Determine resident's orientation to time, place and person.
5. Observe resident's patterns of speech and speech clarity.
6. Take temperature, pulse, respirations, blood pressure.
 - a. Use oral thermometer only if safe with this type of resident.
 - b. Respirations are increased and shallow with ICP.
 - c. Pulse usually increases with ICP.
 - d. Blood pressure usually increases with widening pulse pressure with ICP.
7. Check pupil reaction:
 - a. Darken room.
 - b. Open eyelid with your fingers.

continues on next page

- c. Turn on flashlight and observe size and reaction of pupil.
- d. Repeat for the other eye.
8. Determine motor ability:
 - a. Have resident move all extremities.
 - b. Ask resident to squeeze your fingers. Note strength bilaterally.
 - c. Have resident plantar and dorsiflex. Note strength bilaterally. Ask resident if he/she has any numbness or tingling in legs/feet/toes and document accordingly.
9. Determine sensation in extremities. Rub resident's arms at the same time to see if resident has decreased sensation in either arm. Check sensation in lower extremities also and document accordingly.
10. Check gag reflex with tongue depressor, if safe for resident.
11. Have the resident smile to determine if there is any facial drooping and document accordingly.
12. Check eye opening, verbal, and motor responses using the **Glasgow Coma Scale**. Record observations.
13. Reposition the bed covers. Make the resident comfortable. Use seizure precautions if indicated.
14. Place the call light within easy reach of the resident.
15. Clean reusable equipment according to the manufacturer's instructions.
16. Clean the bedside stand.
17. If the resident desires, return the door and curtains to an open position and if visitors are waiting, tell them they may now enter the room.
18. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the physician of any change in a resident's neurological status.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Physical Restraint Application

Level III

Purpose

The purpose of this procedure is to provide safety or postural support of a resident to prevent injury to the resident or others when the resident has medical symptoms that warrant the use of restraints.

Definition

Physical restraints are defined by the Centers for Medicare and Medicaid Services (CMS) as any manual method or physical or mechanical device, material, or equipment attached or adjacent to the resident's body that the individual cannot remove easily which restricts freedom of movement or normal access to one's body. (Note: The definition of restraints is based on the functional status of the resident and not on the device, therefore any device that has the effect on the resident of restricting freedom of movement or normal access to one's body could be considered a restraint. The resident must be physically and cognitively able to self-release devices such as velcro lap trays or tables, seat belts with velcro, or easy snap seat belts. If a resident cannot mentally and physically self-release, then the device is considered a restraint.)

Preparation

1. Verify physician's order for the use of restraints.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble equipment and supplies needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Restraint, as ordered;
2. Soap;
3. Water;
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed); and
5. Other equipment or supplies as necessary or appropriate.

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Apply the ordered restraint using the appropriate procedure. ***Follow the instructions provided by the manufacturer of the restraint.***
4. Method of application for **Cloth Vests**:
 - a. Apply vest over arms and shoulders. "V" is in the front.
 - b. Cross ties behind the resident to allow for movement.
 - c. Tie behind wheelchair and under the armrests or to moveable part of the bed frame with a slip knot to allow for speedy removal in an emergency.
 - d. Place one hand under edge of vest to be sure it is not too tight.
 - e. Never tie to or around the side rails or the lowest part of the bedframe.

continues on next page

5. Method of application for **Soft Tie Belt:**
 - a. Place soft tie belt across the resident's waist.
 - b. Cross tie behind the resident to allow for movement.
 - c. Tie behind wheelchair and under the armrests or to moveable part of the bed frame with a slip knot to allow for speedy removal in an emergency.
 - d. Place one hand under edge of soft tie belt to be sure it is not too tight.
 - e. Never tie to or around the side rails or the lowest part of the bedframe.
6. Method of application for **Soft Cloth Mittens:**
 - a. Place mitten on resident's hand.
 - b. Secure the mitten at the resident's wrist loose enough to insert two fingers between the mitten and the wrist.
 - c. If the wrist is to be restrained also, follow wrist restraint directions below.
7. Method of application for **Wrist Restraints:**
 - a. Place soft cloth cuff of the wrist restraint around the resident's wrist. Allow sufficient room to insert three fingers between the resident's wrist and the restraint.
 - b. Tie in such a manner that restraint will not tighten when pulled.
 - c. Secure tie to arm of the wheelchair or to moveable part of the bed frame allowing adequate length of tie for movement.
 - d. Never tie to or around the side rails or lowest part of the bed frame.
8. Method of application for **Seat Belt:**
 - a. Position the resident's arms and hands free from restriction by the seat belt.
 - b. Straighten the seat belt; no irritating twists or wrinkles should be present.
 - c. Position seat belt around resident's waist and secure clasp. Place one hand under edge of seat belt to be sure it is not too tight.
 - d. Check to be sure that clasp does not cause pressure to any part of the resident's body.
9. Method of application for **Trays:**
 - a. Position the resident's arms and hands free from restriction by the tray.
 - b. Place the tray in proper position on top of the wheelchair/chair arms.
 - c. Secure the tray with spring release clamps or velcro fasteners.
 - d. Position the resident's arms comfortably on top of the tray.
 - e. Place one hand between the resident and the tray to be sure tray is not causing pressure on any part of the resident's body.
10. Be gentle with the resident. Do not rush the procedure.
11. Secure all types of restraints in a slip knot to allow for speedy removal in an emergency.
12. Make the resident comfortable (e.g., reposition bed covers, position comfortably in wheelchair, etc.).
13. Place the call light within easy reach of the resident.
14. If used, clean the bedside stand and/or overbed table and return the overbed table to its proper position.
15. If the resident desires, return the door and curtains to an open position and if visitors are waiting, tell them they may now enter the room.
16. Check the resident every 30 minutes.
17. Remove the restraint every 2 hours for at least 10 minutes and change the resident's position. Exercise the resident.
18. Take the resident to the bathroom at regular intervals.
19. Wash and dry your hands thoroughly before and after care.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the restraint was applied.
2. The name and title of the individual(s) who applied the restraint.
3. The type of physical restraint applied.
4. The specific reason the restraint was applied.
5. The length of time the restraint will be used.
6. Each time the device is released for resident exercise, toileting, and position change.
7. Each time the resident is monitored, per facility policy.
8. All assessment data (e.g., bruises, rashes, sores, etc.) observed during the procedure.
9. If and how the resident participated in the procedure or any changes in the resident’s ability to participate in the procedure.
10. Any problems or complaints made by the resident related to the restraint application.
11. If the resident refused the treatment and the reason(s) why.
12. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Trauma Informed Care

Level III

Purpose

To guide staff in appropriate and compassionate care specific to individuals who have experienced trauma.

Preparation

1. All staff are provided in-service training about trauma, its impact on health, and post-traumatic stress disorder in the context of the healthcare setting.
2. Nursing staff are trained on screening tools, trauma assessment and how to identify triggers associated with re-traumatization.
3. All staff are guided in evidence-based organizational and interpersonal strategies that support trauma informed care.

General Guidelines

1. This facility supports a culture of emotional well-being and physical safety for staff, residents and visitors.
2. Trauma-informed care is culturally sensitive and person-centered.
3. Caregivers are taught strategies to help eliminate, mitigate or sensitively address a resident's triggers.

Steps in the Procedure

Organizational Strategies

1. Develop an organizational culture that supports trauma-informed care.
2. Use trauma-informed principles in strategic planning.
3. Include trauma-informed care as part of the QAPI plan, so that needs and problem areas are identified and addressed.
4. Evaluate trauma-informed practices as part of the facility assessment.
5. Develop relationships with community support organizations for services, referrals, training and information.
6. Implement universal screening of residents for trauma.
7. Establish an environment of physical safety; for example, well lit entrances and parking lots, security systems or personnel.
8. Provide staff members with opportunities to seek professional support and counseling to resolve their own experiences with trauma.
9. Promote organizational strategies to recognize and reduce caregiver burnout.

continues on next page

Resident-Care Strategies

1. As part of the comprehensive assessment, identify history of trauma or interpersonal violence when possible. Identifying past trauma or adverse experiences may involve record review or the use of screening tools.
2. Utilize trained and qualified staff members who have established a rapport with the resident to assess him or her for previous trauma.
3. Interact with all residents and visitors in a manner that is welcoming and kind, without being intrusive.
4. Reduce or eliminate unnecessary stimuli (noise, lighting, unwanted or sudden physical contact, etc.).

Sample Documentation

PT/INR/Coumadin (Warfarin) Flowsheet (MP5583)

Tools

AHA Pacemaker Identification – Wallet Card

Know Stroke (NIH Stroke Scale Booklet)

Anticoagulation – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician and staff will identify individuals who are currently anticoagulated; for example, those with a recent history of deep vein thrombosis (DVT), or heart valve replacement, atrial fibrillation or those who have had recent joint replacement surgery.
 - a. Assess for any signs or symptoms related to adverse drug reactions due to the medication alone or in combination with other medications.
 - b. Assess for evidence of effects related to the subtherapeutic or greater than therapeutic drug level related to that particular drug (for example, a resident with an above therapeutic level of an anticoagulation medication should be assessed for bleeding).
2. In addition, the nurse shall assess and document/report the following:
 - a. Current anticoagulation therapy, including drug and current dosage;
 - b. Recent labs, including therapeutic dose monitoring;
 - c. Other current medications; and
 - d. All active diagnoses.
3. The staff and physician will identify situations where an individual is not anticoagulated but where anticoagulation may be indicated; for example, new onset deep vein thrombosis (DVT), or new or previously unrecognized carotid artery stenosis or atrial fibrillation.

Cause Identification

1. The physician will seek or verify underlying causes of conditions requiring anticoagulation (for example, hyperthyroidism or atrial fibrillation related to mitral stenosis related to atrial fibrillation), and identify potentially reversible causes.

Treatment/Management

1. The physician will prescribe anticoagulation therapy (for example, low molecular weight heparin, warfarin, or other oral anticoagulant) appropriately, consistent with recognized guidelines.
 - a. In general, long-term subcutaneous administration of heparin in chronically bed-bound individuals is not indicated or of proven benefit for long-term DVT prophylaxis.
2. The physician will collaborate with the consultant pharmacist and nursing staff to identify potentially serious medication interactions with anticoagulants; for example, digoxin, dilantin, amiodarone, and many antibiotics.
 - a. The physician should adjust the anticoagulant dose or stop, taper, or change medications that interact with the anticoagulant, and/or monitor the PT/INR very closely while the individual is receiving warfarin, to ensure that the PT/INR stabilizes within a therapeutic range.

continues on next page

Monitoring and Follow-Up

1. The physician will order appropriate lab testing to monitor anticoagulant therapy and potential complications; for example, periodically checking hemoglobin/hematocrit, platelets, PT/INR, and stool for occult blood.
2. If warfarin is used, staff should use a warfarin flow sheet or some comparable means to follow trends in anticoagulant dosage and response in individuals on warfarin.
3. The physician will review the progress of individuals who are being anticoagulated; for example, to see whether recent-onset atrial fibrillation has resolved or to evaluate the status of any deep vein thrombosis.
4. The physician will periodically identify individuals whose anticoagulant can be discontinued or reduced (for example, resolved atrial fibrillation or sufficient time has elapsed since resolution of a deep vein thrombosis), and will document a rationale for continuing anticoagulation over time, including the medication and current dosage.
5. The staff and physician will monitor for possible complications in individuals who are being anticoagulated, and will manage related problems.
 - a. If an individual on anticoagulation therapy shows signs of excessive bruising, hematuria, hemoptysis, or other evidence of bleeding, the nurse will discuss the situation with the physician before giving the next scheduled dose of anticoagulant.
 - b. The physician will order measures to address any complications, including holding or discontinuing the anticoagulant as indicated.
 - c. In individuals receiving anticoagulation who are bleeding or who have a markedly elevated PT/INR, it may suffice to stop the anticoagulant and recheck the PT/INR if the individual is stable, there is no more than minor bleeding, and the INR is not more than 9. Once Vitamin K is given to try to reverse the effects of warfarin, it can hamper subsequent resumption of anticoagulation for a week or more.

Version	1.2 (H5MACL0007)

Atrial Fibrillation – Clinical Protocol

Assessment and Recognition

1. The physician will help identify individuals who have a history of atrial fibrillation including those who are currently receiving treatment related to a history of atrial fibrillation, such as antiarrhythmic medication and anticoagulation.
 - a. Based on reviewing available information (for example, hospital discharge summary or discussion with a treating cardiologist), the physician will try to differentiate new onset from chronic atrial fibrillation.
2. The physician and staff will assess and document the resident's heart rate, rhythm and characteristics, as well as any related findings, and clarify the rhythm where necessary (for example, by obtaining a rhythm strip or EKG).
 - a. Definitive identification of heart rhythm requires an EKG, rhythm strip, or other means, and cannot be done via physical examination alone.
3. In addition, the nurse shall assess and document/report the following:
 - a. Respiratory function, observing in particular for diaphoresis and difficulty breathing (dyspnea);
 - b. Onset, duration, frequency, intensity of symptoms;
 - c. Pain assessment. If chronic, comparison of pain to usual;
 - d. Relieving factors (such as antacids or nitroglycerin);
 - e. All current standing and PRN All current medications; and
 - f. Allergies.

Cause Identification

1. The physician will consider atrial fibrillation or another cardiac arrhythmia as a possible cause of, or contributing factor to, new symptoms or exacerbation of existing problems such as dyspnea, syncope, and congestive heart failure.
2. For new onset atrial fibrillation, the physician will determine whether causes have been identified and/or will evaluate further for possible causes such as hyperthyroidism and valvular heart disease.
 - a. The physician may wish to obtain a cardiology consultation, if needed.

Treatment/Management

1. The physician will treat atrial fibrillation, as indicated, in accordance with pertinent guidelines.
 - a. In residents with persistent atrial fibrillation or with atrial fibrillation that is likely to be recurrent, ventricular rate control combined with anticoagulation appears to be at least equivalent to a strategy of maintaining sinus rhythm by using currently available antiarrhythmic drugs in preventing clinical outcomes.
 - b. In most elderly residents with chronic or recurrent atrial fibrillation, and those with contraindications to antiarrhythmic medications, the preferred approach is rate control and anticoagulation, unless contraindicated.
 - c. Rhythm control may be helpful in individuals with new onset atrial fibrillation with a low risk for recurrence and those who have refractory congestive heart failure when they are not in sinus rhythm.

continues on next page

2. The physician will address the underlying cause(s) of acute atrial fibrillation where possible.
3. The physician will select medications, including anticoagulation, based on indications, efficacy, adverse effects, and contraindications, and also by considering the impact of—and interactions of—antiarrhythmic medications relative to the total current medication regimen.
4. The physician will select medications, including anticoagulation, based on indications, efficacy, adverse effects, and contraindications, and also by considering the impact of—and interactions of—antiarrhythmic medications relative to the total current medication regimen.
 - a. For rate control, atenolol, metoprolol, diltiazem, and verapamil may be most effective. Digoxin controls rate only at rest, so it should be considered a secondary medication to manage arrhythmias.
 - b. For individuals receiving amiodarone who cannot benefit from rate control and/or anticoagulation alone, long-term dosing should be as low as possible; for example, 50-100 mg per day if feasible. Toxicity increases with both the dosage and the duration of treatment. Serious complications can occur even at lower doses.
5. The physician will identify and adjust, stop, or change medications as needed to address any complications.

Monitoring and Follow-Up

1. The staff and physician will monitor closely for complications related to atrial fibrillation; for example, heart failure and stroke.
2. The staff and physician will monitor for side effects and complications related to treatments for atrial fibrillation; for example, bleeding related to anticoagulation, or confusion, dyspnea, heart failure, pneumonitis, or lung, eye, thyroid, and liver complications due to amiodarone or other antiarrhythmic medications.
 - a. For individuals receiving amiodarone, monitoring should include at least a yearly electrocardiogram and chest x-ray, semiannual liver enzymes and thyroid profile, and pulmonary function tests in those with significant pulmonary disease. The physician should also monitor for interactions with other drugs, such as digoxin and warfarin.
 - b. Complications due to amiodarone or other antiarrhythmic medications can include fatigue, dyspnea, cough, palpitations, falling, syncope, visual changes, skin changes, weight change, paresthesias, weakness, or sleep disturbances. Hypersensitivity pneumonitis should be suspected in individuals with new or progressive pulmonary symptoms or atypical pneumonia.
3. If another cause of those symptoms cannot readily be identified, then it may be prudent to taper or stop amiodarone or other antiarrhythmic medications based on review of the overall situation.

Heart Failure – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals with a history of heart failure (HF) and will clarify, as much as possible, its severity and underlying causes.
 - a. For example, an echocardiogram can help define valvular heart disease as well as systolic and diastolic left ventricular function and ejection fraction.
2. In addition, the nurse will assess and document/report the following:
 - a. Vital signs;
 - b. General physical assessment, including level of consciousness, abnormal neurological signs, diaphoresis;
 - c. Resident's age and sex;
 - d. All current medications, especially antihypertensive therapy;
 - e. Recent or current history of chest pain, headache, change in level of consciousness, dizziness, diaphoresis;
 - f. All active diagnoses;
 - g. Allergies; and
 - h. Resident's code status, plus any other advance directives and ethical decisions.
3. The physician will identify individuals who are receiving medications, or medication combinations, associated with treatment for HF; for example, diuretics, ACE inhibitors, and vasodilators.
4. The physician will help identify individuals at risk for having cardiac decompensation; for example, because of arrhythmia, decreased ejection fraction, chronic obstructive pulmonary disease, or hyperthyroidism.

Cause Identification

1. The physician will help identify or clarify causes of congestive heart failure; for example, valvular or hypertensive cardiovascular disease, hyperthyroidism, anemia, cardiomyopathy, etc., as well as the extent to which those causes are treatable or correctable.

Treatment/Management

1. The physician will review and make recommendations for relevant aspects of the nursing care plan; for example, what symptoms to expect, how often and what (weights, renal function, digoxin level, etc.) to monitor, when to report findings to the physician, etc.
2. The physician will address related medical issues; for example, adjust or stop medications that may be precipitating heart failure, modify doses of diuretics, determine whether oxygen is needed, etc.
3. The physician will document information related to the individual's prognosis and current signs and symptoms; for example, whether there is end-stage heart disease, the likelihood of the individual remaining stable or worsening in the near future, the presence of edema or lung findings, etc.
4. The physician will prescribe treatments for residents with heart failure that are consistent with relevant guidelines and protocols; for example, those of the American Heart Association and American Medical Directors Association (AMDA).

continues on next page

- The physician will help address ethical issues that arise in individuals with end-stage heart disease, such as the futility of CPR or the potential risks and benefits of hospitalization

Monitoring and Follow-Up

- The physician will help monitor the progress of individuals with HF, including ongoing evaluation and documentation of signs, symptoms, and condition changes.
- The physician will monitor the individual for adverse effects of medications used to treat HF; for example, digoxin toxicity or fluid and electrolyte imbalance in individuals receiving both diuretics and ACE inhibitors.

Version	1.3 (H5MACL0022)

Hypertension – Clinical Protocol

Assessment and Recognition

1. The staff and physician will identify individuals with a history of hypertension, those receiving antihypertensive medications, and those with identified complications of hypertension.
2. The staff and physician will identify individuals with possibly undiagnosed hypertension and those with poorly controlled hypertension.
 - a. Blood pressure should be measured correctly, including use of a properly sized cuff, in both arms, and where possible, in the upright position.
 - b. It is desirable to monitor and to report trends or patterns in blood pressure over a period of time, instead of reporting or responding to isolated or intermittent readings. Isolated or intermittent blood pressure elevations may warrant additional monitoring, but they rarely warrant immediate reporting or interventions.
3. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. General physical assessment, including level of consciousness, abnormal neurological signs, diaphoresis;
 - c. Resident's age and sex;
 - d. All current medications, especially antihypertensive therapy;
 - e. Recent or current history of chest pain, headache, change in level of consciousness, dizziness, diaphoresis;
 - f. All active diagnoses; and
 - g. Allergies.
4. The staff and physician will identify complications related to hypertension, such as a history of stroke, cardiomegaly, heart failure, retinal hemorrhages, renal failure, history of myocardial infarction, or aortic aneurysm.
 - a. Pertinent tests may include an electrocardiogram, renal function tests, electrolytes, calcium, and urinalysis. Other more specialized tests (for example, plasma aldosterone or renal arteriogram) may be ordered when an underlying cause is suspected based on clinical grounds.
5. The physician will help classify the severity of hypertension based on established criteria; for example:
 - a. Level 1: Systolic BP 140-159; diastolic BP 90-99.
 - b. Level 2: Systolic BP 160-179; diastolic BP 100-110.
 - c. Level 3: Systolic BP >180; diastolic BP >110.
 - d. Malignant or accelerated: sustained or sudden rise in systolic blood pressure above 220 mm Hg or diastolic blood pressure above 120 mm Hg, with accompanying evidence of end organ damage such as decreased renal function or encephalopathy.
 - e. Systolic: systolic pressure consistently greater than 140 mm Hg, with diastolic BP remaining below 90.

Cause Identification

1. The physician will confirm the diagnosis of hypertension if it was not previously verified, and help identify pertinent causes and contributing factors.

continues on next page

2. The physician will identify factors that may be causing or are associated with elevated or poorly controlled blood pressure; for example, hypercalcemia, excess salt intake, renovascular disease (such as renal artery stenosis), parenchymal renal disease (for example, glomerulonephritis), or endocrine disorders (for example, primary aldosteronism or pheochromocytoma).

Treatment/Management

1. In conjunction with the patient, family, and staff, the physician will establish targets for blood pressure treatment, monitoring, and reporting.
2. The physician will identify situations where hypertension should be treated, and will try to individualize treatment goals and blood pressure targets.
 - a. Treatment goals and blood pressure target ranges should be individualized based on considerations of causes, prognosis, comorbidities, risks of treatment-related complications, resident wishes, function, and quality of life.
 - b. In very old individuals, and in other individuals with additional risk factors the risks of aggressive blood pressure reduction may outweigh the benefits.
3. The physician will treat hypertension based on established guidelines.
 - a. As much as possible, medications should be selected based on underlying causes, comorbidities, risk factors, and potential or actual adverse consequences. For example, clonidine is not recommended in the elderly because of its significant side effects in older individuals such as depression and lethargy.
4. In conjunction with the patient or substitute decision maker, the physician and staff will identify pertinent additional measures such as no added salt diets, weight reduction, smoking cessation, and increased exercise and activity.
 - a. Except in complicated or hard-to-control hypertension, markedly reduced (2 to 4 gram) sodium diets are rarely helpful and usually not well tolerated.

Monitoring and Follow-Up

1. The staff and physician will periodically monitor the individual's blood pressure control and cardiac function (including complications) and the physician will adjust treatments accordingly.
 - a. This should generally be based on blood pressure measurements over time, not just on isolated readings or fluctuations.
2. For any individual whose blood pressure is not well controlled despite receiving three or more antihypertensive medications, the physician will reassess the situation and review the existing blood pressure treatment regimen carefully before prescribing any additional medications.
 - a. Existing medications may not be effective and/or other medications or medical conditions may be causing or contributing to inadequate control. In such cases, adding more medications to a regimen that is not effective may increase side effects rather than help control blood pressure.
3. The physician will identify situations where consultative assistance in managing blood pressure is desired; for example, labile hypertension and/or identification or suspicion of less common, complex, or multiple underlying causes.
 - a. If a consultant is requested to help manage hypertension, the Attending Physician will retain an active role by reviewing the consultant's recommendations, addressing relevant medical issues, helping monitor for complications related to treatment, and evaluating subsequent progress.
 - b. The physician should not simply defer to the consultant for everything related to hypertension management.

continues on next page

4. The staff and physician will monitor for complications of blood pressure treatments such as fluid and electrolyte imbalance, postprandial or orthostatic hypotension, dizziness, falling, anorexia, bradycardia, and depression.
 - a. Over-treating blood pressure may increase the risk of significant side effects and complications, such as falling and fractures, especially in compromised or frail individuals.
5. If treatment-related complications are identified, the physician should review the situation carefully and consider adjusting, stopping, or switching medications to those with a lower risk of clinically significant complications, or document why the current treatments are still warranted despite the risks.

Version	1.3 (H5MACL0003)

Stroke/TIA – Clinical Protocol

Assessment and Recognition

1. The physician will help identify individuals who have had or who are at risk for having a transient ischemic attack (TIA) or stroke.
2. The staff will identify and report individuals with symptoms that could indicate a current transient ischemic attack or stroke.
3. Signs and symptoms of acute ischemic stroke may include:
 - a. Sudden onset of confusion;
 - b. Difficulty speaking;
 - c. Difficulty understanding speech;
 - d. Sudden loss of vision in one eye;
 - e. Sudden difficulty walking;
 - f. Severe dizziness, loss of balance or coordination;
 - g. Sudden numbness or unilateral weakness of the face, arm or leg; or
 - h. Sudden severe headache without another identifiable cause.
4. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Neurological abnormalities;
 - c. Change in mental status and level of consciousness;
 - d. Resident's age and sex;
 - e. Onset, duration, severity, scope of abnormality;
 - f. History of stroke, other neurological disorder, oropharyngeal surgery or tumors;
 - g. All active diagnoses; and
 - h. All current medications.
5. The physician will identify whether symptoms could represent a stroke or another condition or problem.
 - a. Staff should carefully describe signs and symptoms including the resident's current level of consciousness, cognitive ability, speech, physical function, overall physical condition, and should compare the resident's current status to his/her usual (baseline) level of consciousness, cognition, physical function and overall physical condition.
 - b. Many symptoms associated with stroke are not specific, and could represent other causes such as adverse drug reactions, seizure disorder, fluid and electrolyte imbalance or infection.
 - c. Unilateral facial weakness, unilateral limb weakness, or difficulty with speech that is new or represents a decline from previous function may be more specific indicators of acute stroke.
 - d. Diagnosis of acute stroke, and recommendations for treatment, are based on current recognized standards of practice (e.g., American Heart Association/American Stroke Association).
6. If a new stroke is suspected, the physician will evaluate whether hospital transfer is indicated for additional evaluation and treatment. Factors that may influence the appropriateness of hospitalization include:
 - a. Medical instability or presence of significant complications;
 - b. Level of function prior to symptom onset;
 - c. Resident and family perception of quality of life and treatment goals;

continues on next page

- d. Resident wishes as expressed in advance directives or discussions;
- e. Ready availability of emergency and hospital services; and
- f. The facility's ability to provide timely and appropriate evaluation, treatment, and monitoring for an acute stroke..

Cause Identification

1. For individuals with a new stroke who are not hospitalized, or for individuals who have a completed stroke, the physician will order appropriate tests to help confirm the diagnosis, rule out other causes of symptoms, clarify the category of the stroke (if it can be confirmed), define causes and modifiable risk factors, and identify the nature and severity of stroke-related deficits and complications.
 - a. Where appropriate testing is available, strokes may be classified by location and/or as thrombotic, embolic, or hemorrhagic based on their underlying cause.
 - b. Depending on the clinical situation, examples of potentially relevant tests could include serum creatinine, BUN, electrolytes, glucose, complete blood count (CBC), and platelets; transcranial Doppler, brain CT scan, carotid duplex ultrasound examination, echocardiogram, chest x-ray, electrocardiogram, prothrombin time/INR, magnetic resonance imaging (MRI) or magnetic resonance arteriography (MRA) of the brain; liver function tests, toxicology screen, lumbar puncture, serum ammonia, or blood alcohol level..

Treatment/Management

1. The staff and physician will identify appropriate interventions related to acute stroke, post-stroke care for someone who has recently had a stroke, and measures to try to prevent first or recurrent stroke.
 - a. Examples of preventive measures might include anticoagulation therapy in individuals with chronic atrial fibrillation, controlling hypertension, stabilizing blood sugars, encouraging smoking cessation, modifying diet, and optimizing mobility and physical activity.
 - b. Examples of appropriate post-stroke interventions might include rehabilitation therapies, communication support, measures to try to prevent skin breakdown and contractures, aspiration precautions, additional assistance with activities of daily living (ADLs), and safety measures while ambulating.
2. The staff and physician will identify and treat stroke-related complications such as pain, urinary tract infections, deep vein thrombosis, and depression.

Monitoring

1. The staff and physician will monitor the medical, functional, and psychological status of individuals with a new or old stroke and modify interventions accordingly and consistent with the resident's wishes and prognosis.
2. The staff and physician will review the status of modifiable risk factors such as elevated blood pressure, glucose, and lipids and institute or adjust treatments accordingly.
 - a. The physician and staff will identify and address ethical issues related to individuals with new or old strokes; for example, whether to resuscitate, hospitalize, or provide artificial nutrition and hydration.

continues on next page

Administration of Inotropic Therapy

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic administration of intravenous inotropic drug therapy in order to increase cardiac contractility, promote vasoconstriction and increase heart rate for residents with end-stage heart failure.

Preparation

1. A physician's order is necessary for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.
4. The licensed nurse responsible for administering inotropic therapy shall be knowledgeable of:
 - a. indications for use;
 - b. appropriate doses and diluents;
 - c. side effects;
 - d. monitoring parameters;
 - e. toxicities;
 - f. incompatibilities;
 - g. stability;
 - h. storage requirements; and
 - i. potential complications.

General Guidelines

1. Administer dopamine, a vesicant, through a central venous access device only.
2. When administering inotropic medications, use an electronic infusion device to monitor rate of infusion.
3. Whenever practical, the first dose of any intravenous medication should be administered in a controlled environment (e.g., hospital, ambulatory clinic, or physician's office).
4. If the medication to be infused is the first dose, obtain an order for an anaphylactic protocol before administering the medication and observe the resident for a minimum of one hour after completion of the infusion.
5. Use a separate administration set for each medication.

Equipment and Supplies

1. Prescribed medication;
2. Administration set;
3. Saline or heparin for flush, as appropriate;
4. Needleless access device/adaptor;
5. Electronic infusion pump;
6. Gloves;
7. Alcohol swabs or pledgets; and
8. Tape.

continues on next page

Assessment

1. Inspect intravenous catheter site for signs of infection and/or complications at scheduled intervals and upon routine site care and administration set changes.
2. Prior to administration of inotropic medications assess resident's:
 - a. cardiovascular status;
 - b. baseline vital signs, height and weight;
 - c. blood pressure and pulse parameters;
 - d. code status;
 - e. laboratory results, including electrolytes, BUN, and serum creatinine (assess for appropriateness of therapy); and
 - f. history of allergies.
3. Assess resident every 15 minutes during the first hour of infusion and every four hours during infusion.
4. Weigh resident daily.
5. Monitor mental status.
6. Review physician's order. Confirm type of medication, route, and rate of administration.
7. Verify the identity of the resident.
8. Check medication label and verify against the order.
9. Inspect medication for any leaks, cracks, precipitate, and expiration date.

Steps in the Procedure

1. Perform hand antisepsis and don gloves.
2. Prime tubing of administration set.
3. Disinfect catheter injection/access port.
4. Flush catheter, if appropriate.
5. Connect primed administration set to catheter injection/access port. (**Note:** Administer dopamine through a central venous access device only.)
6. Open roller clamp.
7. Establish prescribed rate of flow using an electronic infusion pump.
 - a. Follow orders for amount to be infused and duration.
 - b. Follow manufacturer's directions to program pump.
 - c. Program to achieve desired flow rate.
8. Begin infusion.
9. Administer inotropic medications continuously as ordered.
10. Change administration set as indicated, per protocol.
11. Instruct resident on expected outcomes and potential side effects.
12. Document procedure in the resident's medical record.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the medication was administered.
2. The type of medication administered.
3. The amount of medication administered.
4. The route of administration.
5. The rate of administration.

continues on next page

6. Notification of the physician, if any.
7. Resident’s response.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Applying a Pneumatic Compression Device (PCD)

Level III

Purpose

The purpose of this procedure is to increase venous return to the heart, to decrease venous pooling and stasis, reduce edema, and to prevent complications associated with deep vein thrombosis (DVT) and pulmonary embolism (PE).

Preparation

1. Verify that there is a physician's order for PCD application and removal. If there is no order for the procedure, contact the Attending Physician to obtain orders. (Note: Document the receipt of telephone orders in the resident's medical record.)
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.
4. Always follow manufacturer's instructions and physician orders when applying PCDs.

General Guidelines

1. PCDs should be worn at all times during treatment cycle (i.e., sitting in chair).
2. If PCD is removed for longer than three (3) hours, do not reapply without notifying physician.
3. PCDs may be applied over anti-emboli stockings for added support and to reduce skin irritation from the PCD.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Tape measure;
2. PCD sleeves (knee-length or thigh-length);
3. Pump;
4. Tubing;
5. Anti-emboli stockings, if ordered; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Assessment

1. Prior to initiating treatment with a PCD:
 - a. Assess the resident for the following conditions, in which PCDs are contraindicated:
 - (1) Acute or pre-existing DVT or PE;
 - (2) Peripheral vascular ischemia;
 - (3) Open wounds, including surgical, skin grafts, infection, gangrene, and dermatitis;
 - (4) Malignancy in the leg(s);
 - (5) Deformity of the leg(s); and/or
 - (6) Congestive Heart Failure, including heart and lung sounds.
 - b. Notify physician if the resident is observed with any condition in which PCD is contraindicated.
 - c. Measure the circumference of the thigh.
 - d. Obtain correct size sleeves.

continues on next page

2. Every four hours after application:
 - a. Assess diastolic blood pressure, pulses, and subjective data from resident. Assess for signs and symptoms of DVT or PE.
 - (1) Remove the PCD if resident's diastolic blood pressure falls below 35 mmHg.
 - (2) Remove PCD if resident experiences numbness, tingling, or leg pain.
 - (3) Remove if pulses (dorsalis pedis and/or posterior tibial) are absent on maximum inflation of the PCD.
 - (4) If signs or symptoms of DVT or PE develop, discontinue use and notify physician.
3. Every eight hours after application:
 - a. Assess the position of the sleeves and tubing. Check connections to the air pump.
 - b. Check cooling unit and alarm.
 - c. Remove device and assess condition of the legs and skin.
 - d. Assess resident's level of comfort.
 - e. Check maximum inflation pressure setting.

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. Assist the resident to a semi-Fowler's position.
4. Apply anti-emboli stockings, if ordered.
5. Attach tubing to the sleeves.
6. Apply compression sleeves according to manufacturer's instructions.
7. Attach tubing to the air pump ensuring that there are no kinks in the tubing.
8. Plug air pump into power outlet.
9. Turn power switch to the ON position.
10. Adjust the inflation pressure as ordered. Ankle pressure should be set no higher than 55 mmHg unless specifically ordered by physician.
11. Turn the cooling unit and alarm to their ON positions.
12. Discard all disposable items in designated receptacles.
13. Discard personal protective equipment (if used) in designated receptacles.
14. Perform hand antisepsis.
15. Reposition the bed covers. Make the resident comfortable.
16. Place the call light within easy reach of the resident.
17. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time of application.
2. Type of sleeves used.
3. Whether sleeves are applied bilaterally or unilaterally.
4. Assessment data gathered before and after the procedure.
5. The resident's response to the procedure.
6. The schedule of removal and reapplication.

continues on next page

7. If the resident refused the treatment, the reason(s) why and the intervention taken.
8. The name and title of the individual(s) who performed the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Applying Anti-Emboli Stockings (TED Hose)

Level III

Purpose

The purpose of this procedure is to improve venous return to the heart, to improve arterial circulation to the feet, to minimize edema to the legs and feet, and to prevent complications associated with deep vein thrombosis and pulmonary embolism.

Preparation

1. Verify that there is a physician's order for anti-emboli stockings. If there is no order for anti-emboli stockings, contact the Attending Physician to obtain orders. (Note: Document the receipt of telephone orders in the resident's medical record.)
2. Review the resident's care plan to assess for any special needs of the resident, including any potential or existing circulatory problems.
3. Follow the manufacturer's instructions for measuring and fitting anti-emboli stockings. Stockings that are sized incorrectly can increase the risk of pressure and skin irritation, causing harmful pressure gradients which impede blood flow.
4. Measure the resident for the appropriate size stockings.
 - a. **Thigh-length stockings.** Measure from the gluteal fold to the heel.
 - b. **Knee-length stockings.** Measure from the popliteal fossa (bend of the knee) to the heel.
 - c. Measure the circumference of both calves and both thighs (at the widest point).
5. Choose the appropriate size stocking from the manufacturer's chart. (Note: Use different size stockings for each leg, if necessary, to obtain as accurate a size as possible.)
6. Assemble the equipment and supplies as needed.

General Guidelines

1. If possible, anti-emboli stockings should be applied in the morning, prior to the resident getting out of bed.
2. Remove the stockings every eight (8) hours and inspect the skin. Leave the stockings off for 30 minutes and then reapply, as ordered.
3. Wash stockings every 2 to 3 days with warm water and mild soap.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Tape measure;
2. Anti-emboli stockings; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Assessment

1. Assess the lower extremities for:
 - a. posterior tibial and dorsalis pedis pulses (e.g., rate, volume, rhythm);
 - b. skin color, temperature and condition, skin irritation, and open areas;
 - c. presence of edema (unilateral or bilateral), distended veins, or pain; and/or
 - d. pain or tenderness in the calf.

continues on next page

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. If the resident has been ambulating, instruct him/her to lie down in bed with feet elevated for 15 to 30 minutes prior to applying the stockings.
4. If the resident has been sitting, assist him/her to a lying position in bed.
5. Wash and dry the legs.
6. Apply the stockings:
 - a. With one hand inside the stocking, hold onto the ankle and invert the stocking so that the upper portion is folded back and the foot portion of the stocking is inside the fold.
 - b. Instruct the resident to point his/her toes to facilitate proper positioning.
 - c. Ease the stocking over the toes and position the heel and toe portions of the stocking appropriately.
 - d. Smooth folds and creases along the legs. Do not roll down or bunch the stocking at the top.
 - e. The top of **knee length** stockings should be 1 to 2 inches below the popliteal fossa.
 - f. The top of **thigh length** stockings should be at the gluteal fold. The gusset should be rotated toward the anterior portion of the leg so that it rests above the femoral artery.
7. Discard all disposable items in designated receptacles.
8. Discard personal protective equipment (if used) in designated receptacles.
9. Perform hand antisepsis.
10. Reposition the bed covers. Make the resident comfortable.
11. Place the call light within easy reach of the resident.
12. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that anti-emboli stockings were applied.
2. The stocking size and length.
3. The assessment data gathered prior to the procedure.
4. The resident's response to the procedure.
5. The schedule of removal and reapplication.
6. If the resident refused the treatment, the reason(s) why and the intervention taken.
7. The name and title of the individual(s) who performed the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR0023)

Pacemaker, Care of a Resident with

Level III

Purpose of the Procedure

The purpose of this procedure is to provide information about and guidance for the care of a resident with a pacemaker.

Definitions

1. An abnormality in the conduction of electrical impulses that affects the normal heart rhythm is an *arrhythmia*.
2. The two most common arrhythmias that require a pacemaker are sinus bradycardia and heart block.
 - a. *Sinus bradycardia* occurs when the sinoatrial node is not functioning properly, resulting in an abnormally slow rhythm.
 - b. *Heart block* occurs when there is a slowing or complete blockage of the electrical conductivity in the heart.
3. Pacemakers are electronic devices that artificially stimulate the heart muscle with electrical impulses when the heart rhythm is too slow (bradycardia).
4. Pacemakers are programmed to sense the heart and respiratory rate and to administer electrical pulses when the heart rate falls below a set threshold.
5. Pacemakers can be permanently implanted or temporary.
 - a. Permanent pacemakers are surgically implanted when the cause of arrhythmia is chronic and it has been determined that the cause is not transient.
 - b. Typically pacemakers are implanted just below the clavicle, under the skin but above the pectoral muscle. The leads run through the veins and are secured at the heart muscle. The other ends of the leads are attached to the pulse generator.
 - c. Note: Implanted pacemakers are NOT THE SAME as implantable cardioverter.

Complications

1. If the pulse generator or battery fails, or if the leads become displaced the pacemaker may not work properly, leading to bradyarrhythmias.
2. The following devices or procedures MAY interfere with pacemaker functioning:
 - a. Cell phones and MP3 players (for example, iPods);
 - b. Household appliances, such as microwave ovens;
 - c. High-tension wires;
 - d. Metal detectors;
 - e. Industrial welders;
 - f. Electrical generators;
 - g. Magnetic resonance imaging (MRI) machines;
 - h. Radiation machines for treating cancer;
 - i. Shock-wave lithotripsy; and
 - j. Electrocauterization.

continues on next page

3. The following items will NOT interfere with pacemaker functioning:
 - a. CB radios;
 - b. Electric drills;
 - c. Electric blankets;
 - d. Electric shavers;
 - e. Ham radios;
 - f. Heating pads;
 - g. TV transmitters;
 - h. TV remote controls; and
 - i. X-ray machines.

Monitoring

1. Monitor the resident for pacemaker failure by monitoring for signs and symptoms of bradyarrhythmias.
2. Symptoms associated with bradyarrhythmias may include:
 - a. Syncope (fainting);
 - b. Shortness of breath;
 - c. Dizziness;
 - d. Fatigue; and/or
 - e. Confusion.
3. The pacemaker battery will be monitored remotely through the telephone or an internet connection. The resident's cardiologist will provide instructions on how and when to do this.
4. The resident will have an EKG annually, or as ordered, to monitor for changes in the heart's electrical activity.
5. Make sure the resident has a medical identification card that indicates he or she has a pacemaker. The medical record must contain this information as well. When the resident is transferred to another facility, this information must be communicated to the receiving facility in the discharge summary.
6. Pacemaker batteries and generator will be replaced by a cardiologist as needed, usually every five to eight years.

Documentation

1. For each resident with a pacemaker, document the following in the medical record and on a pacemaker identification card upon admission:
 - a. The name, address and telephone number of the cardiologist;
 - b. Type of pacemaker;
 - c. Type of leads;
 - d. Manufacturer and model;
 - e. Serial number;
 - f. Date of implant; and
 - g. Paced rate.

continues on next page

2. When the resident's pacemaker is monitored by the Physician, document the date and results of the pacemaker surveillance, including:
 - a. How the resident's pacemaker was monitored (phone, office, internet);
 - b. Type of heart rhythm;
 - c. Functioning of the leads;
 - d. Frequency of utilization; and
 - e. Battery life.

Diabetes – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals with elevated blood sugar, impaired glucose tolerance, or confirmed diabetes, as well as factors that may influence glucose tolerance; for example, medications including prednisone, thiazide diuretics or some antipsychotic medications.
2. For residents who meet the criteria for diabetes testing, the physician will order pertinent screening; for example, A1C, fasting plasma glucose, or 2-hour plasma glucose with oral glucose load.
3. For residents with confirmed diabetes, the nurse shall assess and document/report the following during the initial assessment:
 - a. Resident's age and sex;
 - b. Level of consciousness, change in orientation;
 - c. Dose and time of most recent anti-hyperglycemic given;
 - d. All other current medications;
 - e. Any signs or symptoms of infection (urine, skin/wound, upper respiratory, etc.) or other acute illnesses;
 - f. Usual patterns of eating and drinking;
 - g. Approximate intake over last 24 hours;
 - h. Recent change in intake/thirst;
 - i. Resident's blood sugar history over 48 hours;
 - j. Usual patterns (fluctuations, trends) of blood sugar over recent months;
 - k. Onset, duration of any changes; and
 - l. Recent labs.
4. Criteria for the diagnosis of diabetes will be based on current American Diabetes Association guidelines.
5. The Physician will evaluate findings to distinguish individuals with diabetes from those having impaired glucose tolerance or impaired fasting glucose ("pre-diabetes").
6. The Physician and staff will identify significant comorbidities (e.g., heart failure or stroke) that may influence to approach to diabetes for that patient, as well as complications or risk of complications that may be related to diabetes; for example, impaired renal function, impaired vision or peripheral neuropathy.
7. In addition to physical assessment, pertinent lab tests might include renal function, serum lipid profile, and urinalysis (especially, looking for glycosuria and proteinuria).

Cause Identification

1. The Physician and staff will summarize factors that are contributing to, or conditions that are affected by, the resident's diabetes or glucose intolerance and will assess the impact of diabetes on the individual's function and quality of life.

continues on next page

Treatment/Management

1. Based on the preceding assessment, including causes and complications, the Physician will order appropriate interventions, which may include:
 - a. Treatment of underlying conditions causing impaired glucose tolerance;
 - b. Physical activity, diet and lifestyle modifications, where feasible and accepted by the resident;
 - c. Oral hypoglycemia agents; and/or
 - d. Insulin.
2. These treatments should be consistent with applicable guidelines. For example, insulin may be indicated when:
 - a. diet, exercise, and oral medication combinations have failed to adequately control blood glucose levels; or
 - b. oral medications are contraindicated.
3. Resident preferences should be taken into account; for example, if someone who understands the risks chooses to take oral medication but will not accept insulin injections.
4. The Physician will address complications such as dyslipidemia, coronary artery disease, neuropathy, and nephropathy based on the individual's overall condition, prognosis, function, and treatment preferences.
5. Based on factors including the individual's overall condition, prognosis, function, and treatment preferences, the physician will address, to the extent possible, complications such as dyslipidemia, coronary artery disease, neuropathy, and nephropathy.

Related Considerations

1. Risk of hypoglycemia should be considered in any treatment plan, as it is a significant and high-risk complication of treatment. It may be necessary to accept somewhat higher blood sugars in order to minimize the risk of hypoglycemia.
2. As a general rule, primary or sole use of sliding scale insulin is not a preferred way to handle diabetes over the long term. If short-acting insulin has to be administered frequently, the physician should consider initiating or adjusting the dose of an intermediate- or long-acting insulin.
3. The idea of a “diabetic diet” is outdated and dietary restrictions may be liberalized in most patients.
4. Where insulin is indicated, simplified treatment regimens are preferred, using long-acting insulin and – if necessary – routine supplemental (not sliding scale) intermediate- or shorter-acting insulin.

Monitoring and Follow-Up

1. The Physician will follow up on any acute episodes associated with a significant sustained change in blood sugars or significant deterioration of previous glucose control and document resident status at subsequent visits until the acute situation is resolved.

continues on next page

2. As indicated, the Physician will order appropriate lab tests (for example, periodic finger sticks or A1C) and adjust treatments based on these results and other parameters such as glycosuria, weight gain or loss, hypoglycemic episodes, etc.
 - a. Examples of blood glucose monitoring for various situations might include the following:
 - (1) For the resident on oral medication(s) who is well controlled: monitor blood glucose levels at least twice weekly (or more frequently if there is a change in drugs or drug dosages); monitor A1C on admission (if no results from a previous test are available) or when diabetes is diagnosed and every 3 to 6 months thereafter.
 - (2) For the resident receiving oral medication(s) who is poorly controlled: monitor blood glucose levels twice to four times daily as needed; monitor A1C on admission (if no results from a previous test are available) or when diabetes is diagnosed, and every 3 months thereafter until stable.
 - (3) For the resident receiving insulin who is well controlled: monitor blood glucose levels twice a day if on insulin (for example, before breakfast and lunch and as necessary); monitor 3 to 4 times a day if on intensive insulin therapy or sliding-scale insulin; monitor as indicated if the individual is fasting before a medical procedure, has returned to the facility after a significant absence, or has an acute infection or illness. Monitor A1C on admission (if no results from a previous test are available) or when diabetes is diagnosed, and every 6 months thereafter. Adjust monitoring frequency depending on glucose control and resident preference.
3. The Physician will authorize pertinent periodic evaluations such as ophthalmology and nephrology, as indicated.
4. The Physician will order desired parameters for monitoring and reporting information related to blood sugar management.
 - a. The staff will incorporate such parameters into the Medication Administration Record and care plan.
5. The staff will identify and report issues that may affect, or be affected by, a patient's diabetes and diabetes management such as foot infections, skin ulceration, increased thirst, or hypoglycemia.
 - a. For example, urgent notification may be indicated if the individual has not eaten well or consumed sufficient fluids for 2 or more days and has fever, hypotension, lethargy or confusion.
 - b. The Physician will help the staff clarify and respond to these episodes.
6. The staff and Physician will manage hypoglycemia appropriately.
 - a. It is important to avoid excessive diabetes management that leads to recurrent episodes of hypoglycemia. For example, a realistic target for A1C in frail older individuals is between approximately 7 and 8, while A1C consistently under 7 is unlikely to provide significant additional benefits, but may expose the individual to recurrent hypoglycemia.
 - b. It is important to avoid over-treatment of hypoglycemia, which can result in rebound hyperglycemia and hamper subsequent glucose control.
 - (1) For example, a borderline low blood sugar in the absence of signs and symptoms may not need any acute intervention, and may or may not suggest the need to modify oral hypoglycemia medications or insulin.
 - (2) An example of appropriate treatment of hypoglycemia for a responsive individual would be 15 g to 20 g of carbohydrate in the form of glucose, sucrose tablets, or juice, combined with a sandwich, crackers, or other light snack containing protein.
 - (3) For someone who is lethargic but not comatose, treatment might include oral glucose paste rubbed onto the buccal mucosa, intramuscular glucagon, or intravenous 50% dextrose.

continues on next page

7. The IDT will monitor the resident for conditions that are frequently associated with diabetes, including:
 - a. depression;
 - b. sleep apnea;
 - c. cancer;
 - d. fractures;
 - e. cognitive impairment; and
 - f. periodontal disease.

Insulin Administration

Level III

Purpose

To provide guidelines for the safe administration of insulin to residents with diabetes.

Preparation

1. Only appropriately licensed or certified personnel shall draw and administer insulin.
2. Only the person who draws up the insulin for injection can inject it.
3. The type of insulin, dosage requirements, strength, and method of administration must be verified before administration, to assure that it corresponds with the order on the medication sheet and the physician's order.
4. The nurse shall notify the Director of Nursing Services and Attending Physician of any discrepancies, before giving the insulin.
5. The nursing staff will have access to specific instructions (from the manufacturer if appropriate) on all forms of insulin delivery system(s) prior to their use.
6. Residents who are capable of managing their glucose monitoring and/or insulin administration must be assessed periodically for their ongoing willingness and ability to do so safely and effectively.
7. Any resident who is actively involved in glucose monitoring and insulin administration will be provided with diabetes self-care education (as appropriate), and supported by the staff person designated for diabetes teaching and management.

General Guidelines

Characteristics and Types of Insulin

1. The three key characteristics of insulin are:
 - a. Onset of action – how quickly the insulin reaches the bloodstream and begins to lower blood glucose;
 - b. Peak effects – the time when the insulin is at its maximum effectiveness; and
 - c. Duration of effects – the length of time during which the insulin is effective.
2. The four types of insulin and their characteristics are:

Type	Onset*	Peak*	Duration*
Rapid-acting	10-15 min	0.5-3 hrs	3-6 hrs
Regular/short-acting	0.5-1hr	2.5-5 hrs	8-12 hrs
NPH/Intermediate-acting	1-1.5 hrs	4-12 hrs	24 hrs
Long-acting	1-2 hrs	up to 8 hrs	up to 24 hrs
(*varies with manufacturer – see package inserts)			

3. Premixed insulins (products that combine different types of insulin) are also available. Insulin may be premixed in an insulin pen or syringe.
4. Injectable insulin comes in concentrations of 100 units per mL liquid. Orders for insulin should always be written as “Units,” rather than “U.”

continues on next page

Insulin Delivery

The forms of insulin delivery include:

1. Syringes – insulin syringes must match the unit dose (e.g., 100 unit/mL insulin must be administered in a 100 unit/mL insulin syringe).
2. Pumps – provide continuous insulin delivery (basal insulin) and manual or programmed surges (bolus insulin) at mealtime or other times via a catheter.
3. Pens – containing insulin cartridges deliver insulin subcutaneously through a needle.
4. Jet Injectors – inject insulin as a fine stream into the skin. (These may be advantageous for residents who fear needles, but long-term use is not recommended.)
5. Inhaled – powdered inhalable insulin (Exubera®) is rapid-acting insulin that may be prescribed to replace injectable rapid-acting insulin for some residents.

Equipment and Supplies (Insulin Injections via Syringe)

1. Glucose monitoring device
2. 100-unit insulin syringe (0.3, 0.5, 1, or 2mL capacity)
3. Insulin vial
4. Alcohol wipes

Steps in the Procedure (Insulin Injections via Syringe)

1. Wash hands.
2. Check blood glucose per physician order or facility protocol.
3. Remove insulin vial from storage point.
4. Check expiration date, if drawing from an opened multi-dose vial. If opening a new vial, record expiration date and time on the vial (follow manufacturer recommendations for expiration after opening).
5. Inspect the vial for frosting, precipitation, change in color/clarity, or clumping (if any of these are present, discard the vial and open a new one). Rapid-, short-, and long-acting insulins should all be clear. Intermediate-acting (isophane insulin) and combinations should be cloudy.
6. Gently roll the insulin vial between the palms of both hands to resuspend the insulin.
7. Check and re-check that the type of insulin on the vial matches the type of insulin ordered.
8. Check the order for the amount of insulin.
9. Disinfect the top of the vial with an alcohol wipe.
10. Create a vacuum in the vial by injecting air into the vial in the amount equal to the dose of insulin.
11. When mixing rapid- or short-acting insulin with intermediate- or long-acting insulin, draw the rapid- or short-acting insulin into the syringe first.
12. Double check the order for the amount of insulin.
13. Insert the syringe into the vial and pull back on the plunger until the ordered amount of insulin is in the syringe.
14. Inspect the syringe for air bubbles. Tap gently on the upright syringe to remove air.
15. Re-check that the amount of insulin drawn into the syringe matches the amount of insulin ordered.
16. Select an injection site.
 - a. Insulin may be injected into the subcutaneous tissue of the upper arm, and the anterior or lateral areas of the thighs and abdomen. Avoid the area approximately 2 inches around the navel.
 - b. Injection sites should be rotated, preferably within the same general area (abdomen, thigh, upper arm).

continues on next page

17. Clean the injection site with an alcohol wipe and allow to air dry.
18. Lightly grasp a fold of skin and insert the needle into the skin at a 90° angle. For very thin residents, insert at a 45° angle to avoid intramuscular injection.
19. Depress the plunger and remove the needle after approximately five (5) seconds.
20. Dispose of the needle in a designated container.
21. Wash hands.

Documentation

1. The resident's blood glucose result, as ordered;
2. The dose and concentration of the insulin injection;
3. Size and gauge of the needle used for injection;
4. Injection site (presence or absence of any bruising, pain, redness, swelling or unusual marks on or near the injection site); and
5. How well the resident tolerated the procedure.

Reporting

1. Notify your supervisor if the resident refuses the insulin injection.
2. Notify the physician if the resident has signs and symptoms of hypoglycemia that are not resolved by following the facility protocol for hypoglycemia management.
3. Report excessive bruising, swelling, pain, redness, or unusual marks on or around the injection site.

Version	1.2 (H5MAPR0302)

Management of Hypoglycemia

Level III

Purpose

To provide guidelines for managing hypoglycemia secondary to insulin therapy or therapy with oral hypoglycemic agents (sulfonylureas, meglitinides, biguanides, thiazolidinediones, α -glucosidase inhibitors, or DPP-4 inhibitors) in the diabetic resident.

Symptoms of Hypoglycemia

1. Signs and symptoms of hypoglycemia usually have a sudden onset and may include the following:
 - a. Weakness, dizziness, or faintness;
 - b. Restlessness and/or muscle twitching;
 - c. Tachycardia (increased heart rate);
 - d. Pale, cool, moist skin;
 - e. Excessive perspiration;
 - f. Irritability or bizarre changes in behavior;
 - g. Blurred or impaired vision;
 - h. Headaches;
 - i. Numbness of the tongue and lips/thick speech;
 - j. (More severe) stupor, unconsciousness and/or convulsions; and
 - k. (More severe) coma.

Management of Hypoglycemia

The following is a suggested protocol that should not be implemented without the approval of the Medical Director and Director of Nursing. If there is already a protocol in place, disregard this and follow the existing approved protocol instead.

1. Classification of hypoglycemia:
 - a. Level 1 hypoglycemia: blood glucose <70 mg/dL but > 54 mg/dL;
 - b. Level 2 hypoglycemia: blood glucose is <54 mg/dL; and
 - c. Level 3 hypoglycemia: altered mental and/or physical status requiring assistance for treatment of hypoglycemia.
2. For Level 1 hypoglycemia (<70 mg/dl):
 - a. Give the resident an oral form of rapidly absorbed glucose (15-20 grams);
 - b. Notify the provider immediately;
 - c. Remain with the resident;
 - d. Recheck blood glucose in 15 minutes:
 - (1) If blood glucose is within established reference range, provide the resident with a meal or snack;
 - (2) If blood glucose is greater than established reference range (rebound hyperglycemia) administer diabetic medications as ordered; or
 - (3) If blood sugar remains < 70 mg/dL repeat oral glucose and notify physician for further orders.

continues on next page

3. For Level 2 hypoglycemia (<54 mg/dL):
 - a. Administer glucagon (intranasal, intramuscular, or as provided);
 - b. Notify the provider immediately;
 - c. Remain with the resident;
 - d. Place resident in a comfortable and safe place (bed or chair);
 - e. Monitor vital signs; and
 - f. Recheck blood glucose in 15 minutes (as above).
4. If a resident has Level 3 hypoglycemia and is unresponsive:
 - a. Call 911 (in accordance with resident's advance directives);
 - b. Administer glucagon (intranasal, intramuscular, or as provided);
 - c. Notify the provider immediately;
 - d. Remain with the resident;
 - e. Place resident in a comfortable and safe place (bed or chair); and
 - f. Monitor vital signs.

Documentation

1. Document the resident's blood glucose before intervention.
2. Note blood sugar after each administration of rapid-acting glucose and the follow-up blood sugar.
3. Record the resident's level of consciousness before and after intervention.
4. Document provider instructions.

Nursing Care of the Older Adult with Diabetes Mellitus Level III

Purpose

To provide an overview of diabetes in the older adult, its symptoms and complications, and the principles of glucose monitoring. For further diabetes education and guidelines, refer to the provider orders and instructions as well as the American Diabetes Association, *Standards of Medical Care in Diabetes*.

Symptoms Associated with Diabetes

1. Hyperglycemia. Uncontrolled diabetes from lack of insulin or inadequate insulin results in hyperglycemia (blood sugar above target levels). Signs and symptoms of hyperglycemia may include the following:
 - a. Increased thirst;
 - b. Frequent urination;
 - c. Sugar in the urine;
 - d. Fatigue;
 - e. Headache; and
 - f. Blurred vision.
2. Diabetic ketoacidosis (DKA) (diabetic coma). Ketoacidosis occurs when hyperglycemia is untreated and the cells begin to metabolize fat for energy. The byproduct of fat metabolism is ketones, which build up quickly in the blood. Diabetic ketoacidosis is a life-threatening emergency that needs immediate medical attention. Symptoms include:
 - a. High blood sugar;
 - b. Ketones in the urine;
 - c. Nausea and/or vomiting;
 - d. Weakness and fatigue;
 - e. Shortness of breath;
 - f. Sweet or fruity odor or breath;
 - g. Confusion; and/or
 - h. Coma.

Complications Associated with Diabetes

Complications associated with diabetes can be attributed to: (1) uncontrolled hyperglycemia and subsequent damage to the vasculature; (2) over treatment of diabetes resulting in hypoglycemia; or (3) common co-morbidities of diabetes.

1. Hyperglycemia and vascular damage can lead to:
 - a. cardiovascular and cerebrovascular disease, including heart disease and stroke;
 - b. cognitive impairment;
 - c. kidney disease;
 - d. glaucoma, cataracts, retinopathy, blindness;
 - e. nerve damage (diabetic neuropathy);
 - f. foot complications – neuropathy, dry skin, calluses, poor circulation, ulcers;
 - g. skin problems – fungal/bacterial infections, itching, diabetic dermopathy; and/or
 - h. gastroparesis (delayed stomach emptying).

continues on next page

2. Hypoglycemia can lead to:
 - a. cognitive impairment;
 - b. functional impairment;
 - c. falls;
 - d. fractures; and
 - e. pain.
3. Comorbidities associated with diabetes:
 - a. hypertension;
 - b. obesity;
 - c. autoimmune disease;
 - d. cognitive impairment;
 - e. poor nutrition;
 - f. sleep apnea; and
 - g. periodontal disease.
4. Older adults with diabetes are at higher risk for functional impairment, cognitive decline, pain, falls, depression, muscle loss and urinary incontinence than other older adults.
5. Screening for diabetes complications in older adults should concentrate on those most likely to cause or contribute to functional impairment.
6. Older adults with diabetes should be regularly screened for cognitive impairment. Cognitive decline is associated with increased risk of hypoglycemia, and severe hypoglycemia is linked to increased risk of dementia.¹

Glycemic Targets

1. Use a glucometer for capillary blood sampling to measure current blood glucose levels.
2. The target range for healthy older adults is considered 90-130 mg/dl (fasting or pre-prandial glucose).²
3. Glycemic targets for older adults with chronic illnesses, functional decline, or cognitive impairment may be less stringent. (See Table 12.1)
4. The provider will order the frequency of glucose monitoring and establish appropriate glycemic targets for individual residents.
5. Manage hypoglycemia according to protocols and provider orders (see *Management of Hypoglycemia*).
6. Establish provider notification protocols, for example:
 - a. Call provider immediately if resident is hypoglycemic (<70 mg/dL).
 - b. Call as soon as possible when:
 - (1) blood glucose values are regularly 70–100 mg/dL (for possible regimen adjustment);
 - (2) blood glucose values are >250 mg/dL more than once within a 24-hr period;
 - (3) blood glucose values are >300 mg/dL more than once over two consecutive days;
 - (4) reading is too high for glucometer; or
 - (5) the resident is vomiting, has symptomatic hyperglycemia or poor oral intake.

continues on next page

¹American Diabetes Association. 2020. Older Adults: Standards of Medical Care in Diabetes – 2020. *Diabetes Care* 43(S1): S153

²IBID: S155.

Blood Glucose Monitoring

Follow the provider orders for blood glucose monitoring. Examples for various situations may include:

1. For the resident on oral medication(s) who is well controlled, monitor blood glucose levels at least twice weekly (or more frequently if there is a change in drugs or drug dosages).
2. For the resident receiving oral medication(s) who is poorly controlled:
 - a. monitor blood glucose levels twice to four times daily as needed.
3. For the resident receiving insulin who is well controlled:
 - a. monitor blood glucose levels twice a day if on insulin (for example, before breakfast and lunch and as necessary);
 - b. monitor 3 to 4 times a day if on intensive insulin therapy or sliding-scale insulin; and/or
 - c. monitor as indicated if the individual is fasting before a medical procedure, has returned to the facility after a significant absence, or has an acute infection or illness.

Medication Management

1. Insulin is required for individuals with type I diabetes.
2. Insulin (injectable) can be administered via syringe, pump, or pen.
3. Medication management of type II diabetes may include oral hypoglycemic agents with or without insulin.
4. Follow the policies for *Self-Administration of Medications* and *Storage of Medications* for residents who are capable of self-monitoring blood glucose levels and self-administering insulin.
5. Closely monitor the diabetes management of cognitively impaired residents.
6. Assist the resident with his or her specific medication regimen, as ordered and as needed.

Nutritional Support

1. Support optimal nutrition and protein intake for diabetic residents.
2. Dietary restrictions for diabetic residents in long-term care are not recommended as the cornerstone of diabetes management.
3. Monitor the resident for nutritional problems and unintended weight loss and notify the health care provider if this appears to be related to any dietary restrictions.

Exercise Considerations

1. Exercise often helps to improve blood sugar control.
2. The extent of allowable activity levels for any resident is based on his/her overall functioning and well-being, co-morbidities, cardiovascular and respiratory status, musculoskeletal function, and blood glucose control.
3. The health care provider and associates, in conjunction with the resident/family, shall determine appropriate levels of activity for the resident and whether exercise is a suitable intervention for that resident.

Skin and Foot Care

1. Skin should be kept as dry and clean as possible.
 - a. Apply lotion to dry skin as needed, unless contraindicated.
2. Use aseptic technique in caring for any lacerations, abrasions or breaks in skin integrity, and report the condition immediately to your supervisor.

continues on next page

3. Bathe feet in warm (not hot) water as necessary to keep clean.
4. Keep feet dry, especially between toes.
5. Encourage the use of non-constricting, well-fitting shoes, slippers and hose.
6. Keep feet warm without the use of external heat sources (e.g., heating pads).
7. Toenails should only be trimmed by personnel qualified to do so (this can be regular associates, and does not have to be a podiatrist).
8. Care of corns and/or calluses should be referred to qualified individuals (which may require health care provider or podiatrist intervention).

Educational and Teaching Considerations

1. Attend diabetes in-service education and demonstrate competency before caring for a resident with diabetes.
2. Assess and document the resident's diabetes knowledge and ability to perform specific tasks of self-care.

Documentation

1. For residents with confirmed diabetes, the nurse shall assess and document/report the following during the initial assessment:
 - a. Resident's age and sex;
 - b. Level of consciousness, change in orientation;
 - c. Dose and time of most recent anti-hyperglycemic given;
 - d. All other current medications;
 - e. Any signs or symptoms of infection (urine, skin/wound, upper respiratory, etc.) or other acute illnesses;
 - f. Usual patterns of eating and drinking;
 - g. Approximate intake over last 24 hours;
 - h. Recent change in intake/thirst;
 - i. Resident's blood sugar history over 48 hours;
 - j. Usual patterns (fluctuations, trends) of blood sugar over recent months;
 - k. Onset, duration of any changes; and
 - l. Recent labs.

Obtaining a Fingertick Glucose Level

Level III

Purpose

The purpose of this procedure is to obtain a blood sample to determine the resident's blood glucose level.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.
4. Ensure that the equipment and devices are working properly by performing any calibrations or checks as instructed by the manufacturer or this facility.
5. Depending on the type of equipment used, a timer or watch with a second hand may be needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water (individual wash basin with soap and warm water for a non-ambulatory resident);
2. Wash cloth and towel;
3. Disinfected blood glucose meter (glucometer) with sterile lancet; *or* single-resident use spring-loaded device (e.g., Penlet) *or* automatic or safety type lancet;
4. 1-2 Cotton balls;
5. Reagent strip with color chart (e.g., Chemstrip) *or* blood glucose monitoring system (meter with test strips and calibration supplies);
6. Single use alcohol swab; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
2. If using the blood glucose monitoring system (blood glucose meter with test strips), use test strips before their expiration date. Do not use test strips that have been wet, bent or otherwise damaged.
3. Always ensure that blood glucose meters intended for reuse are cleaned and disinfected between resident uses. Single-resident use fingertick devices (pen-like devices) should never be used by more than one resident.
4. Encourage and assist the resident, as needed, to increase the blood flow to his or her fingers by brisk hand washing with warm water and soap, followed by thorough drying and resting his or her arms in a dependent position (i.e., arms relaxed at the sides of the body, below the heart level, etc.).
5. Wear clean gloves.
6. Assess the resident's fingertips for good blood supply. Choose a site on the lateral surface of the fingertip that does not have callous formation or bruising. Rotate sites when frequent punctures are to be performed.
7. Wash the selected fingertip, especially the side of the finger, with warm water and soap. (Note: If alcohol is used to clean the fingertip, allow it to dry completely because the alcohol may alter the reading. Repeated use of alcohol may toughen the skin.)

continues on next page

8. Obtain a blood sample by using a sterile lancet (a spring-loaded lancet or manual lancet). Discard the first drop of blood if alcohol is used to clean the fingertips because alcohol may alter the results.
9. If using an automatic or safety type lancet, use moderate pressure to hold the lancet against the side of the finger, depress the plunger and then release.
10. If a drop of blood is not present at the puncture site, hold the finger downward and gently massage the finger from the base to the puncture site. Do not squeeze or apply pressure to the site.
11. Place a drop of blood on the reagent strip, covering the test area completely.
12. Wipe the fingertip with a cotton ball to seal the puncture site.
13. If bleeding persists, apply a bandage.
14. Follow the instructions provided by the manufacturer of the glucose monitoring system to obtain a blood glucose reading. If the resident is experiencing symptoms that are not consistent with the blood glucose results obtained, contact the physician immediately.
15. Point the spring-loaded device down and away from the face and body and carefully remove the lancet.
16. Dispose of the lancet in the sharps disposal container.
17. Discard disposable supplies in the designated containers.
18. Clean and disinfect reusable equipment between uses according to the manufacturer's instructions and current infection control standards of practice.
19. Remove gloves and discard into designated container.
20. Wash hands.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The blood sugar results. Follow facility policies and procedures for appropriate nursing interventions regarding blood sugar results (if resident is on sliding scale coverage, and/or physician intervention is needed to adjust insulin or oral medication dosages), etc.
7. The signature and title of the person recording the data.

Reporting

1. Report results promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Defibrillation Event Report

Seizures and Epilepsy – Clinical Protocol

Assessment and Recognition

1. The physician and staff will help identify individuals who have a history of seizure or epilepsy, and individuals who are receiving antiepileptic medications for any reason; for example, seizure prophylaxis after a recent stroke or treatment for behavioral symptoms related to dementia.
 - a. Seizures and epilepsy are not identical, as seizures may occur in individuals without epilepsy.
 - b. Acute seizures may occur in relation to a metabolic disturbance (for example, hypoglycemia, hyponatremia, or hypocalcemia) or an acute central nervous system (CNS) illness such as a stroke or head injury. Epilepsy refers to repeated, unprovoked seizures.
2. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Neurological assessment;
 - c. Change in level of consciousness;
 - d. Any seizure activity in detail (location, duration, severity, recurrence, etc.);
 - e. Injury occurring with seizure;
 - f. Resident's age and sex;
 - g. Whether resident has a known seizure disorder or history of actual seizure activity;
 - h. Date of most recent actual seizure activity, if occurred;
 - i. How current seizure activity relates to usual patterns; and
 - j. Last blood level of any anticonvulsants being given.
3. The staff will identify and report individuals who may be having a seizure.
 - a. Examples of signs and symptoms include sudden onset of confusion, aura, visual or auditory hallucinations, difficulty speaking or understanding speech, severe dizziness, loss of consciousness, loss of balance or coordination; sudden numbness, tingling, or weakness of the face or in an arm or leg; or sudden headache, without another identifiable cause. Generalized tonic/clonic activity may or may not be present.
 - b. Staff should carefully describe signs and symptoms including the resident's vital signs, current level of consciousness, cognitive ability, speech, physical function, abnormal motor activity, tremors, overall physical condition, and a comparison of the resident's current status to his/her usual (baseline) level of cognition and physical function. They should not just document or report that the individual is "having a seizure" (which is a diagnosis, not a description).
 - c. The physician should help the staff distinguish seizure activity from other abnormal movements (for example, myoclonus) and reasons for change in mental status or level of consciousness.
4. If a new or recurrent seizure is identified or suspected, the physician will evaluate the need to transfer the individual to a hospital for additional evaluation and treatment.
 - a. Hospital transfer may not be necessary if the individual has a known seizure disorder or if the diagnosis is apparent, the seizure can be readily controlled, vital signs are stable, major complications are not present, it is possible to obtain diagnostic tests to rule out other causes, or if hospital transfer is contrary to the wishes of the resident or substitute decision-maker as identified through an advance directive or other care instructions.

continues on next page

Cause Identification

1. For someone with a new or recurrent seizure who is not to be hospitalized, the physician will obtain information and order tests (as needed) to help confirm the diagnosis, rule out other causes of symptoms, (e.g., transient ischemic attack due to cardiovascular problems), seek to identify causes of the seizure, and identify the nature and severity of any complications.
 - a. For example, seizures may be caused by central nervous system (CNS) and systemic infections (for example, pneumonia, meningitis, and sepsis), metabolic disorders (for example, hyponatremia, uremia, and hypocalcemia); abrupt discontinuation of antipsychotics, sedatives, anxiolytics, barbiturates, benzodiazepines, and other medications; or medications that can lower the seizure threshold or precipitate seizures (for example, theophylline, antipsychotic medications, tricyclic antidepressants, opioid analgesics, and some antibiotics); and primary or metastatic CNS cancer.
 - b. Depending on clinical evidence, examples of potentially relevant tests may include serum creatinine, BUN, electrolytes, glucose, urinalysis, complete blood count (CBC), and platelets; brain CT or MRI scan, echocardiogram, electrocardiogram, liver function tests, toxicology screen, lumbar puncture, serum ammonia, blood alcohol level, or blood levels of current medications.

Treatment/Management

1. The physician will treat underlying causes and risk factors, where possible; for example, correct sodium or calcium imbalances, or taper, stop, or change medications associated with an increased seizure risk.
2. The physician will identify and order appropriate treatment for an acute seizure and a seizure disorder.
 - a. Antiepileptic medications should be instituted if there is a reasonable chance that seizures will recur, but may not be necessary if a single seizure with an identified cause (for example, hyponatremia or an adverse drug reaction) does not indicate an underlying tendency toward recurrent seizures. The physician will explain and/or document when an antiepileptic medication is not indicated.
 - b. The physician will select antiepileptic medications based on the category of seizure, existing medication regimen, other risk factors, and (where feasible) discussion with the resident about acceptable level of risk for recurrent seizures.
 - c. Antiepileptic medications should be used in the lowest possible dose, consistent with seizure control. Most antiepileptic medications have prominent side effects, including lethargy, dizziness, and ataxia.

Monitoring

1. The staff and physician will monitor the progress of individuals with a new seizure or a seizure disorder, and will modify interventions accordingly.
 - a. They should document periodically and objectively the presence or absence of seizure activity.
2. The physician will monitor antiepileptic medication blood levels periodically, where applicable.
 - a. Not all antiepileptic medications have identifiable ranges of therapeutic concentrations. Laboratory ranges for “therapeutic” levels are not universally applicable; some individuals may have seizures with a “therapeutic” level of medication, while others may have good seizure control, toxicity, or significant side effects with a “therapeutic” or “low” blood level. “Low” blood levels do not by themselves indicate the need to increase medication doses or add medications.
 - b. Additional doses of antiepileptic medications should ordinarily not be ordered based on blood levels alone, especially in a seizure-free individual. This may cause additional side effects or toxicity without improving seizure control.

continues on next page

- c. The physician should document why additional doses may not be needed to address “low” blood levels.
3. The staff and physician will monitor for complications related to antiepileptic medications; for example, dizziness, ataxia, somnolence, headache, diplopia, blurred vision, nausea, vomiting, and rash.
 - a. The staff, consultant pharmacist, and physician will also monitor for drug interactions between antiepileptic medications and other categories of medications; for example, phenytoin and amiodarone, salicylates, warfarin, and trazodone.
4. If seizures are complex, not readily responsive to medication dosage adjustments, or persist despite treatment with up to three antiepileptic medications, the physician should consider a referral to a neurologist.
5. For individuals who have been seizure-free for an extended time, the physician will periodically consider tapering antiepileptic medications especially when their initial use was for idiopathic seizures, an underlying acute medical cause was corrected, or seizure prophylaxis had been initiated in the absence of an identifiable structural cortical lesion.
 - a. The physician will document clinically valid reasons for maintaining a current dose without attempting any reduction.

Automatic External Defibrillator, Use and Care of

Policy Statement

Personnel have completed training on the initiation of cardiopulmonary resuscitation (CPR) and basic life support (BLS), including defibrillation, for victims of sudden cardiac arrest.

Policy Interpretation and Implementation

1. During a sudden cardiac arrest event, follow guidelines outlined in the procedure for *Cardiopulmonary Resuscitation and Basic Life Support*.
2. If an individual (resident, visitor, or staff member) is found unresponsive and not breathing normally, a licensed staff member who is certified in CPR/BLS shall initiate CPR immediately unless:
 - a. it is known that a Do Not Resuscitate (DNR) order that specifically prohibits CPR and/or external defibrillation exists for that individual; or
 - b. there are obvious signs of irreversible death (e.g., rigor mortis).
3. The automatic external defibrillator (AED) will be used to try to restore normal cardiac rhythm when arrhythmia is strongly suspected. Recognizing the signs and symptoms of arrhythmia (and when to use the AED) is part of the CPR/BLS training.
4. In general, SCA should be suspected if:
 - a. the victim's symptoms appeared very suddenly;
 - b. he or she is unresponsive; and
 - c. his or her breathing has stopped.
5. If an individual is found unconscious and SCA is suspected, begin the AED Protocol below.

Initial Assessment and Safety Precautions

1. Call (or direct someone to call) 911.
2. Apply personal protective equipment.
3. Assess the victim:
 - a. Responsiveness – if unresponsive, retrieve (or direct someone to retrieve) the AED from its location and bring it to the victim.
 - b. Breathing – open airway and look, listen, feel for breathing. If breathing is absent, deliver two rescue breaths.
 - c. Circulation – if signs of circulation are absent, begin CPR until the AED is available.
4. Remove any flammable gases (e.g., oxygen) from the immediate environment.

continues on next page

Device Setup

1. Remove the device from its case.
2. Check the battery cartridge to ensure it is in place.
3. Remove the film seal from pads.
4. Turn on the device and follow the prompts.

Applying Pads to the Victim

1. Remove clothing from the victim's chest.
2. Wipe chest dry (do not use alcohol wipes).
3. Remove any patches or adhesives from the chest.
4. Shave hair from the chest if necessary.
5. Check the adhesive on pads to make sure they are sticky. If not, replace the pads.
6. Attach two AED pads to the victim's bare chest (one on the upper right, one on the left).
 - a. Apply away from any metal that is already in contact with the victim.
 - b. Avoid applying over an existing implanted pacemaker or defibrillator.
7. Plug in the connector.

Defibrillation

1. After applying pads and during initial setup, keep the victim still and do not touch him or her. The AED will analyze the heart rhythm and indicate whether a shock is needed. Movement or noise may interfere with the analysis.
2. If a shock is indicated, make sure no one is touching the victim when administering the shock.
3. Administer additional shocks as prompted by the AED.
4. After delivering shocks (if signs of circulation are still absent) administer CPR for approximately 2 minutes.
5. Follow the AED prompts until the emergency medical service arrives.

EMS Arrival

1. Communicate the following information to EMS personnel:
 - a. Name of the victim;
 - b. Any known medical history, allergies or conditions;
 - c. The condition in which the victim was found;
 - d. Time the victim was found;
 - e. Number of shocks delivered; and
 - f. Approximate length of CPR administration.
2. Assist EMS as requested.

continues on next page

Storing the AED

1. Replace used accessories, including pads.
2. Clean and inspect the device.
3. If the device has internal memory, download any data according to device instructions and clear memory.
4. Store the AED in its original case. Do not put anything in the case other than the original equipment, instructions, backup battery and spare pads.
5. Keep the instructions in a place that makes them visible upon opening the case.
6. Follow all other manufacturer guidelines for proper storage.
7. Keep the device in a high-traffic, visible location.

Maintaining the AED

1. Keep a spare battery and adhesive pads in the case, as instructed. Record the expiration date of the battery and the pads on the maintenance log or tag.
2. Check the device and perform maintenance tasks, as directed.
3. Document checks, maintenance steps and date performed on maintenance log and store log with the device.

Documentation

1. Complete a defibrillation event report within 24 hours of the event.
2. If the victim is a resident of the facility, document details of the event in the resident’s medical record.

Do Not Resuscitate Order

Policy Statement

Our facility will not use cardiopulmonary resuscitation and related emergency measures to maintain life functions on a resident when there is a *Do Not Resuscitate Order* in effect.

Policy Interpretation and Implementation

1. Do not resuscitate orders must be signed by the resident's attending physician on the physician's order sheet maintained in the resident's medical record.
2. A *Do Not Resuscitate (DNR)* order form must be completed and signed by the attending physician and resident (or resident's legal surrogate, as permitted by State law) and placed in the front of the resident's medical record.
 - a. Use only State-approved DNR forms.
 - b. If no State form is required, use facility-approved form.
3. In addition to the advance directive and DNR order form, state-specific forms may be used to specify whether to administer CPR in case of a medical emergency. State-specific forms include:
 - a. Physician Orders for Life-Sustaining Treatment (POLST);
 - b. Physician Orders for Scope of Treatment (POST);
 - c. Medical Orders for Life-Sustaining Treatment (MOLST);
 - d. Medical Orders for Scope of Treatment (MOST);
 - e. Clinicians Orders for Life Sustaining Treatment (COLST); and
 - f. Transportable Physician Orders for Patient Preference (TPOPP).
4. Should the resident be transferred to the hospital, a photocopy of the DNR order form must be provided to the personnel transporting the resident to the hospital.
5. Do not resuscitate (DNR) orders will remain in effect until the resident (or legal surrogate) provides the facility with a signed and dated request to end the DNR order.
 - a. Verbal orders to cease the DNR will be permitted when two (2) staff members witness such request.
 - b. Both witnesses must have heard the request and both individuals must document such information on the physician's order sheet.
 - c. The attending physician must be informed of the resident's request to cease the DNR order.
6. The interdisciplinary care planning team will review advance directives with the resident during quarterly care planning sessions to determine if the resident wishes to make changes in such directives.
7. The resident's attending physician will clarify and present any relevant medical issues and decisions to the resident or legal representative as the resident's condition changes in an effort to clarify and adhere to the resident's wishes.

continues on next page

8. Inquiries concerning do not resuscitate orders/requests should be referred to the administrator, director of nursing services, or to the social services director.

Emergency Dental Care

Policy Statement

Emergency dental care is available to all residents of this facility.

Policy Interpretation and Implementation

1. Emergency dental care is available on a twenty-four (24) hour basis.
2. Should a resident need emergency dental care, the dental consultant shall be notified so that arrangements for the emergency care can be made.
3. Social services shall contact the consultant dentist to set up the appointment. (Note: Should social services be unavailable, the charge nurse shall contact the consultant dentist.)
4. Emergency dental services include services needed to treat an episode of acute pain in teeth, gums, or palate; broken, or otherwise damaged teeth, or any problem of the oral cavity appropriately treated by a dentist that requires immediate attention.

Emergency Physician Care

Policy Statement

Emergency physician care is available to all residents when their attending physicians are unavailable.

Policy Interpretation and Implementation

1. Emergency physician care is available to all residents on a twenty-four (24) hour basis.
2. Should the resident's attending physician be unavailable, the nurse supervisor/charge nurse must first attempt to contact the physician's designated referral physician or practitioner.
3. Should the designated referral physician be unavailable to assist in the emergency, the on-call physician or medical director shall be contacted.
4. A listing of on-call physicians, their phone numbers, and the day that each is on call is posted at each nurses' station.

First Aid Treatment

Policy Statement

Residents and employees who experience minor injuries shall be treated at the facility. If the injuries cannot be treated with basic Red Cross first aid intervention, the emergency medical system (EMS) will be activated.

Policy Interpretation and Implementation

1. As part of the initial orientation and training, all licensed staff will complete an American Red Cross basic life support and first aid training course (or similar program that has been approved by the quality assurance and performance improvement committee).
 - a. Instructor-led, “hands-on” training will occur initially upon hire and periodically thereafter. Skills for basic first aid shall be reviewed as needed.
 - b. Training shall be up to date with current first aid techniques and knowledge.
 - c. Training and reference materials shall be replaced as necessary.
2. The goal of staff training is to enable employees to provide basic life support and/or first aid intervention to injured residents or employees. In the case of life-threatening injuries or situations, the goal is patient stabilization until the EMS arrives.
3. Basic first aid intervention includes (but is not limited to) interventions for the following situations:
 - a. Choking, breathing emergencies;
 - b. Burns (chemical, heat, electrical);
 - c. Cuts, lacerations;
 - d. Bleeding (mild and moderate);
 - e. Shock;
 - f. Joint, bone and musculoskeletal injuries;
 - g. Allergic reactions and anaphylaxis; and/or
 - h. Bites and stings.
4. The goal of emergency intervention is to stabilize the resident and the situation until further treatment is available.
5. In addition to providing basic first aid intervention, contact the emergency medical system (EMS) or advanced medical personnel immediately for the following situations:
 - a. Unconsciousness or altered consciousness;
 - b. Difficulty or absence of breathing;
 - c. Chest pain;
 - d. Persistent abdominal pain or pressure;
 - e. Severe bleeding;
 - f. Vomiting blood or blood in stool;
 - g. Severe burns;
 - h. Suspected poisoning;
 - i. Seizures;
 - j. Suspected stroke (sudden unilateral weakness, slurred speech or severe headache);

continues on next page

- k. Suspected head, neck or spine injury;
 - l. Suspected broken bone or open fracture; or
 - m. Condition is not clear or is worsening.
6. Procedures for basic first aid intervention are located in the facility first aid manual/guide book. A copy of this manual is kept at each nurse's station with the first aid kit.
 7. A first aid kit shall be maintained at each nurse's station for use in treating minor injuries. Each kit contains, as a minimum, the following supplies:
 - a. Assorted bandages (50-75);
 - b. Fingertip fabric bandages (10);
 - c. Knuckle fabric bandages (10);
 - d. 2" x 2" gauze pads (5) – packs of 2;
 - e. 3" x 3" gauze pads (5) – packs of 2;
 - f. 2" gauze roll bandage (1) – 2" roll;
 - g. 3" gauze roll bandage (1) – 3" roll;
 - h. Elastic wrap bandage (1) – 2" x 5 yd. bandage;
 - i. Triangular sling/bandage (1);
 - j. 5" x 9" trauma pad (1);
 - k. Butterfly wound closure bandages (10);
 - l. Alcohol cleansing pads (20);
 - m. Antiseptic cleansing wipes (10);
 - n. First aid/burn cream packs (10);
 - o. First aid antibiotic ointment packs (10);
 - p. Burn relief gel 3.5 gm. packs (6);
 - q. Eye wash 1 oz. bottle (1);
 - r. Castile soap towelettes (10);
 - s. Moleskin – 2" square (10);
 - t. CPR face shield and vinyl gloves (1) shield, (1) pair gloves;
 - u. Vinyl gloves (2) pairs;
 - v. First aid tape (1) – 1/2" x 10 yd. roll;
 - w. Cloth first aid tape (1) – 1" x 5 yd. roll;
 - x. Bandage protectant/finger cot (50);
 - y. Nickel plated scissors (1) 4-1/2" scissor;
 - z. Stainless steel tweezers, slanted (1) 3"; and
 - aa. First aid guide (1) guidebook.
 8. The director of nursing services, or his/her designee, shall be responsible for ensuring that first aid kits are inspected quarterly and that adequate supplies are on-hand at all times.
 9. First aid kits may not be removed from their assigned locations except for treatment of the injured, drill exercises, and/or the replenishment of supplies.
 10. Emergency first aid treatment will be provided to injured residents and employees. However, residents and employees have the right to refuse such medical treatment. Such information must be recorded in the resident's medical record or the employee's personnel file. For residents who refuse the treatment, the charge nurse and attending physician shall be notified of the refusal.

continues on next page

11. Regardless of the nature or severity, any resident's injury/situation shall be reported to the resident's attending physician and family, and documented in the resident's medical record. If the resident's attending physician is not available, follow the facility policy for *Emergency Physician Care*.
12. An injured employee may seek medical attention from his/her personal physician, the facility's medical director, or from a medical treatment center.
13. Regardless of the nature or severity of an employee's injury, all on-the-job injuries must be reported to the employee's department director or supervisor.

Emergency Procedure – Cardiopulmonary Resuscitation

Policy Statement

Personnel have completed training on the initiation of cardiopulmonary resuscitation (CPR) and basic life support (BLS), including defibrillation, for victims of sudden cardiac arrest.

General Guidelines

1. Sudden cardiac arrest is a loss of heart function due to abnormal heart rhythms (arrhythmias). Cardiac arrest occurs soon after symptoms appear. It is a leading cause of death among adults.
2. A “heart attack” refers to impaired blood flow to the heart which leads to damage of the heart muscle. A heart attack can cause sudden cardiac arrest. Typically heart attacks are less sudden than SCA.
3. Victims of cardiac arrest may initially have gasping respirations or may appear to be having a seizure. Training in BLS includes recognizing presentations of SCA.
4. The chances of surviving SCA may be increased if CPR is initiated immediately upon collapse.
5. Early delivery of a shock with a defibrillator plus CPR within 3-5 minutes of collapse can further increase chances of survival.
6. If an individual (resident, visitor, or staff member) is found unresponsive and not breathing normally, a licensed staff member who is certified in CPR/BLS shall initiate CPR unless:
 - a. it is known that a Do Not Resuscitate (DNR) order that specifically prohibits CPR and/or external defibrillation exists for that individual; or
 - b. there are obvious signs of irreversible death (e.g., rigor mortis).
7. If the resident’s DNR status is unclear, CPR will be initiated until it is determined that there is a DNR or a physician’s order not to administer CPR.
8. If the first responder is not CPR-certified, that person will call 911 and follow the 911 operator’s instructions until a CPR-certified staff member arrives.

Preparation for Cardiopulmonary Resuscitation

1. Obtain and/or maintain American Red Cross or American Heart Association certification in Basic Life Support (BLS)/Cardiopulmonary Resuscitation (CPR) for key clinical staff members who will direct resuscitative efforts, including non-licensed personnel.
2. The facility’s procedure for administering CPR shall incorporate the steps covered in the 2010 *American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care* or facility BLS training material.
3. Provide periodic Mock Codes (simulations of an actual cardiac arrest) for training purposes.
4. Select and identify a CPR Team for each shift in the case of an actual cardiac arrest. To the extent possible, designate a team leader on each shift who is responsible for coordinating the rescue effort and directing other team members during the rescue effort.

continues on next page

5. The CPR Team in this facility shall include at least one nurse, one LPN/LVN and two CNAs, all of whom have received training and certification in CPR/BLS.
6. Maintain equipment and supplies necessary for CPR/BLS in the facility at all times.
7. Provide information on CPR/BLS policies and advance directives to each resident/representative upon admission.

Emergency Procedure – Cardiopulmonary Resuscitation

1. If an individual is found unresponsive, briefly assess for abnormal or absence of breathing. If sudden cardiac arrest is likely, begin CPR:
 - a. Instruct a staff member to activate the emergency response system (code) and call 911.
 - b. Instruct a staff member to retrieve the automatic external defibrillator.
 - c. Verify or instruct a staff member to verify the DNR or code status of the individual.
 - d. Initiate the basic life support (BLS) sequence of events.
2. The BLS sequence of events is referred to as “**C-A-B**” (**chest compressions, airway, breathing**).
3. **Chest compressions:**
 - a. Following initial assessment, begin CPR with chest compressions;
 - b. Push hard to a depth of at least 2 inches (5 cm) at a rate of at least 100 compressions per minute;
 - c. Allow full chest recoil after each compression; and
 - d. Minimize interruptions in chest compressions.
4. **Airway:** Tilt head back and lift chin to clear airway.
5. **Breathing:** After 30 chest compressions provide 2 breaths via ambu bag or manually (with CPR shield).
6. All rescuers, trained or not, should provide chest compressions to victims of cardiac arrest. Trained rescuers should also provide ventilations with a compression-ventilation ratio of 30:2.
7. When the AED arrives, assess for need and follow AED protocol as indicated.
8. Continue with CPR/BLS until emergency medical personnel arrive.

Emergency Procedure – Choking

Policy Statement

Trained staff will assist the resident who is choking by attempting to expel the foreign body from the airway.

Emergency Procedure - Choking

Conscious Resident—Standing or Sitting

1. Ask the resident if he or she is choking. Remember, a choking victim cannot speak or breathe and needs your help immediately.
2. Ask the resident to cough or speak if at all possible to determine if his or her airway is obstructed.
3. If able to cough, instruct and encourage the resident to continue coughing to dislodge or expel any foreign object.
4. Call for help, but stay with the resident.
5. Quickly assure the resident that you are going to stay and assist him or her.
6. If the resident cannot cough, only then should abdominal thrusts be performed as follows:
 - a. Stand behind the resident.
 - b. Wrap your arms around the resident's waist.
 - c. Make a fist with one hand.
 - d. Place the thumb side of your fist against the resident's upper mid-abdomen, below the ribcage and above the navel.
 - e. Grasp your clenched fist with your other hand.
 - f. Press your fist into the resident's upper abdomen with a quick upward thrust.
 - g. Do not squeeze the ribcage. Contain the force of the thrust to your hands.
 - h. Repeat the thrusts until the foreign body is expelled or the resident loses consciousness.

Unconscious Resident—Lying Down (or When Unable to Reach Around the Resident)

1. Ease the resident as gently as possible to the floor.
2. Call for help if assistance is not already present but do not leave the resident unattended.
3. Position the resident on his or her back with the arms at his or her side.
4. Perform abdominal thrusts as follows:
 - a. Facing the resident, kneel down and straddle the resident's upper thighs with your body.
 - b. Place the heel of one hand on the resident's upper mid-abdomen, below the rib cage and above the navel and with fingers pointed toward the resident's chest.
 - c. Place the other hand directly over the positioned hand.
 - d. Bring your shoulders forward over your hands.
 - e. Use your body weight to press your hands into the resident's upper abdomen with a quick upward thrust.
5. Perform the finger sweep maneuver to check for a foreign body as follows:
 - a. Keep the resident's face up.

continues on next page

- b. Perform the tongue-jaw lift to open the resident's mouth. (Note: Moving the lower jaw moves the tongue off the throat and opens the airway.)
- c. Perform the finger sweep using your index finger as a hook.
 - (1) Insert your index finger into the resident's mouth along side of the cheek and across the base of the tongue.
 - (2) Try to remove any foreign objects.
 - (3) Avoid pushing foreign objects deeper into the throat.
 - (4) Turn the resident's head to one side if needed to sweep an object from the mouth.
6. Alternate steps four (4) and five (5) until the object is expelled. Arrange for the resident to be evaluated by a physician immediately after the foreign body airway obstruction has been removed.
7. If unable to clear the foreign body from obstructing the airway, arrange emergency transport of the resident to the nearest acute care medical facility.
8. Proceed with CPR immediately if the resident has no pulse or respirations.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The exact time the choking began.
4. The exact time of any unconsciousness.
5. All assessment data obtained during the procedure.
6. The time the procedure was started and stopped.
7. The resident's response to the procedure.
8. The signature and title of the person recording the data.

Reporting

1. Report results promptly to the supervisor and the attending physician.
2. Notify the resident's personal physician of all assessment data, observations and results.
3. Report other information in accordance with facility policy and professional standards of practice.

Emergency Procedure – Seizure Management

Policy Statement

Personnel will assist in safety measures for a resident who is having a seizure.

General Guidelines

1. A generalized tonic/clonic (grand mal) seizure usually lasts 2-5 minutes and is characterized by one or more of the following:
 - a. Crying out;
 - b. Loss of consciousness;
 - c. Convulsive activity;
 - d. Incontinence; and/or
 - e. Postictal phase (sleepiness, confusion, amnesia).
2. Seizures may occur without convulsions (rigidity and jerking movements). Other symptoms of seizure activity may include:
 - a. Sudden onset of confusion;
 - b. Aura (sometimes a smell, taste or bright light);
 - c. Visual or auditory hallucinations;
 - d. Difficulty speaking or understanding speech;
 - e. Severe dizziness;
 - f. Loss of consciousness;
 - g. Loss of balance or coordination;
 - h. Sudden numbness, tingling, or weakness of the face or in an arm or leg; and/or
 - i. Sudden headache, without another identifiable cause.

Preparation for Managing Residents with Seizure History

1. During the initial assessment, screen residents for a history of seizures or conditions that place the resident at risk for seizures.
2. For residents with identified risk of seizures, review the resident's history and note any situations or conditions that precipitate seizures.
3. Obtain and have on hand equipment and supplies, including suction equipment and artificial airway, to help manage an active seizure.

Emergency Procedure - Seizure Management

1. Have at least one person stay with the resident, while having another staff member get needed equipment and notify an RN or LPN.
2. If convulsions are tonic/clonic (grand mal), monitor the airway and take steps as needed to maintain an open airway.
3. If the resident is having a seizure while standing, try to guide the resident to the floor and protect his/her head.

continues on next page

4. If the resident is having a seizure while in bed, take measures to prevent the resident from falling out of bed and do not leave the resident unattended.
5. As much as possible, remove loose objects near the resident.
6. If possible, turn the resident on his/her side.
7. Tilt the head forward (i.e., chin towards the chest).
8. Loosen clothing.
9. Do not attempt to place objects in the resident's mouth.
10. Do not attempt to restrain the resident.
11. Note the time and duration of the seizure activity.
12. When the episode is over, tell the resident what happened.
13. If the tonic/clonic convulsions last longer than 5 minutes, or are followed by subsequent seizures, this may constitute status epilepticus, which is a medical emergency. If this is suspected, notify the physician. If the physician is not immediately available to discuss the situation, initiate emergency transfer.
14. Monitor the resident's vital signs every 15 minutes for at least two hours following seizure activity, and then as ordered by the physician.
15. Notify the physician during or as soon as possible after the seizure, and notify the family of the event subsequently.

Documentation

Document the seizure, per facility protocol, in the medical record.

Palliative/End-of-Life Care – Clinical Protocol

Assessment and Recognition

1. Upon admission, the attending physician will help identify the prognosis for each resident.
2. The physician and staff will identify individuals who desire or are likely candidates for palliative care; for example, those with a known terminal illness or end-stage condition (that is, a condition that has resulted in substantial functional dependency, impairment and/or medical instability and continued decline anticipated, regardless of whether medical treatments are rendered).
3. The physician will review the resident's decision-making capacity and support the resident's participation in the care plan to the extent possible.
4. The interdisciplinary assessment of the resident and the family is the basis of the individualized care plan. The assessment will include at least:
 - a. Documentation of disease status, including diagnosis and prognosis;
 - b. Documentation of co-morbid medical and/or psychiatric conditions;
 - c. Functional status;
 - d. Strengths;
 - e. Concerns, goals and values of the resident and family;
 - f. Preferences and documentation for end of life decisions and care; and
 - g. Appropriateness of hospice referral.
5. The comprehensive assessment will recur on a regular basis and in response to significant changes of condition, or a change in resident and family goals and wishes.

Cause Identification

1. The physician will help identify or verify underlying causes of a resident's decline or end-stage or terminal status, including causes of complications such as anorexia or lethargy. Palliative care focuses on physical, psychological, social and spiritual quality of life for the resident and family. It is not uncommon for patients to have a potentially treatable condition or have potential for improved function and quality of life that has not been identified or treated adequately.

Treatment/Management

1. The physician will order appropriate interventions for symptom relief, including pain management.
2. To the extent possible, the physician will advise the resident/patient, family, and facility staff about the prognosis and overall medical plan periodically, including any impact of significant changes of condition.
3. The physician will order a hospice evaluation if indicated; for example, rapid progression of an end-stage condition or based on resident/patient or family request.
4. If hospice becomes involved, both the attending physician and staff will retain an active role in the resident/patient's care and will not simply defer everything to the hospice staff and practitioner.

continues on next page

Monitoring

1. The physician and staff will assess the resident's course, identify complications or additional decline, and adjust approaches accordingly.
2. The physician will help update the staff, resident/patient and family about the medical situation and will continue to integrate the medical approaches with the overall plan of care.
3. The staff and physician will guide and support the family after the resident/patient's death, as indicated.

Autopsy Requests

Policy Statement

Requests for autopsies must be submitted to the administrator in writing and must be in accordance with current state statutes governing autopsy consents.

Policy Interpretation and Implementation

1. Request for an autopsy must be submitted to the administrator.
2. An autopsy requested by the family must be accompanied by a written consent signed by the resident's representative.
3. The autopsy consent must be in compliance with current state statutes governing the performance of an autopsy.
4. The administrator shall seek legal counsel should he/she have reason to believe a fraudulent consent has been obtained.
5. Should the resident's advance directive indicate that no autopsy is to be performed the entity/individual requesting the autopsy will be informed of such directive.
6. If the autopsy is required by law the coroner or medical examiner may perform the autopsy without the consent of the family or representative.
7. When an autopsy is to be performed, the nurse supervisor/charge nurse releasing the body shall inform the mortician that an autopsy is to be performed. Such an entry will be made in the resident's clinical record.
8. The cost of autopsies performed at the request of the family will be billed to the family.

Death of a Resident, Documenting

Policy Statement

Appropriate documentation shall be made in the clinical record concerning the death of a resident.

Policy Interpretation and Implementation

1. A resident may be declared dead by a licensed physician or registered nurse with physician authorization in accordance with state law.
2. All information pertaining to a resident’s death (i.e., date, time of death, the name and title of the individual pronouncing the resident dead, etc.) must be recorded on the nurses’ notes.
3. The attending physician must record the cause of death in the progress notes, and must complete and file a death certificate with the appropriate agency within twenty-four (24) hours of the resident’s death or as may be prescribed by state law.
4. The nurse supervisor/charge nurse will inform the resident’s family of the resident’s death.
5. Nursing services will be responsible for preparing the deceased resident for discharge.
6. The nurse supervisor/charge nurse must notify the mortician, as identified in the resident’s medical record, to pick up the deceased resident.
 - a. Inform the mortician if the deceased resident was on isolation precautions or if an autopsy is to be performed.
 - b. Other than the information supplied on the death certificate, do not release details concerning the resident’s diagnosis or specific infectious agent without consent from the resident’s representative or as indicated in the resident’s advance directive.
7. The name of the mortician and person removing the deceased resident must be entered in the resident’s medical record.
8. The person removing the deceased resident from the facility must sign the release for the body, and the release must be filed in the resident’s medical record.
9. All records must be completed and forwarded to medical records for disposition.

Hospice Program

Policy Statement

Hospice services are available to residents at the end of life.

Policy Interpretation and Implementation

1. Our facility has an agreement in place with at least one Medicare-certified hospice to ensure that residents who wish to participate in a hospice program may do so.
2. In order for a resident to qualify for the hospice benefit under Medicare, he or she must be:
 - a. entitled to Medicare Part A; and
 - b. certified as being terminally ill in accordance with §418.22.
3. Residents who are not eligible for Medicare hospice services may elect to receive hospice services with contracted providers and pay for these services privately.
4. Upon admission and periodically during their stay, residents are informed of the availability of hospice services coordinated through the facility.
5. Hospice providers who contract with this facility:
 - a. must have a written agreement with the facility outlining (in detail) the responsibilities of the facility and the hospice agency; and
 - b. are held responsible for meeting the same professional standards and timeliness of service as any contracted individual or agency associated with the facility.
6. The agreement with the hospice provider will be signed by the facility representative and a representative from the hospice agency before hospice services are furnished to any resident.
7. A copy of the agreement is available through the facility business office and the hospice agency.
8. When a resident has been diagnosed as terminally ill, the director of nursing services will contact the hospice agency and request that a visit/interview with the resident/family be conducted to determine the resident's wishes relative to participation in the hospice program.
9. In general, it is the **responsibility of the hospice** to manage the resident's care as it relates to the terminal illness and related conditions, including the following:
 - a. Determining the appropriate hospice plan of care;
 - b. Changing the level of services provided when it is deemed appropriate;
 - c. Providing medical direction, nursing and clinical management of the terminal illness;
 - d. Providing spiritual, bereavement and/or psychosocial counseling and social services as needed; and
 - e. Providing medical supplies, durable medical equipment, and medications necessary for the palliation of pain and symptoms.

continues on next page

10. In general, it is the **responsibility of the facility** to meet the resident's personal care and nursing needs in coordination with the hospice representative, and ensure that the level of care provided is appropriately based on the individual resident's needs. These responsibilities include the following:
 - a. Twenty-four hour room and board care;
 - b. Administering prescribed therapies, including those therapies determined appropriate by the hospice and delineated in the hospice plan of care;
 - c. Notifying the hospice about the following:
 - (1) A significant change in the resident's physical, mental, social, or emotional status.
 - (2) Clinical complications that suggest a need to alter the plan of care.
 - (3) A need to transfer the resident from the facility for any condition.
 - (4) The resident's death.
 - d. Communicating with the hospice provider (and documenting such communication) to ensure that the needs of the resident are addressed and met 24 hours per day; and
 - e. Reporting any alleged violations involving mistreatment, neglect, or verbal, mental, sexual, and physical abuse, including injuries of unknown source, and misappropriation of resident property by hospice personnel, to the hospice administrator immediately upon awareness of the alleged violation.
11. The resident may choose to specify his or her attending physician, or another physician/practitioner, as the hospice attending physician.
12. Our facility has designated _____ (Name) _____ (Title) to coordinate care provided to the resident by our facility staff and the hospice staff. (Note: this individual is a member of the IDT with clinical and assessment skills who is operating within the state scope of practice act). He or she is responsible for the following:
 - a. Collaborating with hospice representatives and coordinating facility staff participation in the hospice care planning process for residents receiving these services;
 - b. Communicating with hospice representatives and other healthcare providers participating in the provision of care for the terminal illness, related conditions, and other conditions, to ensure quality of care for the resident and family;
 - c. Ensuring that the LTC facility communicates with the hospice medical director, the resident's attending physician, and other practitioners participating in the provision of care to the resident as needed to coordinate the hospice care with the medical care provided by other physicians;
 - d. Obtaining the following information from the hospice:
 - (1) The most recent hospice plan of care specific to each resident;
 - (2) Hospice election form;
 - (3) Physician certification and recertification of the terminal illness specific to each resident;
 - (4) Names and contact information for hospice personnel involved in hospice care of each resident;
 - (5) Instructions on how to access the hospice's 24-hour on-call system;
 - (6) Hospice medication information specific to each resident; and
 - (7) Hospice physician and attending physician (if any) orders specific to each resident.
 - e. Ensuring that our facility staff provides orientation on the policies and procedures of the facility, including resident rights, appropriate forms, and record keeping requirements, to hospice staff furnishing care to the residents.
13. Coordinated care plans for residents receiving hospice services will include the most recent hospice plan of care as well as the care and services provided by our facility (including the responsible provider and discipline assigned to specific tasks) in order to maintain the resident's highest practicable physical, mental and psychosocial well-being.

continues on next page

14. The coordinated care plan will reflect the resident's goals and wishes, as stated in his or her advance directives and during ongoing communication with the resident or representative, including:
 - a. palliative goals and objectives;
 - b. palliative interventions; and
 - c. medical treatment and diagnostic tests.
15. The coordinated care plan shall be revised and updated as necessary to reflect the resident's current status including, but not limited to:
 - a. diagnosis;
 - b. problem list;
 - c. symptom management (pain, nausea, vomiting, etc.);
 - d. bowel and bladder care;
 - e. nutrition and hydration needs;
 - f. oral health;
 - g. skin integrity;
 - h. spiritual, activity and psychosocial needs; and
 - i. mobility and positioning.
16. If our facility suspends or terminates its contract with the hospice provider(s):
 - a. residents who are receiving hospice services will be notified within 24 hours;
 - b. all other residents will be notified promptly;
 - c. residents who elect the hospice benefit will be assisted (at their request) with transferring to the facility of their choice where hospice services are provided;
 - d. residents may elect to remain in the facility and revoke their hospice benefit; or
 - e. our facility may enter into an agreement with another hospice provider.

Organ and Tissue Donation

Policy Statement

Residents who wish to have their organs/tissues donated to medical science for research, transplantation or other scientific use must have such information recorded in their medical record.

Policy Interpretation and Implementation

1. Residents have the right to donate their organs/tissues to medical science for research, transplantation or other scientific use.
2. Documentation (e.g., advance directive, living will, etc.) of the resident’s wish to be an organ donor must be placed in the medical record to ensure that such request is honored in a timely manner.
3. Upon the resident’s death, the designated recipient of the organ/tissue donation will be notified and the facility will follow the protocol established in the advance directive.
4. Inquiries relative to organ/tissue donation should be referred to the administrator and/or director of nursing services.

Palliative Care Program

Policy Statement

1. Palliative care is provided to all residents with persistent or recurring health conditions that adversely affect daily functioning or reduce life expectancy.
2. Palliative care is defined as “patient and family-centered care that optimizes quality of life by anticipating, preventing and treating suffering. Palliative care throughout the continuum of illness involves addressing physical, intellectual, emotional, social and spiritual needs to facilitate [resident] autonomy, access to information and choice” (Centers for Medicaid and Medicare Services).

Policy Interpretation and Implementation

General Palliative Care

1. Access to palliative care is available to residents and families 24 hours a day, seven days a week.
2. The palliative plan of care is based on a comprehensive interdisciplinary assessment of the resident and family.
3. The palliative plan of care is based on the expressed values, goals and needs of the resident and family. *Family* is defined by the resident.
4. Residents and family are provided with information regarding the disease process and prognosis to support informed decision-making regarding care and potential interventions.
5. An interdisciplinary team of qualified palliative care professionals provides services to the resident and family that are consistent with the palliative plan of care.
6. Education, training and support are available to the interdisciplinary team.
7. Volunteers are appropriately trained and supervised.
8. Palliative care outcomes are collected and measured as part of this facility’s commitment to quality assessment and performance improvement.
9. Community resources are identified and utilized to ensure continuity of care throughout the illness trajectory. This includes establishing ongoing collaborative relationships with hospice and acute care providers.
10. The physical environment in which care is provided is consistent with the preferences and needs of the resident and family.

Physical Aspects of Care

1. Pain and physical symptoms (dyspnea, constipation, nausea, anorexia, etc.) are measured and documented using standardized tools.
2. The interdisciplinary team utilizes evidence-based care to manage pain and physical symptoms in residents.

continues on next page

3. The goal of pain and symptom management is safe and timely reduction in symptoms to a level that is acceptable to the resident (or to the family if the resident is unable to communicate clearly).
4. The management of pain and symptoms are considered within the context of the disease and the expressed goals and wishes of the resident and family.

Psychological Aspects of Care

1. Psychological symptoms (anxiety, depression, delirium, behavioral disturbances, etc.) are measured and documented using standardized tools.
2. The interdisciplinary team assesses and manages psychological and psychiatric aspects of palliative care in order to maximize the quality of life and coping skills of the resident and family.
3. The goal of psychological symptom management is safe and timely reduction in symptoms to a level that is acceptable to the resident (or to the family if the resident is unable to communicate clearly).
4. The palliative care program provides education, grief and bereavement support for residents and families. The support is individualized to the resident and family's developmental, cultural and spiritual preferences.
5. Grief and bereavement support for the family does not abruptly end with the death of the resident. Support for the family will continue, as needed, after the death of the resident.

Social Aspects of Care

1. The interdisciplinary team will assess the resident and family's social needs and goals and identify resident-family strengths during the initial assessment.
2. Through education, discussion, support and individualized care, the interdisciplinary team will maximize resident-family strengths and well-being.
3. The individualized care plan will address social concerns of the resident and family, including support for legal decision-making, advanced care-planning, financial concerns, sexuality, and caregiver stress.

Spiritual Aspects of Care

1. The interdisciplinary team will assess the spiritual and religious needs of the resident and family as part of the comprehensive assessment.
2. The interdisciplinary team will identify symptoms of spiritual distress, such as despair, resentment, guilt or hopelessness in residents and families.
3. Support for end-of-life spiritual care is provided in a manner that is consistent with the resident and family's spiritual, religious and cultural values.
4. Communication with the resident and family is respectful of religious and spiritual beliefs, practices and rituals.
5. Spiritual practices are allowed and/or supported to the degree that they are not disruptive to or do not interfere with the safety or well-being of other residents.
6. Palliative care providers do not impose their spiritual or religious values, beliefs or practices on the resident or family.

continues on next page

Cultural Aspects of Care

1. The palliative care program provides services to the resident, family and the community in a manner that is culturally and linguistically appropriate.

Notifying Funeral Home Director of Contagious Disease Level III

Purpose

The purpose of this procedure is to alert funeral home personnel if blood/body fluid precautions should be implemented.

Preparation

Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Body tag:
 - a. _____ (Airborne Precautions);
 - b. _____ (Contact Precautions); or
 - c. _____ (Droplet Precautions).
2. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

General Guidelines

1. In the event that a resident confined to Airborne, Contact, or Droplet Isolation Precautions dies, the Funeral Home Director must be notified of the confinement by the Nurse Supervisor on duty so that the same precautions may be implemented by funeral home personnel.
2. Apply personal protective equipment as indicated.
3. Place the appropriate body tag onto the great toe of the right foot of the resident's body.
4. Wash and dry your hands thoroughly.
5. Other than what is listed on the death certificate, information concerning the resident's diagnosis or specific infectious agent may not be released to funeral home personnel without consent of the resident representative or permission from the resident as indicated in the advance directive.
6. Information concerning the resident or his/her diagnosis requested by funeral home personnel must be directed to administration.

Post Mortem Care

Level III

Purpose

The purposes of this procedure are to prepare the body for viewing by the family and to prepare the body for transfer to the mortuary.

Preparation

Assemble the equipment and supplies as needed.

General Guidelines

1. Do not perform post mortem care until the resident has been pronounced dead.
2. Should a resident of the Catholic faith die without seeing a priest, the Staff/Charge Nurse must summon a priest to the room before releasing the deceased resident to the mortuary.
3. Do not perform any post mortem care on residents of the Jewish faith. A representative of the Chevra Kadisha, Jewish Burial Society, will come and perform the service. Wait for this representative. The family or the Staff/Charge Nurse will inform the society of the death.
4. The Staff/Charge Nurse must fill out and complete the body identification tags.
5. Unless otherwise instructed, remove all jewelry from the deceased resident. If jewelry cannot be removed, or the resident's family requests that jewelry remain on the resident, inform the Staff/Charge Nurse of such request so that this information can be recorded in the resident's medical record.
6. Pack and give all belongings to the resident's family. (Note: If the resident's family cannot pick up the resident's personal belongings at the time of death, store such items until the family members can do so.)
7. Close resident room doors and clear the hallways before transporting the deceased resident through the corridors.
8. Treat the deceased resident with respect and dignity.
9. Handle the deceased resident carefully to prevent distortion, discoloration or scarring of the body.
10. Do not leave the deceased resident's body alone. Remain with the resident until the deceased is released to the mortuary.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Identification tags;
2. Disposable pads;
3. Dressings and adhesive strips;
4. Bath towel and wash cloth;
5. Wash basin filled one-half full of warm water (115°F [46.1°C]);
6. Cotton balls;
7. Brush and comb;
8. Shroud (sheet or clear plastic);
9. Red bag (if necessary);
10. Solvent (for removing old adhesive tape residue);
11. Bag for personal belongings; and

continues on next page

12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Wash and dry your hands thoroughly before beginning the procedure.
2. Obtain the equipment and supplies that will be necessary to perform the procedure. Take them to the resident's room.
3. Obtain additional assistance as necessary.
4. If family members or visitors are present, ask them to wait outside until the procedure has been completed. If possible, the resident's roommate (if any) should be assisted out of the room.
5. Lower the backrest of the bed.
6. Put on gloves.
7. Remove all pillows except one. Place the one pillow under the resident's head.
8. Place the deceased resident in the supine position. Unless otherwise instructed, disconnect all tubes, IV lines, etc.
9. Straighten the arms and legs. (Note: Handle the resident gently to avoid bruising the skin.)
10. If the resident's eyes are open, close them by taking the **eyelashes** and gently pulling them down over the eyes. (Note: Avoid touching the eyelids as this may cause an unnatural appearance.)
11. Bathe and cleanse the body. (Note: Avoid exposing the resident. Keep the resident's body covered as much as possible.)
12. Close the resident's mouth by cupping your hand under the resident's chin and applying slight pressure. (Note: If the mouth will not stay closed, place a rolled towel under the chin.)
13. Comb the resident's hair as necessary.
14. Remove all soiled dressings and bandages and discard into designated containers.
15. Cover all wounds with clean dressings. Use adhesive tape to hold them in place.
16. Unless otherwise instructed, remove all jewelry and give it to the Staff/Charge Nurse.
17. Cover the resident with a sheet. (Note: Place the sheet up over the chest for family viewing.)
18. Position the resident's arms to his or her side.
19. Remove all post mortem care equipment and supplies from the room.
20. Arrange the bedside table and room in a neat manner.
21. Allow the resident's family to view the deceased.
22. Unless otherwise instructed, leave the family alone with the resident.
23. After the family leaves, remain with the deceased until the mortuary personnel arrive.
24. Tie the body identification tag around the resident's ankle or big toe.
25. When the representative from the mortuary arrives, close all resident room doors and clear hallways before moving the deceased resident to the pickup area.
26. Strip the bed and discard all laundry and linen into the soiled laundry container. Red bag as necessary.
27. Pour the bath water and all other used liquids down the commode. Flush the commode.
28. Cleanse and return all reusable equipment to designated storage areas.
29. Return the cubicle curtain to an open position.
30. Permit the roommate to return to the room.
31. Wash and dry your hands thoroughly.

continues on next page

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who performed the procedure.
3. What was done with the resident's personal effects, especially jewelry and dentures.
4. The signature and title of the person recording the data.

Reporting

Report information in accordance with facility policy and professional standards of practice.

Terminal/Dying Resident, Caring for the

Level II

Purpose

The purpose of this procedure is to provide guidelines for the personal care needs of a dying resident.

The Resident's Family

Family participation in end-of-life-care is encouraged. This can sometimes require you to work around the family. As the caregiver you should:

1. Respect the family's need for privacy during their visit.
2. Be courteous and understanding of the family's concerns. Answer questions as permitted.
3. Refer all medical questions to the Nurse.
4. Insofar as permitted by facility policy or the resident's advance directives, honor the family and resident's requests.

The Resident's Personal Care Needs

1. Continue to provide the resident with routine personal care (i.e., bathing, mouth care, etc.).
2. Provide routine skin care and repositioning to make the resident comfortable.
3. Keep the resident's body clean and dry at all times.
4. As the resident approaches death, monitor him or her frequently. Report all changes in the resident's condition to the Nurse promptly.
5. Speak to the resident in a normal tone of voice. Even if the resident appears to be unconscious, he or she may be able to hear and understand what you say.
6. Keep the resident's room well-lighted and ventilated. A dark room may be frightening to the resident.
7. Provide food and liquids to the resident as instructed.
8. Provide routine mouth care. Observe for dry mouth and lips and provide comfort as needed.
9. If the resident is on oxygen (nasal tube or mask), check on the condition of the resident's nostrils. Be sure they do not become dry or encrusted. Report such conditions to the Nurse.
10. If the resident's mouth has a buildup of secretions, report it promptly to the Nurse.
11. Report all changes in the resident's breathing to the Nurse promptly.
12. Keep the resident's room free from distractions.

Signs of Approaching Death

Death may come suddenly or slowly. The following observations are normally signs that death may be near. It is important that you be observant of these signs and report such observations to the Nurse promptly.

1. Due to slowed circulation the resident's hands and feet will feel cold to the touch and appear pale. He or she may complain of being cold. Keep the resident as warm as possible. Conversely, the resident may perspire heavily.
2. The resident may stare blankly into space.
3. There may be minimal eye movement.
4. Due to decreased muscle tone, the resident's jaw may drop and his or her mouth may stay partially open.
5. Respirations may become slower and more difficult.

continues on next page

6. The resident's pulse is often rapid, but may become irregular and weak.
7. Mucus collecting in the resident's throat may cause a gurgling sound.
8. Try to be with the resident as much as possible during this time. Do not leave the dying resident alone if possible.

Falls Prevention - Potential Interventions

Strategies for Reducing the Risk of Falls

Falls – Clinical Protocol

Assessment and Recognition

1. The physician will help identify individuals with a history of falls and risk factors for falling.
 - a. Staff will ask the resident and the caregiver or family about a history of falling.
 - b. The staff and physician will document in the medical record a history of one or more recent falls (for example, within 90 days).
 - c. While many falls are isolated individual incidents, a few individuals fall repeatedly. Those individuals often have an identifiable underlying cause.
2. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Recent injury, especially fracture or head injury;
 - c. Musculoskeletal function, observing for change in normal range of motion, weight bearing, etc.;
 - d. Change in cognition or level of consciousness;
 - e. Neurological status;
 - f. Pain;
 - g. Frequency and number of falls since last physician visit;
 - h. Precipitating factors, details on how fall occurred;
 - i. All current medications, especially those associated with dizziness or lethargy; and
 - j. All active diagnoses.
3. The staff and practitioner will review each resident's risk factors for falling and document in the medical record.
 - a. Examples of risk factors for falling include lightheadedness or dizziness, multiple medications, musculoskeletal abnormalities, peripheral neuropathy, gait and balance disorders, cognitive impairment, weakness, environmental hazards, confusion, visual impairment, hypotension, and medical conditions affecting the central nervous system.
 - b. After a first fall, the staff (and physician, if possible) should watch the individual rise from a chair without using his or her arms, walk several paces, and return to sitting. If the individual has no difficulty or unsteadiness, additional evaluation may not be needed. If the individual has difficulty or is unsteady in performing this test, additional evaluation should occur.
4. The physician will identify medical conditions affecting fall risk (for example, a recent stroke or medications that cause dizziness or hypotension) and the risk for significant complications of falls (for example, increased fracture risk in someone with osteoporosis or increased risk of bleeding in someone taking an anticoagulant).
 - a. Falls often have medical causes; they are not just a "nursing issue."
5. The staff will evaluate and document falls that occur while the individual is in the facility; for example, when and where they happen, any observations of the events, etc.
6. Falls should be categorized as:
 - a. Those that occur while trying to rise from a sitting or lying to an upright position;
 - b. Those that occur while upright and attempting to ambulate; and
 - c. Other circumstances such as sliding out of a chair or rolling from a low bed to the floor.
7. Falls should also be identified as witnessed or unwitnessed events.

continues on next page

Cause Identification

1. For an individual who has fallen, the staff and practitioner will begin to try to identify possible causes within 24 hours of the fall.
 - a. Often, multiple factors contribute to a falling problem.
2. If the cause of a fall is unclear, or if a fall may have a significant medical cause such as a stroke or an adverse drug reaction (ADR), or if the individual continues to fall despite attempted interventions, a physician will review the situation and help further identify causes and contributing factors.
 - a. After a fall, the physician should review the resident's gait, balance, and current medications that may be associated with dizziness or falling.
 - b. Many categories of medications, and especially combinations of medications in several of those categories, increase the risk of falling.
3. The staff and physician will continue to collect and evaluate information until either the cause of the falling is identified, or it is determined that the cause cannot be found or is not correctable.

Treatment/Management

1. Based on the preceding assessment, the staff and physician will identify pertinent interventions to try to prevent subsequent falls and to address the risks of clinically significant consequences of falling.
 - a. Examples of such interventions may include calcium and vitamin D supplementation to address osteoporosis, use of hip protectors, addressing medical issues such as hypotension and dizziness, and tapering, discontinuing, or changing problematic medications (for example, those that could make the resident dizzy or cause blood pressure to drop significantly on standing).
2. If underlying causes cannot be readily identified or corrected, staff will try various relevant interventions, based on assessment of the nature or category of falling, until falling reduces or stops or until a reason is identified for its continuation (for example, if the individual continues to try to get up and walk without waiting for assistance).

Monitoring and Follow-Up

1. The staff, with the physician's guidance, will follow up on any fall with associated injury until the resident is stable and delayed complications such as late fracture or subdural hematoma have been ruled out or resolved.
 - a. Delayed complications such as late fractures and major bruising may occur hours or days after a fall, while signs of subdural hematomas or other intracranial bleeding could occur up to several weeks after a fall.
2. The staff and physician will monitor and document the individual's response to interventions intended to reduce falling or the consequences of falling.
 - a. Frail elderly individuals are often at greater risk for serious adverse consequences of falls.
 - b. Risks of serious adverse consequences can sometimes be minimized even if falls cannot be prevented.
3. If interventions have been successful in fall prevention, the staff will continue with current approaches and will discuss periodically with the physician whether these measures are still needed; for example, if the problem that required the intervention has resolved by addressing the underlying cause.

continues on next page

4. If the individual continues to fall, the staff and physician will re-evaluate the situation and reconsider possible reasons for the resident's falling (instead of, or in addition to those that have already been identified) and also reconsider the current interventions.
5. As needed, and after an appropriately thorough review, the physician will document any uncorrectable risk factors and underlying causes.

Fall Risk Assessment

Policy Statement

The nursing staff, in conjunction with the attending physician, consultant pharmacist, therapy staff, and others, will seek to identify and document resident risk factors for falls and establish a resident-centered falls prevention plan based on relevant assessment information.

Policy Interpretation and Implementation

1. Upon admission, the nursing staff and the physician will review a resident’s record for a history of falls, especially falls in the last 90 days and recurrent or periodic bouts of falling over time.
2. The nursing staff will ask the resident and/or his/her family about any history of the resident falling.
3. The nursing staff, attending physician, and consultant pharmacist will review for medications or medication combinations that could relate to falls or fall risk, such as those that have side effects of dizziness, ataxia, or hypotension.
4. The staff will look for evidence of a possible link between the onset of falling (or an increase in falling episodes) and recent changes in the current medication regimen.
5. The attending physician and nursing staff will evaluate the resident’s vital signs, assess the resident for medical conditions (such as those that cause dizziness or vertigo) or sensory impairments (such as decreased vision and peripheral neuropathy) that may predispose to falls.
6. Assessment data shall be used to identify underlying medical conditions that may increase the risk of injury from falls (such as osteoporosis).
7. The staff, with the support of the attending physician, will evaluate functional and psychological factors that may increase fall risk, including ambulation, mobility, gait, balance, excessive motor activity, activities of daily living (ADL) capabilities, activity tolerance, continence, and cognition.
8. The staff will seek to identify environmental factors that may contribute to falling, such as lighting and room layout.
9. The staff and attending physician will collaborate to identify and address modifiable fall risk factors and interventions to try to minimize the consequences of risk factors that are not modifiable.

Falls and Fall Risk, Managing

Policy Statement

Based on previous evaluations and current data, the staff will identify interventions related to the resident's specific risks and causes to try to prevent the resident from falling and to try to minimize complications from falling.

Policy Interpretation and Implementation

Definition

According to the MDS, a fall is defined as:

Unintentionally coming to rest on the ground, floor or other lower level, but not as a result of an overwhelming external force (e.g., a resident pushes another resident). An episode where a resident lost his/her balance and would have fallen, if not for another person or if he or she had not caught him/herself, is considered a fall. A fall without injury is still a fall. Unless there is evidence suggesting otherwise, when a resident is found on the floor, a fall is considered to have occurred.

Challenging a resident's balance and training him/her to recover from loss of balance is an intentional therapeutic intervention. The losses of balance that occur during supervised therapeutic interventions are not considered a fall.

Fall Risk Factors

1. Environmental factors that contribute to the risk of falls include:
 - a. wet floors;
 - b. poor lighting;
 - c. incorrect bed height or width;
 - d. obstacles in the footpath;
 - e. improperly fitted or maintained wheelchairs; and
 - f. footwear that is unsafe or absent.
2. Resident conditions that may contribute to the risk of falls include:
 - a. fever;
 - b. infection;
 - c. delirium and other cognitive impairment;
 - d. pain;
 - e. lower extremity weakness;
 - f. poor grip strength;
 - g. medication side effects;
 - h. orthostatic hypotension;
 - i. functional impairments;
 - j. visual deficits; and
 - k. incontinence.

continues on next page

3. Medical factors that contribute to the risk of falls include:
 - a. arthritis;
 - b. heart failure;
 - c. anemia;
 - d. neurological disorders; and
 - e. balance and gait disorders; etc.

Resident-Centered Approaches to Managing Falls and Fall Risk

1. The staff, with the input of the attending physician, will implement a resident-centered fall prevention plan to reduce the specific risk factor(s) of falls for each resident at risk or with a history of falls.
2. If a systematic evaluation of a resident's fall risk identifies several possible interventions, the staff may choose to prioritize interventions (i.e., to try one or a few at a time, rather than many at once).
3. Examples of initial approaches might include exercise and balance training, a rearrangement of room furniture, improving footwear, changing the lighting, etc.
4. In conjunction with the consultant pharmacist and nursing staff, the attending physician will identify and adjust medications that may be associated with an increased risk of falling, or indicate why those medications could not be tapered or stopped, even for a trial period.
5. If falling recurs despite initial interventions, staff will implement additional or different interventions, or indicate why the current approach remains relevant.
6. If underlying causes cannot be readily identified or corrected, staff will try various interventions, based on assessment of the nature or category of falling, until falling is reduced or stopped, or until the reason for the continuation of the falling is identified as unavoidable.
7. In conjunction with the attending physician, staff will identify and implement relevant interventions (e.g., hip padding or treatment of osteoporosis, as applicable) to try to minimize serious consequences of falling.
8. Position-change alarms will not be used as the primary or sole intervention to prevent falls, but rather will be used to assist the staff in identifying patterns and routines of the resident. The use of alarms will be monitored for efficacy and staff will respond to alarms in a timely manner.

Monitoring Subsequent Falls and Fall Risk

1. The staff will monitor and document each resident's response to interventions intended to reduce falling or the risks of falling.
2. If interventions have been successful in preventing falling, staff will continue the interventions or reconsider whether these measures are still needed if a problem that required the intervention (e.g., dizziness or weakness) has resolved.
3. If the resident continues to fall, staff will re-evaluate the situation and whether it is appropriate to continue or change current interventions. As needed, the attending physician will help the staff reconsider possible causes that may not previously have been identified.
4. The staff and/or physician will document the basis for conclusions that specific irreversible risk factors exist that continue to present a risk for falling or injury due to falls.

Assessing Falls and Their Causes

Level III

Purpose

The purposes of this procedure are to provide guidelines for assessing a resident after a fall and to assist staff in identifying causes of the fall.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Identify the resident's current medications and active medical conditions.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Falls are a leading cause of morbidity and mortality among the elderly in nursing homes.
2. Fear of falling may limit an individual's participation in activities.
3. Falling may be related to underlying clinical or medical conditions, overall functional decline, medication side effects, and/or environmental risk factors.
4. Residents must be assessed upon admission and regularly afterward for potential risk of falls. Relevant risk factors must be addressed promptly.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Equipment to assess vital signs, such as stethoscope; sphygmomanometer or electronic blood pressure device; and oral or rectal thermometer;
2. Tools to assess resident's level of consciousness and neurological status, if necessary;
3. First Aid Kit, if necessary;
4. Resident's medical chart; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

After a Fall:

1. If a resident has just fallen, or is found on the floor without a witness to the event, evaluate for possible injuries to the head, neck, spine, and extremities.
2. Obtain and record vital signs as soon as it is safe to do so.
3. If there is evidence of injury, provide appropriate first aid and/or obtain medical treatment immediately.
4. If an assessment rules out significant injury, help the resident to a comfortable sitting, lying, or standing position, and then document relevant details.
5. Notify the resident's attending physician and family in an appropriate time frame.
 - a. When a fall results in a significant injury or condition change, notify the practitioner immediately by phone.
 - b. When a fall does not result in significant injury or a condition change, notify the practitioner routinely (e.g., by fax or by phone the next office day).

continues on next page

6. Observe for delayed complications of a fall for approximately forty-eight (48) hours after an observed or suspected fall, and will document findings in the medical record.
7. Document any observed signs or symptoms of pain, swelling, bruising, deformity, and/or decreased mobility; and any changes in level of responsiveness/consciousness and overall function. Note the presence or absence of significant findings.
8. Complete an incident report for resident falls no later than 24 hours after the fall occurs. The incident report form should be completed by the nursing supervisor on duty at the time and submitted to the Director of Nursing Services.

Defining Details of Falls:

1. After an observed or probable fall, clarify the details of the fall, such as when the fall occurred and what the individual was trying to do at the time the fall occurred.
2. For each individual, distinguish falls in the following categories:
 - a. Rolling, sliding, or dropping from an object (e.g., from bed or chair to floor);
 - b. Falling while attempting to stand up from a sitting or lying position; or
 - c. Falling while already standing and trying to ambulate.

Identifying Causes of a Fall or Fall Risk:

1. Within 24 hours of a fall, begin to try to identify possible or likely causes of the incident. Refer to resident-specific evidence including medical history, known functional impairments, etc.
2. Evaluate chains of events or circumstances preceding a recent fall, including:
 - a. Time of day of the fall;
 - b. Time of the last meal;
 - c. What the resident was doing;
 - d. Whether the resident was standing, walking, reaching, or transferring from one position to another;
 - e. Whether the resident was among other persons or alone;
 - f. Whether the resident was trying to get to the toilet;
 - g. Whether any environmental risk factors were involved (e.g., slippery floor, poor lighting, furniture or objects in the way); and/or
 - h. Whether there is a pattern of falls for this resident.
3. Continue to collect and evaluate information until the cause of falling is identified or it is determined that the cause cannot be found.
4. As indicated, the attending physician will examine the resident or may initiate testing to try to identify causes.
5. Consult with the attending physician or medical director to confirm specific causes from among multiple possibilities. When possible, document the basis for identifying specific factors as the cause.
6. If the cause is unknown but no additional evaluation is done, the physician or nursing staff should note why (e.g., workup already done, finding a cause would not change the approach, etc.).

Performing a Post-Fall Evaluation:

1. After a first fall, a nurse and/or physical therapist will watch the resident attempt to rise from a chair without using his or her arms, walk several paces, and return to sitting, and will document the results of this effort.
2. If the individual has no difficulty or unsteadiness, no further evaluation is needed at that time.
3. If the individual has difficulty or is unsteady in performing this test, additional evaluation may be initiated as warranted.

continues on next page

Documentation

When a resident falls, the following information should be recorded in the resident’s medical record:

1. The condition in which the resident was found (e.g., “resident found lying on the floor between bed and chair”).
2. Assessment data, including vital signs and any obvious injuries.
3. Interventions, first aid, or treatment administered.
4. Notification of the physician and family, as indicated.
5. Completion of a falls risk assessment.
6. Appropriate interventions taken to prevent future falls.
7. The signature and title of the person recording the data.

Reporting

1. Notify the following individuals when a resident falls:
 - a. The resident’s family;
 - b. The Attending Physician (timing of notification may vary, depending on whether injury was involved);
 - c. The Director of Nursing Services; and
 - d. The Nursing Supervisor on duty.
2. Report other information in accordance with facility policy and professional standards of practice.

Bowel (Lower Gastrointestinal Tract) Disorders – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the staff and physician will help identify individuals with previously identified lower gastrointestinal tract conditions and symptoms. This should include a review of gastrointestinal problems during any recent hospitalizations, results of previous barium studies, endoscopies, etc.
2. Examples of lower gastrointestinal tract conditions and symptoms include:
 - a. Residents with a history of diarrhea;
 - b. Fecal incontinence;
 - c. Irritable bowel syndrome;
 - d. Pain with defecation;
 - e. Passing blood rectally;
 - f. Alteration in bowel movements;
 - g. Ulcerative colitis or regional enteritis; and/or
 - h. Residents taking antidiarrheal medications or medications related to bowel motility.
3. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Quantitative and qualitative description of diarrhea (how many episodes in what period of time, amount, consistency, etc.);
 - c. Change in mental status or level of consciousness;
 - d. Presence of fecal impaction;
 - e. Signs of dehydration (altered level of consciousness, lethargy, dizziness, recent change in mental status, dry mucous membranes, decreased urine output);
 - f. Abdominal assessment;
 - g. Digital rectal examination;
 - h. Onset, duration, frequency, severity of signs and symptoms;
 - i. All current medications;
 - j. All active diagnoses; and
 - k. Recent labs.
4. The staff and physician will identify risk factors related to bowel dysfunction; for example, severe anxiety disorder, recent antibiotic use, or taking medications that are used to treat, or that may cause or contribute to, gastrointestinal erosion, bleeding, diarrhea, dysmotility, etc.
5. The staff and physician will characterize symptoms related to bowel function; for example, location and radiation of abdominal pain, time relationship to meals, presence of cramps or bloating, etc.
6. Check for diffuse or localized tenderness and listen for bowel sounds in area of suspected ileus or obstruction.
7. Correct terminology is important; for example, “loose stools” do not necessarily constitute “diarrhea,” “stomach” is not the same as “abdomen,” etc. Consistent terminology and documentation over time enable comparison of symptoms and evaluation of the effectiveness of specific interventions.

continues on next page

Cause Identification

1. The physician will help staff define and appropriately categorize a problem related to bowel dysfunction; for example: by general location (upper or lower GI); type of disorder (motility, absorption, bleeding, etc.), severity, and likely causes.
2. The physician will identify and order a pertinent diagnostic evaluation for bowel dysfunction; for example, stool for occult blood, enteric pathogens or toxins; endoscopy, etc.
3. The physician and staff will identify current medications that are associated with gastrointestinal side effects, such as medications used to treat urinary incontinence, other medications with significant anticholinergic properties, antipsychotics and antidepressants, cardiac medications, cholinesterase inhibitors, etc.

Treatment/Management

1. The physician will identify and order pertinent cause-specific and symptomatic interventions; for example, modify tube feedings, address underlying emotional or mood disorder, stop medications causing ileus, adjust foods related to malabsorption, institute a regimen to prevent constipation, etc.
2. Antidiarrheal medications should be used judiciously, as they may prolong infectious diarrhea, mask underlying conditions, or cause significant side effects.
3. The staff and physician will address significant complications due to bowel dysfunction such as fluid and electrolyte imbalance caused by diarrhea.
4. Oral rehydration solutions, hypodermoclysis, or intravenous hydration may be indicated, depending on the severity and duration of diarrhea.
5. The physician will help identify the possible need for hospitalization to manage a gastrointestinal disorder; for example, when intestinal infarction, peritonitis, or mechanical obstruction is suspected.
6. The attending physician will collaborate with staff and the medical director to identify individuals who need contact or isolation precautions because of infectious diarrhea or fecal incontinence.

Monitoring and Follow-Up

1. The staff and physician will monitor the individual's response to interventions and overall progress; for example, overall degree of comfort or distress, frequency and consistency of bowel movements, and the frequency, severity, and duration of abdominal pain, etc.
2. The physician will adjust interventions based on identification of causes, resident responses to treatment, and other relevant factors.
3. Before prescribing additional courses of medications, the physician should carefully evaluate and examine directly an individual who has not responded as expected to an initial course of treatment such as antidiarrheal medications, changes in the bowel regimen, etc.

Gastroesophageal Reflux and Other Upper Gastrointestinal Disorders – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals with upper GI disorders and clarify the nature of the disorder; for example, distinguish true GERD or peptic ulcer disease from dyspepsia or other more benign conditions.
 - a. The staff should identify symptoms in sufficient detail, including onset, duration, intensity, frequency, and any link with meals.
 - b. It is not appropriate to simply document the term “GERD” in the record based on vague signs and symptoms or current utilization of proton pump inhibitors (PPIs) (or other medications) without additional clarification.
2. The physician and staff will identify individuals with symptoms that may be associated with GERD, such as dysphagia, lump in the throat, epigastric or throat pain, and nausea or vomiting.
 - a. The physician will evaluate whether the symptoms could be due to GERD or another upper GI disorder.
3. Reduction of symptoms after administering PPIs is not sufficient evidence to diagnose GERD.

Cause Identification

1. The physician will help identify or clarify causes of upper gastrointestinal symptoms including reflux disease. Upper gastrointestinal symptoms have diverse causes and definitive treatment often depends on the cause.
2. As part of the evaluation, the physician, nurses, and consultant pharmacist should review a resident/patient’s existing medication regimen for medications that may cause or exacerbate upper GI symptoms; for example, bisphosphonates and nonsteroidal anti-inflammatory medications.
 - a. Many drugs can cause or increase the risk of having upper GI complications and symptoms.
 - b. The physician should review relative benefits and risks in those residents/patients who need to continue medications that are associated with GERD or upper GI bleeding, such as aspirin, other nonsteroidal anti-inflammatory drugs (NSAIDs), and anti-osteoporosis medications.
3. If the diagnosis is unclear, the physician will determine whether the resident could benefit from, and tolerate, a workup.
 - a. The physician may choose to initiate empiric treatment if the individual is too frail or uncooperative to tolerate invasive procedures such as endoscopy, when there is little risk for complications from an imprecise or tentative diagnosis, when the underlying cause is not treatable, or when the history and clinical findings strongly suggest a specific diagnosis.
4. The physician and nursing staff will collaborate to seek more detailed information about upper gastrointestinal symptoms that persist or recur frequently, if the clinical course is not proceeding as anticipated, or when worrisome signs and symptoms such as persistent dysphagia, bleeding or weight loss develop.

continues on next page

Treatment/Management

1. To the extent possible, the physician will address causes and contributing factors, including discontinuing or modifying doses of medications that reduce lower esophageal sphincter (LES) pressure, slow gastric emptying, or cause mucosal damage in at-risk residents.
2. The physician will select treatments based on the preceding assessments and on pertinent evidence and guidelines.
 - a. For peptic ulcer disease, therapy with multiple agents including PPIs is usually indicated. However, once a peptic ulcer due to *H. Pylori* has been successfully treated, continued use of PPIs may not be necessary.
 - b. An H2 blocker may be successful in many cases of uncomplicated or intermittent reflux or dyspepsia, and can be tried for at least two weeks before switching to PPIs, unless there is a significant history or risk of more serious GI disease such as bleeding ulcers.
 - c. In cases of dyspepsia or occasional reflux without signs, symptoms or history of gastrointestinal erosion or bleeding, antacid medications other than PPIs may be effective.
 - d. It is appropriate to reserve PPIs for those who have, or are at high risk for, erosive or refractory non-erosive esophagitis caused by GERD. For PPIs, cost considerations are relevant as there is no definitive evidence that one PPI is superior to another in treating GERD.
 - e. With rare exception, prokinetic agents such as metoclopramide are not indicated as first-line treatment for GI symptoms in elderly and other at-risk patients, because of significant side effects.
3. In individuals with proven or suspected GERD, the staff will also institute appropriate conservative approaches including positioning, diet modification, loosening tight clothing, stopping smoking and alcohol use, and avoiding eating prior to lying down.
4. The physician will consider situations where surgical treatment may be indicated for upper GI disorder; for example, relatively healthy individuals with good life expectancy, who have recurrent respiratory complications such as aspiration pneumonia or asthma.

Monitoring and Follow-Up

1. The physician and staff will monitor the progress and symptoms of individuals with upper gastrointestinal conditions and symptoms, and adjust interventions accordingly.
2. Nursing staff should document and communicate sufficiently detailed observations and resident history; for example, at least periodically describe the characteristics (frequency, location, duration, exacerbating factors, etc.) of any upper GI symptoms, and not just continually write or report that the resident has chest pain, nausea, “heartburn,” or “indigestion.”
3. If empirical treatment is started for upper GI symptoms such as heartburn or chest pain of suspected GI origin, the physician will re-evaluate the situation within a month, to determine if the symptoms were temporary or enduring.
4. The symptoms or the underlying cause may be temporary, or they may improve despite (not necessarily because of) continued use of medications.
5. The physician and staff will monitor for adverse drug reactions related to medications used to treat upper GI disorders, including GERD; for example, nausea, diarrhea, and abdominal pain with PPIs; anorexia, confusion, psychosis, and dyskinesia with metoclopramide; or headache and confusion with H2 blockers.

Gastrointestinal Bleeding, Acute and Chronic – Clinical Protocol

Assessment and Recognition

1. The physician will identify individuals with a history of gastrointestinal (GI) bleeding and those who are at significant risk of gastrointestinal bleeding; for example, individuals taking Prednisone or nonsteroidal anti-inflammatory drugs (NSAIDs), those with a recent severe acute illness, or those with a history of gastrointestinal disorders association with bleeding such as peptic ulcer disease or ulcerative colitis.
2. The physician and staff will identify details related to active gastrointestinal bleeding, such as general location (upper or lower GI), association with meals, related pain, presence of clots, tarry or black stools, orthostatic (postural) hypotension, dizziness, tachycardia, etc.
 - a. For example, check stool or vomitus for occult blood, check for orthostasis in suspected GI bleeding, check bowel sounds and rectal tenderness in cases of lower gastrointestinal bleeding.

Cause Identification

1. The physician will try to identify causes of GI bleeding by ordering pertinent diagnostic tests and/or consultations; for example, stool for enteric pathogens, abdominal x-ray, endoscopy or colonoscopy, etc.
2. Alternatively, the physician will document why investigation of causes is not warranted; for example, the resident cannot cooperate with endoscopy, advance directives decline additional testing, or identification of causes is unlikely to change the treatment or the outcome.
3. The staff and physician will seek and identify complications of gastrointestinal bleeding such as lethargy, activity intolerance, and anemia.

Treatment/Management

1. The physician will address treatable causes and complications of gastrointestinal bleeding. This might include fluid replacement (if needed) to maintain adequate circulating volume, treating colitis, or stopping medications associated with esophageal or gastric irritation or erosion; for example, aspirin, nonsteroidal anti-inflammatory drugs (NSAIDs), chemotherapy agents, corticosteroids, medications used to treat osteoporosis, etc.
2. Alternatively, the physician should explain why the medication is needed despite apparent gastrointestinal complications and institute pertinent prophylaxis.
3. Proton pump inhibitors (PPIs) may protect against some causes of gastric or esophageal erosion, but do not necessarily prevent bleeding from other diverse causes.
4. The physician and nursing staff will collaborate to characterize the severity and urgency of the situation, based on vital sign stability, amount of bleeding, resident distress, etc.
5. The physician and nursing staff will collaborate to identify individuals who need to transfer to the hospital for additional evaluation or treatment for example, due to relentless bleeding or hypotension due to blood loss.

continues on next page

Monitoring and Follow-Up

1. The staff and physician will monitor the individual with gastrointestinal bleeding, including response to intervention, status of bleeding, and progress in revolving underlying causes.
2. The physician will adjust interventions based on the resident/patient response and other pertinent factors, including resident/patient wishes for hospitalization and life-sustaining treatments

Changing a Percutaneous Endoscopic Gastrostomy (PEG) Tube

Level III

Purpose

The purpose of this procedure is to provide guidelines for replacing a percutaneous endoscopic gastrostomy (PEG) tube.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.
4. Ensure that the equipment and devices are working properly by performing any checks as instructed by the manufacturer or this facility.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Gastrostomy tube (size ordered by physician);
4. Water-soluble lubricant;
5. Two (2) 10 mL syringes;
6. Normal saline;
7. Sterile water; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

General Guidelines

1. Consider replacing a PEG tube:
 - a. according to manufacturer's instructions;
 - b. if the tube becomes worn, clogged, or is removed unexpectedly;
 - c. if the internal balloon ruptures;
 - d. if there is a persistent peristomal infection that is unresponsive to antimicrobial treatment;
 - e. if there is skin excoriation;
 - f. if there is a non-healing ulcer that does not respond to appropriate wound care;
 - g. if there is stomal tract disruption;
 - h. if gastrocolic or colocutaneous fistulas develop; or
 - i. as ordered.
2. Replace the PEG tube only after the stomal tract is fully healed (30-90 days after insertion).
3. PEG tube replacement must be performed by a licensed nurse who has received training and demonstrated competency in this procedure.
4. Examine the tube and for wear, splits, cracks or leaks with each feeding.
5. If a feeding tube must be replaced unexpectedly, notify the practitioner.

continues on next page

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Apply clean gloves.
4. Obtain ten (10) mL syringe, deflate balloon in existing gastrostomy tube.
5. Apply gentle pressure to abdomen with non dominant hand and gently pull upward with dominant hand on the gastrostomy tube.
6. Discard old gastrostomy tube in designated container.
7. Clean site with normal saline.
8. Open package and leave gastrostomy tube in package.
9. Check for proper inflation of balloon by inflating the balloon with ten (10) mL of sterile water and deflating the balloon.
10. Remove gastrostomy tube from package by the large end of the tube.
11. Apply lubricant to tip of gastrostomy tube.
12. Gently insert gastrostomy tube into gastrostomy opening six (6) to eight (8) inches.
13. Stop the procedure if resistance is met and try again.
14. Obtain syringe with sterile water and inflate balloon with five (5) mL of sterile water.
15. Pull gastrostomy tube upward so that the balloon is resting against the inside of stomach wall and secure with the disc.
16. Clamp the gastrostomy tube if not in use.
17. Place the wash cloth and towel in the soiled laundry container.
18. Discard disposable supplies in the designated containers.
19. Clean the overbed table and return it to its proper position.
20. Reposition the bed covers. Make the resident comfortable.
21. Place the call light within easy reach of the resident.
22. Remove gloves and discard into designated container.
23. Wash your hands.
24. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. The gastrostomy tube size and inflation of balloon.
3. The name and title of the individual(s) who performed the procedure.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

continues on next page

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Checking Gastric Residual Volume (GRV)

Level III

Purpose

The purpose of this procedure is to assess tolerance of enteral feeding and minimize the potential for aspiration.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

General Guidelines

1. Do not use gastric residual volume (GRV) as a routine indicator of proper feeding tube location, feeding tolerance, or risk of aspiration.
2. Check GRV if clinical assessment reveals:
 - a. the resident is not tolerating enteral feedings (nausea, vomiting, distention);
 - b. the marked position of the tube has changed;
 - c. appearance and pH of aspirate suggests the tube is misplaced; or
 - d. as ordered.
3. Evaluate residents who are receiving enteral nutrition for the risk of aspiration, including:
 - a. Sedation;
 - b. Supine position;
 - c. Improper position of the feeding tube;
 - d. Vomiting;
 - e. Bolus feedings;
 - f. Poor health; and
 - g. Advanced age.
4. Visually check the position of the feeding tube before the initiation of each feeding.
5. Keep the head of the bed (HOB) elevated 30° during feedings and for at least 1 hour after feedings.
6. Measure GRV with at least a 60mL syringe.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Sixty (60) mL enteral syringe (with transition adapter if necessary); and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves and use aseptic technique when handling enteral tubes and equipment.
4. Attach sixty (60) mL syringe to end of catheter tube.
5. If catheter is clamped, unclamp catheter.
6. Aspirate stomach contents (GRV):
 - a. If **GRV is between 250-500 mL**, take measures to reduce the risk of aspiration.
 - b. If the **GRV is greater than 500 mL**, notify the physician. Assess resident for feeding intolerance.
 - c. If the resident is on continuous tube feedings, the stomach should contain no more than the total intake from the last hour. If so, withhold feeding and notify the physician.
 - d. If the resident is free of obvious symptoms of GI intolerance (distention, vomiting, and constipation) or respiratory distress, return aspirated GRV to the stomach (via the tube).
7. If acceptable GRV is verified, flush tubing with at least 30 mL warm sterile water (or prescribed amount).
8. Remove the syringe and clamp tubing.
9. Discard disposable supplies in the designated containers.
10. Clean reusable equipment according to the manufacturer's instructions.
11. Clean the overbed table and return it to its proper position.
12. Reposition the bed covers. Make the resident comfortable.
13. Place the call light within easy reach of the resident.
14. Remove gloves and discard into designated container.
15. Wash your hands.
16. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. The amount, if any, of gastric residual.
3. The name and title of the individual(s) who performed the procedure.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

continues on next page

Reporting

1. Report results promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Cleansing Enema

Level III

Purpose

The purpose of this procedure is to promote defecation.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Should a regular-sized bedpan be uncomfortable to the resident or if the resident's medical condition requires, use a fracture pan for the procedure.
2. Report any complaints the resident may have to your supervisor before beginning the procedure.
3. Should the resident complain of cramps after you have started the enema, stop the flow of solution until the pain has subsided.
4. When administering the solution, **do not** raise the enema container more than eighteen (18) inches above the mattress, or more than twelve (12) inches above the buttocks.
5. Prepare cleansing enema solutions as follows:
 - a. **Soapsuds:** Mix one (1) package of enema soap to 1,000 ccs of warm water. Stir the solution gently with the tip of the tubing to prevent the forming of suds.
 - b. **Saline:** Mix two (2) teaspoons of salt to 1,000 ccs of warm water.
 - c. **Tap Water:** Use 1,000 ccs of warm tap water. Do not add anything to the water.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Enema tray (container, tubing, clamp, and lubricant);
2. Tray cover;
3. Solution (as prescribed);
4. Toilet tissue;
5. Wash basin;
6. Soap;
7. Towel;
8. Wash cloth;
9. Graduated pitcher (if enema container not marked);
10. Bath thermometer;
11. Bedpan;
12. Paper towels;
13. Bed protector (disposable or plastic);
14. Bath blanket/sheet, etc.;
15. Urinal (as necessary); and
16. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Adjust the resident's clothing to expose the buttocks. Cover the resident to limit exposure and provide privacy.
5. Place the bed protector under the resident's buttocks.
6. Assist the resident to turn on his/her left side. Bend the right knee toward his/her chest, unless contraindicated by the resident's medical condition. (This is the Left Sims Position or Enema Position.)
7. Place the bedpan at the foot of the bed. Be sure that it is in easy reach.
8. Close the clamp on the enema tubing.
9. Fill the graduated container with 1,000 ccs of warm water (105°F or 40.5°C). Test the water with the bath thermometer.
10. Pour the water into the enema container. Mix solutions as prescribed.
11. Hold the tubing over the bedpan. Open the clamp on the enema container. Let a small amount of the solution run through the tubing into the bedpan to eliminate any air in the tubing. Close the clamp.
12. Lubricate the tip of the tubing about 3 to 4 inches. Be sure the tube is well lubricated. Check the opening of the tube to be sure that it is not plugged.
13. Expose the buttocks. (Note: Grasp the privacy cover at the anal area. Lift it up and fold over the buttocks.)
14. Separate the buttocks so that you can see the anal area.
15. Grasp the tubing about 5 to 6 inches from the end. Gently insert the enema tip 3 to 4 inches through the anus into the rectum. (Note: If you feel resistance or if the resident complains of pain, stop the procedure and summon the staff/charge nurse.)
16. Raise the enema container about twelve (12) inches above the buttocks. (Note: Do not raise the container more than eighteen [18] inches.)
17. Open the clamp and let the solution run in slowly. Instruct the resident to breathe slowly through his/her mouth. (Note: This will help relax the resident.) If the resident complains of cramping, you may need to lower the container or clamp the tubing for a moment until the discomfort eases.
18. When the solution has finished running into the rectum, clamp the tubing.
19. Slowly withdraw the rectal tubing.
20. To prevent contamination, wrap the end of the tubing in a paper towel. Place the tubing into the enema container. Place the enema container on a paper towel.
21. Encourage the resident to hold the solution as long as possible.
22. Assist the resident onto the bedpan. (Note: If the resident is unable to hold the solution, put the bedpan underneath the resident before giving the enema.)
23. Discard gloves into the designated container. Wash and dry your hands thoroughly.
24. Unless otherwise instructed, raise the back of the bed so that the resident will be in a near sitting position.
25. Place the toilet tissue within easy reach of the resident.
26. Provide the resident with as much privacy as possible. Place the call light within easy reach of the resident. Assure the resident that you will be near should he/she need assistance.
27. Place the side rails in the appropriate position as indicated in the resident's plan of care.
28. Remove the enema equipment while the resident is on the bedpan. Discard disposable items into the designated container. Clean and sanitize any reusable equipment and place in the designated storage area. Discard gloves into the designated container. Wash and dry your hands thoroughly.
29. If the resident is having trouble expelling the solution, notify your supervisor.
30. When you return to the resident, wash and dry your hands thoroughly and put on gloves.

continues on next page

31. When the resident has expelled the solution, remove the bedpan. Check the results of the enema. Look for color, consistency, odor, amount, etc.
32. Collect a specimen, if ordered.
33. Empty the solution into the commode. Flush the commode. Clean and store the bedpan in accordance with facility protocols.
34. Fill the wash basin one-half (1/2) full of warm water. Take to the bedside. Inspect the resident's buttocks. Wash, rinse, and dry as necessary. Assist resident in washing his/her hands.
35. Remove the bed protector. Discard as indicated.
36. Remove the bath blanket. Fold and store, or discard into the soiled linen container.
37. Return gown or pajamas to the appropriate position. Pull top covers back over resident.
38. Change linen as necessary. Discard dirty linen into designated container. Discard gloves into designated container. Wash and dry your hands thoroughly.
39. Discard disposable items into designated containers.
40. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
41. Reposition the bed covers. Make the resident comfortable.
42. Place the call light within easy reach of the resident.
43. Clean wash basin and return to designated storage area.
44. Clean the bedside stand.
45. Wash and dry your hands thoroughly.
46. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the enema was administered.
2. The name and title of the individual who administered the enema.
3. The type of enema and the amount of solution used.
4. The type of solution used (i.e., soapsuds, saline, or tap water).
5. All assessment data obtained during the procedure.
6. Results of enema (i.e., color, odor, blood, soft, hard, large or small amounts, if gas was expelled, etc.).
7. If a specimen was collected.
8. How the resident tolerated the procedure.
9. If the resident refused the procedure, the reason(s) why.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the enema.
2. Report other information in accordance with facility policy and professional standards of practice.

Colostomy/Ileostomy Care

Level III

Purpose

The purpose of this procedure is to provide guidelines that will aid in preventing exposure of the resident's skin to fecal matter.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Skin cleansing preparation;
2. Clean drainage bag;
3. Soap and water;
4. Barrier creams and lotions (as indicated); and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gown if soiling of clothing with feces is likely.
4. Put on gloves.
5. Remove drainage bag.
6. Remove gloves, wash hands, put on clean gloves.
7. Cleanse skin with appropriate skin cleansing preparation.
8. When evaluating the condition of the resident's skin, note the following:
 - a. Breaks in the skin.
 - b. Excoriation.
 - c. Signs of infection (heat, swelling, pain, redness, purulent exudate, etc.).
9. Remove soiled items. Do not place on overbed table. Replace with clean drainage bag.
10. Place disposable bags into appropriate receptacle.
11. Discard disposable items into designated containers.
12. Remove and discard gown into designated container.
13. Remove and discard gloves into designated container. Wash and dry your hands thoroughly.
14. Reposition the bed covers. Make the resident comfortable.
15. Place the call light within easy reach of the resident.
16. Clean the overbed table and return it to its proper position.
17. Wash and dry your hands thoroughly.

continues on next page

18. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
19. Document the procedure in resident’s documentation form.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the colostomy/ileostomy care was provided.
2. The name and title of the individual(s) who provided the colostomy/ileostomy care.
3. Any breaks in resident’s skin, signs of infection (purulent discharge, pain, redness, swelling, temperature), or excoriation of skin.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the colostomy/ileostomy care.
2. Notify the supervisor of any abnormal findings (i.e., breaks in skin, excoriation, signs of infection, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Confirming Placement of Feeding Tubes

Level III

Purpose

The purpose of this procedure is to ensure proper placement of an existing feeding tube prior to administering enteral feedings or medication.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Verify that placement of the feeding tube was confirmed by X-ray upon initial insertion and that the tube has been marked or the tube length has been documented.
3. Review the resident's care plan and provide for any special needs of the resident.
4. Assemble equipment and supplies needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Sixty (60) mL enteral syringe (with transition adapter if necessary);
4. Stethoscope;
5. pH strips; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so that they can be easily reached.
2. Wash hands and dry thoroughly.
3. Apply clean gloves.

To Confirm Placement of an Existing Feeding Tube at the Bedside:

1. The exit site of the feeding tube should be marked (by incremental marking on the tube or by documented tube length) at time of initial placement.
2. If a change in the incremental markings or tube length is observed, use additional method(s) to test whether the tube is properly positioned:
 - a. Observe for symptoms of elevated gastric residual volume (GRV):
 - (1) A sharp increase in residual volume may indicate that a small bowel tube has moved into the stomach;
 - (2) Little to no residual volume may suggest that the tube has migrated from the stomach to the esophagus.
 - b. Observe and check the pH of aspirate:
 - (1) Fasting stomach contents will have a clear and colorless or grassy green and brown appearance.
 - (2) Fluids from the pleural space may have a pale yellow, serous appearance.
 - (3) Post-pyloric/small bowel contents can be bile-stained, light to dark yellow or greenish-brown.

continues on next page

- (4) Fasting stomach acid will have a pH of 5 or less.
 - (5) Fluid from the pleural space will have a pH of 7 or higher.
 - (6) A pH of 5 or less suggests that the tube is placed in the stomach. However, a pH of 6 or greater is not definitive of placement outside the stomach.
3. If the above suggests improper tube positioning, do not administer feeding or medication. Notify the Charge Nurse or Physician.
 4. When correct tube placement has been verified, flush tubing with at least 30 mL warm water (or prescribed amount).
 5. Discard disposable supplies in the designated containers.
 6. Clean reusable equipment according to the manufacturer’s instructions.
 7. Clean the overbed table and return it to its proper position.
 8. Reposition the bed covers. Make the resident comfortable.
 9. Place the call light within easy reach of the resident.
 10. Remove gloves and discard into designated container.
 11. Wash your hands.
 12. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Enteral Feeding Syringes, Sanitization of Reusable

Level II

Purpose

The purpose of this procedure is to guide the proper sanitizing of reusable enteral feeding syringes.

Preparation

Assemble equipment and supplies needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Towel;
3. Rectangular quart container with lid marked with resident's name and room number;
4. Sixty (60) mL enteral feeding syringe;
5. Bleach;
6. Two (2) mL syringe; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

In the absence of the manufacturer's specific care and maintenance instructions, sanitize reusable enteral feeding syringes as follows:

1. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves.
4. Rinse sixty (60) mL enteral feeding syringe with running water if the syringe had contact with stomach secretions or enteral feeding.
5. Fill a quart container with warm tap water to the level of the ridge on the outside lip of the container.
6. Draw 1.75 mL bleach into a two (2) mL syringe. Instill into water in a quart container.
7. Disassemble the enteral feeding syringe and the two (2) mL syringe. Place syringes in bleach solution in the container.
8. Place a lid on the container. Shake well (to sanitize the inside of the lid).
9. Let sit for at least 10 minutes.
10. Remove the lid. Turn wet side up.
11. Place syringe parts on top of the lid.
12. Discard the bleach solution.
13. Shake moisture off of the container and sanitized items.
14. Place syringe parts inside the container.
15. Place the lid on top. Do not seal completely.
16. When ready to use, rinse the syringe with fresh tap water.
17. Discard the syringe weekly or whenever obviously soiled or malfunctioning.

continues on next page

18. Clean and disinfect the surface used to clean the feeding syringe.
19. Remove gloves and discard into a designated container.
20. Wash hands.

Documentation

The person performing this procedure should document the following information in a designated record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The signature and title of the person recording the data.

Reporting

Report to your supervisor syringes that are hardening, swelling, discolored or have cracks.

Version	1.3 (H5MAPR0128)

Enteral Feedings – Safety Precautions

Level III

Purpose

To ensure the safe administration of enteral nutrition.

Preparation

1. All personnel responsible for preparing, storing and administering enteral nutrition formulas will be trained, qualified and competent in his or her responsibilities.
2. The facility will remain current in and follow accepted best practices in enteral nutrition.

General Guidelines

Preventing contamination

1. Maintain strict aseptic technique at all times when working with enteral nutrition systems and formulas.
 - a. Use only sterile or purified water for formula reconstitution, medication dilution and flushes before and after medication administration.
 - b. Use disposable gloves when handling or administering enteral formulas.
 - c. Sterile, liquid enteral nutrition formulas are preferred over powdered, reconstituted formulas.
 - d. Use closed enteral nutrition systems when possible.
2. Maintain strict adherence to storage conditions and timeframes:
 - a. Refrigerate prepared or opened ready to feed formulas and discard within 24 hours.
 - b. Store unopened liquid enteral formulas in temperature and light-controlled conditions (cool, away from direct sunlight).
 - c. Maintain inventory controls and discard any formula past the expiration date.
3. Maintain strict adherence to maximum hang times:
 - a. Powdered, reconstituted formula and formula with additives have a maximum infusion (hang) time of 4 hours.
 - b. Sterile formula in an open system has a maximum hang time of 8 hours.
 - c. Sterile formula in a closed system has a maximum hang time of 48 hours.
4. Administration set changes:
 - a. Change administration sets for open-system enteral feedings at least every 24 hours, or as specified by the manufacturer.
 - b. Change administration sets for closed-system enteral feedings according to manufacturer's instructions.

Promoting feeding tolerance

1. Administer only full strength formulas. Do not add water or dilute liquid or reconstituted enteral nutrition formulas.
2. Slow, continuous, pump-regulated feedings are generally better tolerated than gravity or syringe feedings. However, the resident's freedom of movement and potential for sleep disturbances due to pump alarms must be considered when determining the best method of administering enteral feedings.
3. Feeding pumps must be calibrated periodically to ensure that the pump delivers the prescribed volume within 10 percent accuracy.

continues on next page

Preventing errors in administration

1. Check the enteral nutrition label against the order before administration. Check the following information:
 - a. Resident name, ID and room number;
 - b. Type of formula;
 - c. Date and time formula was prepared;
 - d. Route of delivery;
 - e. Access site;
 - f. Method (pump, gravity, syringe); and
 - g. Rate of administration (mL/hour).
2. On the formula label document initials, date and time the formula was hung, and initial that the label was checked against the order.

Preventing misconnection errors

1. Ensure that all enteral formula labels indicate “Not for IV Use.”
2. Instruct all non-clinical staff, residents and visitors not to reconnect any tubing or lines, but instead to notify a nurse if tubing becomes disconnected.
3. Regularly inspect tubing for proper and secure connections.
4. Reconnect tubing only under good lighting. Trace tubing back to the source prior to reconnecting.
5. Do not modify or try to adapt connections to enteral devices.
6. Do not use IV pumps to administer enteral feedings.
7. Use only enteral tubing, syringes and devices with ENfit connectors.

Preventing aspiration

1. Check enteral tube placement every 4 hours and prior to feeding or administration of medication.
2. Check gastric residual volume as ordered.
3. Elevate the head of the bed (HOB) at least 30° during tube feeding and at least 1 hour after feeding. If elevating the HOB is medically contraindicated, use the reverse Trendelenburg position.
4. Monitor the resident for signs and symptoms of respiratory distress during enteral feedings and medication administration.
5. Minimize the use of sedatives.

Preventing skin breakdown

1. Keep the skin around exit site clean, dry and lubricated (as necessary).
2. Assess for leaking around the gastrostomy or jejunostomy frequently during the first 48 hours after tube insertion, and then with each feeding or medication administration.
3. Observe for signs of skin breakdown, infection and irritation.

Recognizing and reporting other complications

1. Symptoms of perforation of the stomach or small intestine/peritonitis:
 - a. Abdominal distention;
 - b. Abdominal pain;
 - c. Diminished bowel sounds;
 - d. Decreased appetite;
 - e. Fever;
 - f. Low urine output;
 - g. Nausea;

continues on next page

- h. Thirst; and
 - i. Vomiting.
2. Symptoms of esophageal complications (e.g., stricture, fistula, ulcers):
- a. Pain;
 - b. Difficulty swallowing; and
 - c. Difficulty breathing

Documentation

Document all assessments, findings and interventions in the medical record.

Reporting

Report unusual findings and/or signs of complications to the Physician.

Enteral Tube Feeding via Continuous Pump

Level III

Purpose

The purpose of this procedure is to provide a guideline for the use of a pump for enteral feedings.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.
4. Ensure that the equipment and devices are working properly by performing any calibrations or checks as instructed by the manufacturer or this facility.

General Guidelines

1. Use aseptic technique when preparing or administering enteral feedings.
2. Administer only full strength feeding tube formulas. Do not add water or dilute feeding solutions.
3. Check the enteral nutrition label against the order before administration. Check the following information:
 - a. Resident name, ID and room number;
 - b. Type of formula;
 - c. Date and time formula was prepared;
 - d. Route of delivery;
 - e. Access site;
 - f. Method (pump, gravity, syringe); and
 - g. Rate of administration (mL/hour).
4. Refrigerate formulas that have been reconstituted in advance and discard within 24 hours. Discard reconstituted formulas kept at room temperature within four hours.
5. Refer to facility procedures for hang times and administration set changes.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Enteral feeding pump;
4. Enteral feeding bag with clamp;
5. IV pole;
6. Sixty (60) mL enteral syringe (with transition adapter if necessary);
7. Prescribed enteral formula;
8. Clean container with fresh water;
9. pH strips;
10. Stethoscope; and
11. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves.
4. Position the head of the bed at 30° – 45° (semi-Fowler's position) for feeding, unless medically contraindicated.
5. Check the label on the enteral formula against the physician order.
6. Attach enteral feeding pump set to bag and prime tubing. Clamp tubing.
7. Clamp enteral tube. Remove the plug.
8. Verify placement of tube.
9. If anything suggests improper tube positioning, do not administer feeding or medication. Notify the Charge Nurse or Physician.
10. When correct tube placement has been verified, flush tubing with at least 30 mL warm water (or prescribed amount).
11. Remove the syringe and clamp tubing.

Initiate Feeding

1. Attach the primed administration set to enteral tube and unclamp tube.
2. Hang feeding bag on IV pole.
3. Connect the infusion pump, set rate, and press start.
4. Monitor resident for signs and symptoms of aspiration and/or feeding intolerance.
5. On the formula label document initials, date and time the formula was hung/administered, and initial that the label was checked against the order.
6. Place the wash cloth and towel in the soiled laundry container.
7. Discard disposable supplies in the designated containers.
8. Clean reusable equipment according to the manufacturer's instructions.
9. Clean the overbed table and return it to its proper position.
10. Reposition the bed covers. Make the resident comfortable.
11. Place the call light within easy reach of the resident.
12. Remove gloves and discard into designated container.
13. Wash your hands.
14. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. Verification of tube placement.
3. Amount and type of enteral feeding.
4. The average fluid intake per day.
5. The name and title of the individual(s) who performed the procedure.
6. All assessment data obtained during the procedure.

continues on next page

7. How the resident tolerated the procedure.
8. If the resident refused the procedure, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

Reporting

1. Report complications (e.g., diarrhea, gastric distention, respiratory distress) promptly to the supervisor and the attending physician.
2. Report negative consequences of tube use (e.g., agitation, depression, self-extubation, infections, etc.) to the supervisor and attending physician.
3. Notify the supervisor if the resident refuses the procedure.
4. Report other information in accordance with facility policy and professional standards of practice.

Enteral Tube Feeding via Gravity Bag

Level III

Purpose

The purpose of this procedure is to provide nourishment to the resident who is unable to obtain nourishment orally.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

General Guidelines

1. Use aseptic technique when preparing or administering enteral feedings.
2. Administer only full strength feeding tube formulas. Do not add water or dilute feeding solutions.
3. Check the enteral nutrition label against the order before administration. Check the following information:
 - a. Resident name, ID and room number;
 - b. Type of formula;
 - c. Date and time formula was prepared;
 - d. Route of delivery;
 - e. Access site;
 - f. Method (pump, gravity, syringe); and
 - g. Rate of administration (mL/hour).
4. Refrigerate formulas that have been reconstituted in advance and discard within 24 hours. Discard reconstituted formulas kept at room temperature within four hours.
5. Refer to facility procedures for hang times and administration set changes.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Enteral tube feeding bag with clamp;
4. IV pole;
5. Sixty (60) mL enteral syringe (with transition adapter if necessary);
6. Prescribed enteral formula;
7. Clean container with fresh water;
8. pH strips;
9. Stethoscope; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves.
4. Position the head of the bed at 30° – 45° (semi-Fowler's position) for feeding, unless medically contraindicated.
5. Check the order to verify the type, amount, method and rate of administration.
6. Pour prescribed amount of enteral feeding into enteral feeding bag and prime tubing. Clamp tubing.
7. Verify placement of feeding tube.
8. If anything suggests improper tube positioning, do not administer feeding or medication. Notify the Charge Nurse or Physician.
9. When correct tube placement has been verified, flush tubing with at least 30 mL warm water (or prescribed amount).
10. Remove the syringe and clamp tubing.

Initiate Feeding

1. Attach the primed tubing to enteral tube and unclamp enteral tube.
2. Hang feeding bag on IV pole approximately eighteen (18) inches above resident's head and allow feeding to flow by gravity.
3. Monitor resident for signs and symptoms of aspiration and/or feeding intolerance.
4. On the formula label document initials, date and time the formula was hung/administered, and initial that the label was checked against the order.
5. Unless otherwise ordered, follow the feeding with 30 – 60 mL of warm water.
6. Clamp enteral tube. Remove feeding bag tubing from enteral tube.
7. Instruct resident to remain in semi-Fowler's position for at least one (1) hour after feeding to prevent aspiration.
8. Place the wash cloth and towel in the soiled laundry container.
9. Discard disposable supplies in the designated containers.
10. Clean reusable equipment according to the manufacturer's instructions.
11. Clean the overbed table and return it to its proper position.
12. Reposition the bed covers. Make the resident comfortable.
13. Place the call light within easy reach of the resident.
14. Remove gloves and discard into designated container.
15. Wash your hands.
16. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

continues on next page

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. Verification of tube placement.
3. Amount and type of enteral feeding and amount of flush.
4. The name and title of the individual(s) who performed the procedure.
5. All assessment data obtained during the procedure.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Enteral Tube Feeding via Syringe (Bolus)

Level III

Purpose

The purpose of this procedure is to provide nutritional support to residents unable to obtain nourishment orally.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

General Guidelines

1. Use aseptic technique when preparing or administering enteral feedings.
2. Administer only full strength feeding tube formulas. Do not add water or dilute feeding solutions.
3. Check the enteral nutrition label against the order before administration. Check the following information:
 - a. Resident name, ID and room number;
 - b. Type of formula;
 - c. Date and time formula was prepared;
 - d. Route of delivery;
 - e. Access site;
 - f. Method (pump, gravity, syringe); and
 - g. Rate of administration (mL/hour).
4. Refrigerate formulas that have been reconstituted in advance and discard within 24 hours. Discard reconstituted formulas kept at room temperature within four hours.
5. Refer to facility procedures for hang times and administration set changes.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Enteral syringe (60 mL) (with transition adapter if necessary);
4. Prescribed enteral feeding;
5. Feeding syringe;
6. Stethoscope;
7. Sixty (60) mL water (room temperature); and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves.

continues on next page

4. Elevate head of bed 30° – 45° (semi-Fowler's position).
5. Check the order to verify the type, amount, method and rate of administration.
6. If feeding tube is not clamped, clamp tube and remove plug.
7. Verify placement of tube.
8. If anything suggests improper tube positioning, do not administer feeding or medication. Notify the Charge Nurse or Physician.
9. When correct tube placement has been verified, flush tubing with at least 30 mL warm water (or prescribed amount).
10. Remove the syringe and clamp tubing.

Initiate Feeding

1. Attach sixty (60) mL syringe (with transition adapter if necessary) to the tube and unclamp the tube. Elevate syringe approximately eighteen (18) inches above the resident's head.
2. Fill the syringe with prescribed amount of enteral feeding to be given. Unclamp the tube and allow feeding to flow by gravity.
3. Monitor resident for signs and symptoms of aspiration and/or feeding intolerance.
4. Unless otherwise ordered, follow the feeding with 30 – 60 mL of warm water.
5. Plug the end of tube and re-pin to the resident's gown.
6. Instruct resident to remain upright for approximately one (1) hour to prevent aspiration.
7. Place the wash cloth and towel in the soiled laundry container.
8. Discard disposable supplies in the designated containers.
9. Clean reusable equipment according to the manufacturer's instructions.
10. Clean the overbed table and return it to its proper position.
11. Reposition the bed covers. Make the resident comfortable.
12. Place the call light within easy reach of the resident.
13. Remove gloves and discard into designated container.
14. Wash your hands.
15. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. Verification of tube placement.
3. Amount of feeding and amount of water administered.
4. The name and title of the individual(s) who performed the procedure.
5. All assessment data obtained during the procedure.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Gastrostomy/Jejunostomy Site Care

Level III

Purpose

The purposes of this procedure are to promote cleanliness and to protect the gastrostomy or jejunostomy site from irritation, breakdown and infection.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Gauze pads;
3. Cotton-tipped applicators; and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash hands and dry thoroughly.
3. Wear clean gloves.
4. Using the gauze pads, soap and warm water, gently clean the area immediately surrounding the tube and continue working outward in a circular fashion. Be sure to clean under the bolster.
5. If the resident has a Button™, use a cotton-tipped applicator to clean the area and rotate the device once every day. (Note: Since residents fitted with the Button™ are allowed to bathe, a good time for this cleaning routine is during the bath.)
6. After cleaning, allow the site to air dry.
7. Unless otherwise indicated, do not place a dressing over the site. (Note: Heavy, taped dressings may promote skin problems.)
8. Assess the stoma site for signs of redness, pain or soreness, swelling, or drainage. Report any of these signs of infection immediately to your supervisor and the resident's physician.
9. If the stoma site has signs of irritation or infection, clean the area several times a day as described above in Steps 2 through 6. If the signs and symptoms persist, notify your supervisor and the resident's physician.
10. Discard disposable supplies in the designated containers.
11. Clean the overbed table and return it to its proper position.
12. Reposition the bed covers. Make the resident comfortable.
13. Place the call light within easy reach of the resident.
14. Remove gloves and discard into designated container.
15. Wash your hands.

continues on next page

16. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Report complications promptly to the supervisor and the attending physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Maintaining Patency of a Feeding Tube (Flushing)

Level III

Purpose

The purpose of this procedure is to maintain patency of a feeding tube.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

General Guidelines

For maintaining patency of a feeding tube:

1. Flush enteral feeding tubes every four (4) hours with 30 mL, or prescribed amount, of warm water during continuous feeding.
2. Flush enteral feeding tubes with 30 mL, or prescribed amount, of warm water before and after intermittent feedings.
3. Flush enteral feeding tubes with 15 mL, or prescribed amount, of warm purified water before and after administration of medications. If administering more than one medication, flush with 15mL, or prescribed amount, of warm water between each medication.
 - a. Use warm purified water for tube flushes in immunocompromised or critically ill residents, and before and after medication administration.
4. Flush with 30 mL, or prescribed amount, of warm water after checking gastric residual volume (GRV).

For opening a clogged feeding tube:

1. Use warm water for initial declogging efforts. Do not use cranberry juice or carbonated beverages.
2. If water does not unclog the tube, use a pancreatic enzyme solution, an enzyme declogging kit, or a mechanical device for clearing feeding tubes

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel;
3. Sixty (60) mL enteral syringe (with transition adapter if necessary);
4. Water;
5. Stethoscope; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Wear clean gloves.

continues on next page

4. Position resident in semi-Fowler's or higher position.
5. Confirm placement of tube.
6. For intermittent feeding, flush with warm water before and after the feeding.
7. When administering medication, flush with warm purified water before and after medication.
 - a. If administering more than one medication, flush the tube with 15 mL, or prescribed amount, of warm purified water between each medication.
8. Attach sixty (60) mL syringe without plunger to tube.
9. Unclamp tube and pour 30 mL (or amount ordered) warm water (tap or purified depending on the circumstances) into syringe.
10. Allow water to flow by gravity into feeding tube.
11. If the feeding tube is clogged:
 - a. Check the tubing for kinks.
 - b. Add 30 mL (or prescribed amount) warm water to the syringe.
 - c. With water in the syringe, apply a gentle back and forth motion with the plunger to try to dislodge the clog.
 - d. If the water flush does not resolve the clog:
 - (1) Crush one uncoated pancreatic enzyme tablet and mix with one 326 mg sodium bicarbonate tablet in 5mL water.
 - (2) Pour into the syringe and allow the mixture to flow into the feeding tube.
 - (3) Clamp tubing for 30 minutes.
 - (4) Attempt a water flush.
 - (5) If the clog is not cleared, remove the solution from the tube and repeat the above steps with a fresh mixture.
 - e. If the enzyme does not resolve the clog, use a commercial enzyme-containing declogging kit or mechanical declogging device following manufacturer's instructions.
 - f. When tube is unclogged, flush until clear and administer feeding or medication according to procedure.
12. Discard disposable supplies in the designated containers.
13. Clean reusable equipment according to the manufacturer's instructions.
14. Clean the overbed table and return it to its proper position.
15. Reposition the bed covers. Make the resident comfortable.
16. Place the call light within easy reach of the resident.
17. Remove gloves and discard into designated container.
18. Wash and dry your hands thoroughly.

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. Verification of tube placement.
3. Total amount used to flush tube.
4. The name and title of the individual(s) who performed the procedure.
5. All assessment data obtained during the procedure.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

continues on next page

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Nasogastric Tube Insertion and Care

Level III

Purpose

The purpose of this procedure is to provide a route for nourishment to the resident who is unable to obtain needed nourishment orally.

Preparation

1. Verify that there is a physician's order for the insertion of a nasogastric tube. Check the order for the following tube specifications:
 - a. Type of tube;
 - b. Size of tube;
 - c. Purpose of tube (decompression vs. feeding); and
 - d. Tube replacement guidelines.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.
4. Many varieties of tubes are available. Always read the manufacturer's recommendations for preparation guidelines and suggestions for insertion (i.e., some tubes are self-lubricating, others require water soluble lubricants).
5. Ensure that the device is working properly by performing any checks as instructed by the manufacturer or this facility. Inspect the tube for rough or torn edges or partially closed opening.
6. Never use a petroleum based lubricant.
7. Check the resident for any contraindications to a nasogastric tube, including:
 - a. Recent nasal surgery; or
 - b. Esophageal strictures or varices (or recent surgical correction of).
8. The interdisciplinary team will document the clinical necessity for the use of a nasogastric tube for longer than thirty (30) days.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Nasogastric tube as specified by physician;
2. Topical anesthesia (such as 2% viscous lidocaine or oral analgesic spray), as ordered;
3. Soap and water;
4. Towel or linen saver;
5. Tape (1/2 to 1 inch);
6. Water soluble lubricant;
7. Clean container with fresh water;
8. Ten (10) mL and sixty (60) mL enteral syringes (with transition adapter if necessary);
9. Stethoscope;
10. Cup of water with flexible straw (if resident is cognitively and physically able to swallow); and
11. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

Preparation

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Assist the resident to a sitting or high Fowler's position, as tolerated.
3. Measure the tube for the length to be inserted. Measure from the tip of the nose to the earlobe to the xiphoid process. Mark the measured length with a piece of tape.
4. Put on clean gloves.
5. Place a towel over the resident's chest.
6. Observe the resident's nostrils for air exchange and select a patent nostril for insertion of the nasogastric tube.
7. Read the product packaging to determine if the tube is self-lubricating. If the tube is self-lubricating, follow the manufacturer's instructions to activate the lubrication (usually by dipping the tube in water).
8. If the tube is not self-lubricating, lubricate the tip and the first four to six (4-6) inches of the tube with a water soluble lubricant. (**Note:** Never use petroleum based lubricants or occlude the opening of the tube with lubricant.)

Topical Anesthesia

1. Tilt the resident's head back and instill 10 mL of lidocaine into the patent nostril (or follow orders for alternate method of topical anesthesia). Ask the resident to sniff and swallow the lidocaine. Wait 5-10 minutes for full anesthetic effect before proceeding.

Tube Insertion

1. Tilt the resident's head back slightly.
2. Gently insert the tip of the tube into nostril and advance along the floor of the nose to the nasopharynx (10-20 cm).
 - a. The resident may gag. If gagging persists, examine the back of the throat for coiling.
 - b. If coiling is noted, pull the tube back until the tube is straight.
3. After the tube passes the nasopharynx, flex the resident's head onto the chest and allow the resident to rest for a moment.
4. Ask the resident to take sips of water (if able) and swallow.
5. Advance the tube 3-5 inches each time the resident swallows until the measured length is reached.
 - a. Do not force the tube. If resistance is met or if resident experiences respiratory distress, becomes cyanotic, or coughs persistently, remove the tube immediately.
 - b. Ask the resident to speak. If he or she cannot speak the tube may have passed through the vocal chords or lungs.

Verification of Placement

1. Verify placement of the feeding tube by obtaining an X-ray prior to initiating the first feeding.
2. Once placement has been confirmed, mark and measure the external length of the tube (from the exit site to the proximal end of the tube). This will be documented and referred to later to detect tube migration.

Skin Care and Tube Security

1. Clean the resident's skin with alcohol to remove surface oil.
2. Apply a skin protectant and anchor the tube securely with tape to the nose and cheek.
 - a. If the resident is confused or uncooperative, consider using a commercially available attachment device that adheres to the nose and holds the tube in place with an adjustable clip.

continues on next page

- b. Avoid pressure on the nostril.
3. Wrap a piece of tape around the tube (leaving a “tail”) or loop and secure with a rubber band. Pin tape or rubber band to the resident’s shirt or gown.

Final Steps

1. Place the towel in the soiled laundry container.
2. Discard disposable supplies in the designated containers.
3. Clean reusable equipment according to the manufacturer’s instructions.
4. Clean the overbed table and return it to its proper position.
5. Reposition the bed covers. Make the resident comfortable.
6. Place the call light within easy reach of the resident.
7. Remove gloves and discard into designated container.
8. Wash your hands.
9. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

Ongoing Care of the Resident and the Nasogastric Tube

1. Provide frequent nose and mouth care while tube is in place.
2. Check placement of tube according to facility protocol.
3. Flush tube according to flushing protocol.

Documentation

The person performing this procedure should record the following information in the resident’s medical record:

1. The date and time the procedure was performed.
2. The size and length of the nasogastric tube and the length of the external portion of the tube.
3. Verification of tube placement.
4. The name and title of the individual(s) who performed the procedure.
5. All assessment data obtained during the procedure.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.
8. The signature and title of the person recording the data.

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Nasogastric Tube Removal

Level III

Purpose

The purpose of this procedure is to remove nasogastric tube when a resident is able to obtain nourishment orally (planned removal) or when nasogastric tube is no longer functioning (unplanned removal).

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble equipment and supplies needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Soap and water;
2. Wash cloth and towel; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry hands thoroughly.
3. Wear clean gloves.
4. Assist the resident to a sitting or high-fowler's position.
5. Untape the tube from resident's nose and unpin tube from resident's gown.
6. Place a towel over the resident's chest.
7. Clamp tube.
8. Ask resident to inhale deeply and slowly exhale as the tube is being removed.
9. Gently and quickly remove the tube in one steady motion.
10. Discard tube in designated container.
11. Cleanse nasal area with soap and water. Pat dry with towel.
12. Place the wash cloth and towel in the soiled laundry container.
13. Discard disposable supplies in the designated containers.
14. Clean reusable equipment according to the manufacturer's instructions.
15. Clean the overbed table and return it to its proper position.
16. Reposition the bed covers. Make the resident comfortable.
17. Place the call light within easy reach of the resident.
18. Remove gloves and discard into designated container.
19. Wash your hands.
20. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them they may now enter the room.

continues on next page

Documentation

The person performing this procedure should record the following information in the resident's medical record:

1. The date and time the procedure was performed.
2. Reason the feeding tube was removed.
3. The name and title of the individual(s) who performed the procedure.
4. All assessment data obtained during the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Report complications promptly to the supervisor and the Attending Physician.
2. Notify the supervisor if the resident refuses the procedure.
3. Report other information in accordance with facility policy and professional standards of practice.

Ready to Use Enema (Cleansing or Oil)

Level II

Purpose

The purpose of this procedure is to promote defecation.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Prepackaged disposable enema;
2. Toilet tissue;
3. Wash basin;
4. Soap;
5. Towel;
6. Washcloth;
7. Bedpan;
8. Paper towels;
9. Bed protector (disposable or plastic);
10. Bath blanket/sheet, etc.;
11. Urinal (as necessary); and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Fill the wash basin one-half (1/2) full of warm water. Place the basin on the bedside stand or overbed table.
5. Remove the enema bottle from the package. Place the bottle into the basin of warm water. Do not immerse the top of the bottle into the water.
6. Adjust the resident's clothing to expose the buttocks. Cover the resident with a bath blanket or other protective covering.
7. Place the bed-protector under the resident's buttocks.
8. Assist the resident to turn on his/her left side. Bend the right knee toward his/her chest unless contraindicated by the resident's medical condition. (This is the Left Sims Position or Enema Position.)
9. Place the bedpan at the foot of the bed. Be sure that it is in easy reach.
10. Remove the enema bottle from the wash basin. Dry it off with a paper towel. Discard paper towel into designated container.
11. Remove the cap from the enema bottle. Put the cap on the bedside table.

continues on next page

12. Expose the buttocks. (Note: Grasp the bath blanket, or other covering, at the anal area. Lift it up and fold over the buttocks.)
13. Separate the buttocks so that you can see the anal area.
14. Gently insert the enema tip through the anus into the rectum.
15. Slowly squeeze the enema bottle until all the solution has been expelled from the bottle into the rectum. (Note: If the resident has the desire to defecate, cease the flow until the desire has passed.)
16. Remove the enema tip from the anus.
17. Encourage the resident to hold the solution as long as possible.
18. Assist the resident onto the bedpan. (Note: If the resident is unable to hold the solution, put the bedpan underneath the resident before giving the enema.)
19. Discard gloves into the designated container. Wash and dry your hands thoroughly.
20. Unless otherwise instructed, raise the back of the bed so that the resident will be in a near sitting position.
21. Place the toilet tissue within easy reach of the resident.
22. Provide the resident with as much privacy as possible. Place the call light within easy reach of the resident. Assure the resident that you will be near should he/she need assistance.
23. Remove the enema equipment while the resident is on the bedpan. Discard disposable items into the designated container. Clean and sanitize any reusable equipment and place in the designated storage area. Discard gloves into the designated container. Wash and dry your hands thoroughly.
24. If the resident is having trouble expelling the solution, notify your supervisor.
25. When you return to the resident, wash and dry your hands thoroughly. Put on gloves.
26. When the resident has expelled the solution, remove the bedpan. Check the results of the enema. Look for color, consistency, odor, amount, etc.
27. Collect a specimen, if ordered.
28. Empty the solution into the commode. Flush the commode. Clean and store the bedpan.
29. Fill the wash basin one-half (1/2) full of warm water. Take to the bedside. Inspect the resident's buttocks. Wash, rinse, and dry as necessary. Assist resident in washing his/her hands.
30. Remove the bed protector. Discard as indicated.
31. Remove the bath blanket, or other protective covering. Fold and store, or discard into the soiled linen container.
32. Return gown or pajamas to the appropriate position. Pull top covers back over resident.
33. Change linen as necessary. Discard dirty linen into designated container.
34. Discard disposable items into designated containers.
35. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
36. Reposition the bed covers. Make the resident comfortable.
37. Place the call light within easy reach of the resident.
38. Clean wash basin and return to designated storage area.
39. Clean the bedside stand.
40. Wash and dry your hands thoroughly.
41. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the enema was administered.
2. The name and title of the individual who administered the enema.

continues on next page

3. The type of enema and the amount of solution used.
4. The type of solution used (i.e., soapsuds, saline, or tap water).
5. All assessment data obtained during the procedure.
6. Results of enema (i.e., color, odor, blood, soft, hard, large or small amounts, if gas was expelled, etc.).
7. If a specimen was collected.
8. How the resident tolerated the procedure.
9. If the resident refused the procedure, the reason(s) why.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the enema.
2. Report other information in accordance with facility policy and professional standards of practice.

Rectal Tube with Connected Flatus Bag

Level II

Purpose

The purpose of this procedure is to relieve distention secondary to unexpelled flatus.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Disposable rectal tube with connected flatus bag;
2. Lubricant (if tubing is not prelubricated);
3. Adhesive tape;
4. Toilet tissue;
5. Wash basin;
6. Soap;
7. Towel;
8. Washcloth;
9. Paper towels;
10. Bed protector (disposable or plastic);
11. Bath blanket/sheet, etc.; and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Adjust the resident's clothing to expose the buttocks. Cover the resident with a bath blanket/sheet, etc.
5. Place the bed protector under the resident's buttocks.
6. Assist the resident to turn on his/her left side. Bend the right knee toward his/her chest unless contraindicated by the resident's medical condition. (This is the Left Sims Position or Enema Position.)
7. Lubricate the tip of the tubing about 3 to 4 inches. Be sure the tube is well lubricated. Check the opening of the tube to be sure that it is not plugged.
8. Expose the buttocks. (Note: Grasp the bath blanket or other protective covering at the anal area. Lift it up and fold over the buttocks.)
9. Separate the buttocks so that you can see the anal area.
10. Grasp the tubing about 5 to 6 inches from the end. Gently insert the enema tip 3 to 4 inches through the anus into the rectum. (Note: If you feel resistance or if the resident complains of pain, stop the procedure. Summon your supervisor.)

continues on next page

11. Tape the tubing to the resident's buttocks with a small piece of adhesive tape.
12. Leave the tubing in place 20 minutes or as instructed.
13. Discard gloves into the designated container. Wash and dry your hands thoroughly.
14. Provide the resident with as much privacy as possible. Place the call light within easy reach of the resident. Assure the resident that you will be near should he/she need assistance.
15. When you return to the resident, wash and dry your hands thoroughly. Put on gloves.
16. Observe the amount of flatus in the bag.
17. Remove adhesive tape and slowly withdraw the rectal tubing.
18. Fill the wash basin one-half (1/2) full of warm water. Take to the bedside. Inspect the resident's buttocks. Wash, rinse, and dry as necessary. Assist resident in washing his/her hands.
19. Remove the bed protector. Discard as indicated.
20. Remove the bath blanket/sheet, etc. Fold and store, or discard into the soiled linen container.
21. Return gown or pajamas to the appropriate position. Pull top covers back over resident.
22. Change linen as necessary. Discard dirty linen into designated container.
23. Discard disposable items into designated containers.
24. Clean and sanitize any reusable equipment and return to designated storage areas.
25. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
26. Reposition the bed covers. Make the resident comfortable.
27. Place the call light within easy reach of the resident.
28. Clean wash basin and return to designated storage area.
29. Clean the bedside stand.
30. Wash and dry your hands thoroughly.
31. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the rectal tube was administered.
2. The name and title of the individual who administered the rectal tube.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the rectal tube.
2. Report other information in accordance with facility policy and professional standards of practice.

Return Flow Enema (Harris Flush)

Level II

Purpose

The purpose of this procedure is to promote defecation.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Disposable bag, tubing, and clamp;
2. Lubricant;
3. Solution (500 ccs of warm water [105°F/40.5°C]);
4. Toilet tissue;
5. Wash basin;
6. Soap;
7. Towel;
8. Washcloth;
9. Graduated pitcher;
10. Bath thermometer;
11. Bedpan and cover;
12. Paper towels;
13. Bed protector (disposable or plastic);
14. Bath blanket/sheet, etc.;
15. Urinal (as necessary); and
16. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Adjust the resident's clothing to expose the buttocks. Cover the resident with a bath blanket/sheet, etc.
5. Place the bed protector under the resident's buttocks.
6. Assist the resident to turn on his/her left side. Bend the right knee toward his/her chest unless contraindicated by the resident's medical condition. (This is the Left Sims Position or Enema Position.)
7. Place the bedpan at the foot of the bed. Be sure that it is in easy reach.
8. Close the clamp on the enema tubing.
9. Fill the graduated container with 500 ccs of warm water (105°F or 40.5°C). Test the water with the bath thermometer.

continues on next page

10. Pour the water into the enema container.
11. Hold the tubing over the bedpan. Open the clamp on the enema container. Let a small amount of the solution run through the tubing into the bedpan to eliminate any air in the tubing. Close the clamp.
12. Lubricate the tip of the tubing about 3 to 4 inches. Be sure the tube is well lubricated. Check the opening of the tube to be sure that it is not plugged.
13. Expose the buttocks. (Note: Grasp the bath blanket or other protective covering at the anal area. Lift it up and fold over the buttocks.)
14. Separate the buttocks so that you can see the anal area.
15. Grasp the tubing about 4 to 5 inches from the end. Gently insert the enema tip 2 to 3 inches through the anus into the rectum. (Note: If you feel resistance or if the resident complains of pain, stop the procedure. Summon your supervisor.)
16. Raise the enema container about twelve (12) inches above the buttocks. (Note: Do not raise the container more than eighteen [18] inches.)
17. Open the clamp and allow 200 ccs of water to run into the rectum. Instruct the resident to breathe slowly through his/her mouth. (Note: This will help relax the resident.) If the resident complains of cramping, you may need to lower the container or clamp the tubing for a moment until the discomfort eases.
18. Lower the enema bag below the bed frame and allow the water to run back into the enema bag. (Note: Do not remove the tubing.)
19. Repeat steps 16-18 for 10 to 20 minutes or as instructed.
20. Observe the amount of flatus that the resident expels as the water runs back into the bag.
21. Slowly, withdraw the rectal tubing.
22. To prevent contamination, wrap the end of the tubing in a paper towel. Place the tubing into the enema container. Place the enema container on a paper towel.
23. Assist the resident onto the bedpan.
24. Discard gloves into the designated container. Wash and dry your hands thoroughly.
25. Unless otherwise instructed, raise the back of the bed so that the resident will be in a near sitting position.
26. Place the toilet tissue within easy reach of the resident.
27. Provide the resident with as much privacy as possible. Place the call light within easy reach of the resident. Assure the resident that you will be near should he/she need assistance.
28. Remove the enema equipment while the resident is on the bedpan. Discard disposable items into the designated container. Clean and sanitize any reusable equipment and place in the designated storage area. Discard gloves into the designated container. Wash and dry your hands thoroughly.
29. When you return to the resident, wash and dry your hands thoroughly. Put on gloves.
30. When the resident has finished, remove the bedpan. Check the results of the enema. Look for color, consistency, odor, amount, etc.
31. Collect a specimen, if ordered.
32. Empty the solution into the commode. Flush the commode. Clean and store the bedpan.
33. Fill the wash basin one-half (1/2) full of warm water. Take to the bedside. Inspect the resident's buttocks. Wash, rinse, and dry as necessary. Assist resident in washing his/her hands.
34. Remove the bed protector. Discard as indicated.
35. Remove the bath blanket/sheet. Fold and store, or discard into the soiled linen container.
36. Return gown or pajamas to the appropriate position. Pull top covers back over resident.
37. Change linen as necessary. Discard dirty linen into designated container.
38. Discard disposable items into designated containers.

continues on next page

39. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
40. Reposition the bed covers. Make the resident comfortable.
41. Place the call light within easy reach of the resident.
42. Clean wash basin and return to designated storage area.
43. Clean the bedside stand.
44. Wash and dry your hands thoroughly.
45. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the enema was administered.
2. The name and title of the individual who administered the enema.
3. The type of enema and the amount of solution used.
4. All assessment data obtained during the procedure.
5. Results of enema (i.e., color, odor, blood, soft, hard, large or small amounts, if gas was expelled, etc.).
6. If a specimen was collected.
7. How the resident tolerated the procedure.
8. If the resident refused the procedure, the reason(s) why.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the enema.
2. Report other information in accordance with facility policy and professional standards of practice.

Fever/Septicemia – Clinical Protocol

Assessment and Recognition

1. A nurse will assess a resident with a suspected infection and will document related findings. Assessment data will include:
 - a. Vital signs, including respiratory rate and character of respirations (shallow, labored, rapid);
 - b. Onset (e.g., rapid, gradual) and pattern (e.g., continuous, intermittent) of fever;
 - c. Presence of shaking chills;
 - d. How well the resident is eating and drinking;
 - e. Any concurrent or related abnormal findings or symptoms (for example, cough, dysuria, or warmth and erythema surrounding a wound, etc.);
 - f. Whether antibiotics or antipyretics have been administered;
 - g. Any recent laboratory or diagnostic findings;
 - h. Current diagnoses and medications;
 - i. Recent history of fever before current illness started;
 - j. Known risk factors for recurrent infection or fever (for example, indwelling devices, recent hospitalization for pneumonia, known urinary tract obstruction, immunosuppression due to cancer-related radiation or chemotherapy, etc.); and
 - k. Description of any new or worsening decline in functional status, including confusion, incontinence, falling, decreased mobility, reduced food intake or lack of cooperation with staff.
2. The nurse will report findings to the physician or provider. As needed, the physician or provider will assess the resident to verify or clarify such findings, especially if the diagnosis of infection or source of infection is unclear.
3. The physician will help identify individuals with a recent history of fever and/or infection, and will help identify those at risk for infections or fever.
4. The nurse will discuss with the physician or provider whether a temperature elevation or temperature pattern constitutes a fever, and whether the presence of a fever indicates an infection.
 - a. “Normal” body temperature may range up to 99.5° Fahrenheit(F)/37.5°Celsius (C).
 - b. Daily temperature can vary normally by as much as 0.9° Fahrenheit/0.5° Celsius.
 - c. Fever often – but not always – indicates the presence of infection. It can be caused by other things such as inflammatory and rheumatologic disorders and some medications.
 - d. Relatively sensitive temperature predictors of infection include:
 - (1) an increased temperature of at least 2 degrees F (1.1 degrees C) over baseline; or
 - (2) a single temperature reading above 100°F (37.8°C); or
 - (3) two or more oral temperature readings above 99°F (37.2°C); or
 - (4) rectal temperature readings above 99.5°F (37.5°C).
5. The nurse will identify, document, and report to the physician or provider any evidence of possible infectious complications such as abscess, sepsis, or acute respiratory failure.

Cause Identification

1. Nursing staff will collaborate with the physician or provider to try to identify causes of fever and infection.

continues on next page

2. There are noninfectious causes of fever including rheumatologic and immunologic disorders, medication-related fever, and brainstem stroke.
3. Diagnostic tests should be ordered when they add to an understanding of the condition or are likely to change the treatment strategy. When indicated, appropriate tests may include:
 - a. CBC, including WBC count with differential;
 - b. Urinalysis or urine culture;
 - c. Pulse oximetry and/or chest X-ray for pneumonia evaluation;
 - d. Nasopharyngeal wash or swab samples of the throat and nasopharynx for rapid influenza-A and other virus detection;
 - e. Skin or lesion scraping for culture or viral antigen studies, or examination; or
 - f. Stool specimens for *C. difficile* toxin assay or other enteropathogens.
4. Test results, including positive cultures, do not necessarily indicate that an infection is present. The presence of infection is determined by clinical signs and symptoms that are consistent with identified criteria for infection and may be confirmed by test results.
5. Even if an extensive workup is not appropriate (for example, because of advance directives), a systematic review of the differential diagnosis of likely causes may be appropriate, based on existing information.
6. If causes are not apparent or readily diagnosed on clinical grounds, an additional workup may be appropriate. If an additional workup is not ordered under these circumstances, the staff and practitioner should collaborate to identify and document reasons for not doing so.

Management

1. Nursing staff will implement the physician or provider's orders and general nursing measures for comfort, as indicated.
2. Nursing staff will collaborate with the physician or provider to distinguish individuals whose condition can be managed in the facility without hospital transfer from those requiring hospital transfers.
3. The physician and staff will collaborate to identify individuals who can be managed in the facility without hospital transfer.
 - a. Many individuals with infections, with or without fever, do not need hospitalization. Temperature level, degree of WBC count elevation, or pulse oximetry results alone do not indicate the need to hospitalize, but significantly unstable vital signs and respiratory distress with respirations above 26 per minute may indicate possible need for hospitalization.
4. The physician or provider will prescribe antibiotics judiciously, following CDC recommendations and facility policies regarding antibiotic stewardship, and will promote treatment for the shortest possible time (consistent with the complexity of the infection and related complications).
5. The physician will identify when a resident/patient can be switched from intravenous antibiotics to intramuscular or oral antibiotics based on such factors as the site and severity of the infection and the individual's overall medical stability.
6. The physician will address noninfectious causes of fever; for example, by stopping medications associated with drug fever, treating other underlying causes such as rheumatologic or immunologic disorders, or identifying uncorrectable causes such as central nervous system impairment due to a stroke.

continues on next page

Monitoring and Follow-Up

1. The physician and nursing staff will evaluate the progress of individuals with fever and/or infection until the symptoms resolve.
2. Nursing staff and physician will monitor for other complications of infection, fever, or sepsis (for example, anorexia, fluid and electrolyte imbalance, or delirium).
3. The nurses will communicate with the physician or provider to identify whether the resident needs any special monitoring, precautions, or interventions (for example, contact or airborne precautions).
4. The nursing staff will monitor, document, and report complications related to antibiotic treatment, such as diarrhea and colitis.

Version	2.0 (H5MACL0018)

Infections – Clinical Protocol

Assessment and Recognition

1. The physician or provider will help identify individuals who have had a recent infection or who are at high risk for developing an infection.
2. Infection may be suspected based on clinical signs and symptoms and/or temperature.
3. When a resident is suspected of having an infection (for example, because of an abrupt change in function, appetite, mental status, etc.), nursing staff will obtain a complete set of vital signs (temperature, heart rate, blood pressure, and respiratory rate) and will identify, report and document specific details of symptoms and physical findings.
4. Nursing staff will notify the physician or provider of all pertinent details about the resident's condition.
5. The nursing staff and physician or provider will identify possible complications of infections such as sepsis and delirium.

Cause Identification

1. Based on the preceding information, the physician or provider and staff will discuss and determine whether an infection exists or is likely, whether additional evaluations or testing is indicated, and whether other active conditions related to an infection (for example, urinary retention or COPD) also need to be managed simultaneously.
2. Generally, a workup should focus primarily on low-risk tests that have a reasonable diagnostic yield and are likely to improve resident management; for example, in cases of unusual clinical presentations, where the resident fails to respond to initial therapy, or prolonged microbial therapy is being considered. Testing (for example, urine or wound cultures) may or may not add to the information provided by the clinical assessment.
3. Based on the overall clinical picture, including the severity of the current illness, the physician or provider will help the staff address the following issues:
 - a. Whether an infection is present;
 - b. Whether complications of an infection are present;
 - c. Whether the resident is taking medications that could be problematic while an infection is present (for example, anticoagulants that interact with antibiotics or medications that affect appetite or can cause fluid loss or sedation); and
 - d. Whether hospitalization might be indicated to evaluate or treat the individual.
 - (1) Elevated temperature and WBC count are not necessarily primary indicators of the severity of the illness or the need for hospitalization.
 - (2) If hospitalization is contemplated, the decision should consider the resident's wishes and limitations on care expressed in advance directives.
4. The physician or provider and staff will identify infection transmission risks and (in conjunction with the Infection Preventionist) will implement relevant precautions.

continues on next page

Treatment/Management

1. Based on review of the clinical situation, pertinent lab and diagnostic tests, and any resident medication allergies, the physician or provider and staff will identify whether antibiotics are warranted or whether those that have already been started should continue or change.
2. The staff and physician or provider will identify and document when limited or no antibiotic treatment is indicated because of resident or substitute decision-maker choices declining aggressive or life-sustaining medical interventions.
3. With the physician or provider's guidance, the staff will provide supportive measures as needed, such as supplemental fluids, oxygen, holding or tapering problematic medications, additional assistance with activities of daily living (ADLs), etc.

Monitoring and Follow-Up

1. The nursing staff and physician or provider will monitor the progress of a resident with an infection until it is resolved (i.e., no further significant clinical signs or symptoms).
2. The nursing staff will evaluate and report to the physician or provider at least weekly until the individual is stable or improving, and more often if the individual is not improving as anticipated or is declining unexpectedly. In cases of more severe or prolonged infections, the physician or provider and staff will communicate more frequently if needed.
3. The physician or provider will determine whether any antibiotics should be started, extended, changed, or discontinued.
4. The physician or provider will manage complications such as abscess, sepsis, and delirium.
 - a. If an initial course of antibiotics does not resolve an infection, the physician or provider will review the situation in detail and may need to examine the individual before prescribing a continuation or change in antibiotics.
5. If the resident has been receiving parenteral (intravenous or intramuscular) antibiotics, the physician or provider will consider changing to oral antibiotics once the individual has been afebrile and asymptomatic for at least 48 hours, or will justify continuing parenteral antibiotics (for example, a complicated infection, individual still having significant systemic symptoms, recurrent infection, etc.).
6. The physician or provider will evaluate the duration of any antibiotic treatment and will identify whether antibiotics can be stopped (for example, if an individual with an uncomplicated infection is afebrile and asymptomatic for at least 48 hours).
 - a. In many cases, standard 7- or 10-day durations of antibiotics are only approximations and may be either longer or shorter than the patient actually needs.
7. The physician or provider will identify and address possible complications of antibiotic treatment including adverse drug reactions, allergic reactions, drug interactions, and antibiotic-related colitis or diarrhea.
 - a. If such complications occur, the physician or provider will reassess the situation and identify whether additional treatment is warranted and whether antibiotics should be modified or stopped to address the complications.

Antibiotic Stewardship

Policy Statement

Antibiotics will be prescribed and administered to residents under the guidance of the facility's antibiotic stewardship program.

Policy Interpretation and Implementation

1. The purpose of our antibiotic stewardship program is to monitor the use of antibiotics in our residents.
2. Orientation, training and education of staff will emphasize the importance of antibiotic stewardship and will include how inappropriate use of antibiotics affects individual residents and the overall community.
3. Training and education will include emphasis on the relationship between antibiotic use and:
 - a. gastrointestinal disorders;
 - b. opportunistic infections (e.g., *C. difficile*, *Candida albicans*, etc.);
 - c. medication interactions; and
 - d. the evolution of drug-resistant pathogens.
4. If an antibiotic is indicated, prescribers will provide complete antibiotic orders including the following elements:
 - a. Drug name;
 - b. Dose;
 - c. Frequency of administration;
 - d. Duration of treatment:
 - (1) Start and stop date; or
 - (2) Number of days of therapy;
 - e. Route of administration; and
 - f. Indications for use.
5. When a resident is admitted from an emergency department, acute care facility, or other care facility, the admitting nurse will review discharge and transfer paperwork for current antibiotic/anti-infective orders.
6. Discharge or transfer medical records must include all of the above drug and dosing elements.
7. When a resident is discharged home, the nurse will review complete antibiotic orders with the resident, including:
 - a. the reason for the antibiotic;
 - b. how to take the antibiotic, including all dosing essentials;
 - c. possible side effects;
 - d. the importance of taking the antibiotic until the prescribed end-date;
 - e. the date his/her next doctor's appointment should be scheduled; and
 - f. drug monograph as provided by the dispensing pharmacy or other approved drug information resource, when discharging the resident with the antibiotic.
8. When a nurse calls a physician/prescriber to communicate a suspected infection, he or she will have the following information available:
 - a. Signs and symptoms;

continues on next page

- b. When symptoms were first observed;
 - c. Resident’s hydration status;
 - d. Current medication list;
 - e. Allergy information;
 - f. Infection type;
 - g. Any orders for warfarin and results of last INR;
 - h. Last creatinine clearance or serum creatinine, if available; and
 - i. Time of the last antibiotic dose.
9. When an interacting antibiotic is to be administered concomitantly with warfarin, an INR will be ordered within three days. When results are returned:
 - a. INR will be communicated to prescriber as soon as received;
 - b. the appropriate dose of warfarin will be confirmed;
 - c. any changes in warfarin orders will be communicated to the pharmacy; and
 - d. the next scheduled INR will be ordered.
 10. When antibiotics are prescribed over the phone, the primary care practitioner will assess the resident within 72 hours of the telephone order.
 11. When a culture and sensitivity (C&S) is ordered lab results and the current clinical situation will be communicated to the prescriber as soon as available to determine if antibiotic therapy should be started, continued, modified, or discontinued.
 12. Before a nurse removes an antibiotic from the facility emergency supply of medication, he or she will check for the right drug, right strength, allergy information and use of warfarin, along with the following:
 - a. The nurse will contact the pharmacist if not familiar with the antibiotic dose or drug-drug interactions;
 - b. The pharmacy removal slip for the dose(s) removed will be completed; and
 - c. As soon as clinically appropriate, the prescriber will be asked to review converting parenteral antibiotics to an oral formulation.

Antibiotic Stewardship – Orders for Antibiotics

Antibiotics will be prescribed and administered to residents under the guidance of the facility's antibiotic stewardship program and in conjunction with the facility's general policy for medication utilization and prescribing.

Policy Interpretation and Implementation

1. Prior to calling a physician/prescriber to communicate a suspected infection, the nurse will obtain and have the following information available:
 - a. Clinical signs and symptoms of suspected infection (based on approved definitions of infection);
 - b. A history of the present illness;
 - c. Resident's hydration status;
 - d. Current medication list;
 - e. Allergy information;
 - f. Any orders for warfarin and results of last INR;
 - g. Last creatinine clearance or serum creatinine, if available; and
 - h. Time of the last antibiotic dose.
2. If an antibiotic is indicated, prescribers will provide complete antibiotic orders including the following elements:
 - a. Drug name;
 - b. Dose;
 - c. Frequency of administration;
 - d. Duration of treatment:
 - (1) Start and stop date; or
 - (2) Number of days of therapy;
 - e. Route of administration; and
 - f. Indications for use.
3. Appropriate indications for use of antibiotics include:
 - a. criteria met for clinical definition of active infection or suspected sepsis; and
 - b. pathogen susceptibility, based on culture and sensitivity, to antimicrobial (or therapy begun while culture is pending).
4. Empirical use of an antibiotic based on clinical criteria of suspected sepsis may be appropriate. The staff and practitioner will document the specific criteria that support the suspicion in the resident's clinical record.
5. If a resident is admitted from an emergency department, acute care facility, or other care facility, the admitting nurse will review discharge and transfer paperwork for current antibiotic/anti-infective orders. Discharge or transfer medical records must include all of the above drug and dosing elements.
6. When antibiotics are prescribed over the phone, the primary care practitioner will assess the resident within 72 hours of the telephone order.

continues on next page

7. When a culture and sensitivity (C&S) is ordered, it will be completed, and:
 - a. lab results and the current clinical situation will be communicated to the prescriber as soon as available to determine if antibiotic therapy should be started, continued, modified, or discontinued.
8. As soon as clinically appropriate, the prescriber will be asked to review converting parenteral antibiotics to an oral formulation.
9. When a resident is discharged home, the nurse will review complete antibiotic orders with the resident, including:
 - a. the reason for the antibiotic;
 - b. how to take the antibiotic, including all dosing essentials;
 - c. possible side effects;
 - d. the importance of taking the antibiotic until the prescribed end-date;
 - e. the date their next doctor’s appointment should be scheduled; and
 - f. drug monograph as provided by the dispensing pharmacy or other approved drug information resource, when discharging the resident with the antibiotic.
10. Before a nurse removes an antibiotic from the emergency supply of medication, he or she will check for the right drug, right strength, allergy information and use of warfarin, along with the following:
 - a. The nurse will contact the pharmacist if not familiar with the antibiotic dose or drug-drug interactions;
 - b. The pharmacy removal slip for the dose(s) removed will be completed; and
 - c. The use will be reported to the infection preventionist.

Antibiotic Stewardship – Review and Surveillance of Antibiotic Use and Outcomes

Policy Statement

Antibiotic usage and outcome data will be collected and documented using a facility-approved antibiotic surveillance tracking form. The data will be used to guide decisions for improvement of individual resident antibiotic prescribing practices and facility-wide antibiotic stewardship.

Policy Interpretation and Implementation

1. As part of the facility antibiotic stewardship program, all clinical infections treated with antibiotics will undergo review by the infection preventionist, or designee.
2. The IP, or designee, will review antibiotic utilization as part of the antibiotic stewardship program and identify specific situations that are not consistent with the appropriate use of antibiotics.
 - a. Therapy may require further review and possible changes if:
 - (1) the organism is not susceptible to antibiotic chosen;
 - (2) the organism is susceptible to narrower spectrum antibiotic;
 - (3) therapy was ordered for prolonged surgical prophylaxis; or
 - (4) therapy was started awaiting culture, but culture results and clinical findings do not indicate continued need for antibiotics.
3. At the conclusion of the review, the provider will be notified of the review findings.
4. All resident antibiotic regimens will be documented on the facility-approved antibiotic surveillance tracking form. The information gathered will include:
 - a. resident name and medical record number;
 - b. unit and room number;
 - c. date symptoms appeared;
 - d. name of antibiotic (see approved surveillance list);
 - e. start date of antibiotic;
 - f. pathogen identified (see approved surveillance list);
 - g. site of infection;
 - h. date of culture;
 - i. stop date;
 - j. total days of therapy;
 - k. outcome; and
 - l. adverse events.

Antibiotic Stewardship – Staff and Clinician Training and Roles

The facility will educate and train staff and practitioners about the facility antibiotic stewardship program, including appropriate prescribing, monitoring, and surveillance of antibiotic use and outcomes.

Policy Interpretation and Implementation

Nursing Assistants

1. Nursing assistants and other unlicensed staff will be trained and in-serviced on:
 - a. recognizing signs and symptoms of infection that should be reported to the nurse; and
 - b. how to report resident changes of condition to the nurse (e.g., using tools such as INTERACT Stop and Watch Early Warning Tool).

Nursing and Direct Care Licensed Staff

1. Nurses will receive initial orientation and ongoing training on:
 - a. the facility's antibiotic stewardship program, including the need for judicious use of antibiotics;
 - b. common clinical conditions and associated pathogens treated at this facility;
 - c. how to utilize the standardized assessment and communication tool for residents suspected of having an infection;
 - d. how to access the list of antimicrobial agents available through the pharmacy formulary;
 - e. how to communicate with residents and family about the need for appropriate use of antibiotics;
 - f. specific information that should be reported to the physician or provider upon identifying signs and symptoms of possible infection; and
 - g. specific information that should be obtained when an order for an antibiotic is received.

Director of Nursing (DON) and Infection Preventionist (IP)

1. Administrative and management personnel with clinical oversight responsibilities will receive initial orientation and ongoing training on:
 - a. the facility's antibiotic stewardship program;
 - b. the rationale for judicious use of antibiotics;
 - c. common clinical conditions and associated pathogens treated at this facility;
 - d. how to access the current facility antibiogram, if applicable;
 - e. how to access the list of antimicrobial agents available through the pharmacy formulary;
 - f. how to use surveillance tools to monitor infections rates, antibiotic usage patterns and outcomes;
 - g. how to report notifiable infections when applicable;
 - h. how and when to gather data to present to the infection prevention and control committee (IPCC) for scheduled meetings; and
 - i. individual roles and responsibilities in maintaining antibiotic stewardship.
2. The DON will monitor individual resident antibiotic regimens, including:
 - a. reviewing clinical documentation supporting antibiotic orders; and
 - b. compliance with start/stop dates and/or days of therapy.

continues on next page

3. The IP will audit and the DON will provide feedback to providers on antibiotic prescribing practices.
4. The IP will monitor over time and report to the IPCC:
 - a. measures of antibiotic use (new antibiotic starts/1000 resident days AND days of therapy/1000 resident days);
 - b. antibiotic susceptibility patterns (antibiogram data for specific timeframe); and
 - c. negative outcomes or events related to antibiotic use, for example:
 - (1) *C. difficile* infections;
 - (2) adverse drug events; and
 - (3) antibiotic resistance rates.
5. The IP will obtain, and the DON will provide to healthcare practitioners, educational resources and materials about antibiotic resistance and opportunities for improved antibiotic use.
6. The IP and DON will participate in IPCC meetings on a regular basis.

Consultant Pharmacist

1. During the drug regimen review, the consultant pharmacist will identify, and flag, orders for antibiotics that are not consistent with antibiotic stewardship practices.
2. The CP will review the microbiology culture data (antibiogram) and share with the providers to help guide antibiotic selection.
3. The CP will provide the facility with the most current medication formulary.
4. The CP will participate in IPCC meetings on a regular basis.

Clostridium Difficile

Policy Statement

Measures are taken to prevent the occurrence of *Clostridium difficile* infections (CDI) among residents. Precautions are taken while caring for residents with *C. difficile* to prevent transmission to others residents.

Policy Interpretation and Implementation

1. Clostridium difficile infection is suspected in residents with acute, unexplained onset of diarrhea (three or more unformed stools within 24 hours).
2. Residents considered at high risk of developing symptoms associated with *C. difficile* include those with:
 - a. advancing age;
 - b. gastrointestinal manipulation (especially nasogastric tube insertion);
 - c. previous confirmed infection with *C. difficile*; and
 - d. antibiotic or anti-neoplastic therapy.
3. The primary reservoirs for *C. difficile* are infected people and surfaces. Spores can persist on resident-care items and surfaces for several months and are resistant to some common cleaning and disinfection methods.
4. *C. difficile* is transmitted via the fecal-oral route. Therefore, any resident-care activity that involves contact with the resident's mouth when hands or instruments are contaminated may provide an opportunity for transmission, for example:
 - a. oral care/suctioning;
 - b. administration of tube feedings;
 - c. administration of oral medications; and
 - d. insertion of a nasogastric tube.
5. Steps toward prevention and early intervention include:
 - a. ongoing surveillance of CDI;
 - b. increasing awareness of symptoms and risk factors among staff, residents and visitors;
 - c. considering *C. difficile* in differential diagnoses, especially in residents with symptoms or risk factors;
 - d. frequent hand washing with soap and water by staff and residents;
 - e. wearing gloves when handling feces or articles contaminated with feces;
 - f. disinfection of items with potential fecal soiling (e.g., bedpans, commode chairs, bed rails, etc.) using a disinfecting agent recommended for *C. difficile* (e.g., household bleach and water solution or an EPA registered germicidal agent effective against *C. difficile* spores); and
 - g. removal of environmental sources of *C. difficile* (i.e., replacement of electronic thermometers with disposables).

continues on next page

6. Stool specimens for testing are:
 - a. performed on unformed stool only (unless ileus is suspected);
 - b. submitted in a clean, leak-proof container;
 - c. transported to the laboratory as soon as possible;
 - d. stored at 2°C to 8°C for up to 24 hours, or freeze at -70°C for >24 hour storage times (if timely submission to the laboratory is not possible); and
 - e. not submitted from residents receiving laxatives.
7. Testing of asymptomatic residents and of residents who have responded to therapy is not done routinely.
8. Repeat testing (after initial negative result) is not performed routinely.
9. Residents with diarrhea associated with *C. difficile* (i.e., residents who are colonized and symptomatic) are placed on contact precautions.
10. Residents with diarrhea and suspected CDI are placed on contact precautions while awaiting laboratory results.
11. Residents who are colonized with *C. difficile* but are asymptomatic do not require contact precautions.
12. Residents who are asymptomatic (diarrhea free) for 48 hours can be removed from precautions.
13. Residents with CDI are placed in a private room if available. If a private room is not available, residents will be cohorted with a dedicated commode for each resident.
14. When caring for residents with CDI, staff is to maintain vigilant hand hygiene. Hand washing with soap and water is superior to ABHR for the mechanical removal of *C. difficile* spores from hands.
15. Enhanced infection control measures may be used on units with high rates of *C. difficile* infection, including:
 - a. universal glove use;
 - b. enhanced environmental cleaning;
 - c. reduced sharing of or dedicated medical equipment; and
 - d. staff cohorting.
16. Environmental cleaning in rooms of residents with CDI is done with a disinfecting agent recommended for *C. difficile* (e.g., household bleach and water solution or an EPA registered germicidal agent effective against *C. difficile* spores).
17. Residents with diarrhea are monitored for signs and symptoms of dehydration.
18. Surveillance and reporting of confirmed CDI is conducted by the infection preventionist.

Equipment and Supplies Used During Isolation

Policy Statement

Appropriate infection prevention and control equipment and supplies are obtained, stored and used in accordance with current guidelines and manufacturer instructions.

Policy Interpretation and Implementation

1. All equipment and supplies needed to implement transmission-based (isolation) precautions are obtained from an approved vendor.
2. Infection prevention and control supplies are stored and maintained in accordance with current guidelines and manufacturer’s recommendations.
3. The infection preventionist (or designee) oversees the availability and inventory of infection prevention and control supplies.
4. The nursing department will notify environmental services when equipment used to care for a resident needs to be sanitized.
 - a. Personal protective equipment (i.e., gloves, gowns, etc.) are worn when handling or transporting resident-care equipment and supplies that are visibly soiled or have been in contact with blood or body fluids.
 - b. Environmental services staff is responsible for cleaning and sanitizing equipment before it is returned to central supply or to designated storage areas.

Healthcare-Associated Infections, Identifying

Policy Statement

The facility shall attempt to identify and distinguish healthcare-associated infections from those acquired in the community.

Policy Interpretation and Implementation

1. Healthcare-associated infections (HAIs) are those that are acquired during the delivery of healthcare across settings, in contrast to those that were acquired prior to entering the healthcare setting but may persist after admission to the facility.
2. The goals of determining healthcare-associated infections are:
 - a. to identify and correct breaches in infection control practices that may have contributed to the spread of a healthcare-associated infection;
 - b. to prevent the further spread of infection (resident-to-resident, staff-to resident) through the initiation of appropriate isolation precautions where warranted; and
 - c. to identify, treat and report epidemiologically important organisms (e.g., *C. difficile*, MDROs) that have a high risk of transmission, severity of disease, and/or are difficult to treat.
3. When an infection is identified the infection preventionist will determine whether it meets the criteria of infection for surveillance purposes and/or a healthcare-associated infection. This will be based upon standardized, published definitions of infections for surveillance and healthcare-associated infections.
4. The infection preventionist will report surveillance information to the infection control committee and the quality assurance and performance improvement committee performing infection control oversight functions. The committee will review the reports and identify trends, patterns, or problems that might contribute to the development of healthcare-associated infections.
5. The facility has established procedures and forms to perform and document surveillance. Targeted surveillance and reporting of certain healthcare-associated infections may be conducted through the National Health Safety Network using NHSN protocols and forms.

Influenza Outbreak

Policy Statement

This facility follows current guidelines and recommendations for managing influenza outbreak in the facility.

Policy Interpretation and Implementation

Surveillance During Influenza Outbreak

1. The infection preventionist conducts active (daily) surveillance for new respiratory illness and reports influenza activity in the facility.
2. The infection preventionist maintains communication and collaborates with local and state health authorities.

Influenza Outbreak Precautions

1. An influenza outbreak is declared when two cases of laboratory-confirmed influenza are identified within 24 hours of each other among residents in the same unit.
2. Contact and droplet precautions are implemented during care of residents with suspected or confirmed cases of influenza, in addition to standard precautions used with all residents regardless of symptoms.
3. Contact and droplet precautions are continued for seven (7) days after illness onset or until 24 hours after the resolution of fever and respiratory symptoms, whichever is longer. Precautions may be continued for longer periods based on clinical judgment.
4. Residents with suspected or confirmed influenza are asked to wear face masks when not in their rooms.
5. Residents with confirmed influenza may be cohorted.
6. Admission to affected units may be closed temporarily.
7. Information about residents with suspected, probable, or confirmed influenza is communicated to appropriate personnel before transferring them to other departments in the facility (e.g., radiology, laboratory) or to other facilities.
8. Residents are discharged from care when clinically appropriate, not based on the period of potential virus shedding or recommended duration of transmission-based precautions. Before discharge, the resident's diagnosis and current precautions are provided to care providers (e.g., home-healthcare agencies, family) as well as transporting personnel.
9. Work accommodations to avoid potentially high-risk exposure scenarios, such as performing or assisting with aerosol-generating procedures on residents with suspected or confirmed influenza, are considered for staff at high risk for complications.
10. Staff who develop respiratory symptoms are to apply facemasks and leave the facility as soon as possible. Ill staff may not return to work until:
 - a. they have been afebrile longer than 24 hours (without antipyretic treatment) and respiratory symptoms have improved; OR
 - b. no sooner than 5 days after onset of illness.

continues on next page

Visitor Access During Outbreak

1. Restriction of non-essential visitation and movement within the facility may be considered at the discretion of the facility.
2. All visitors are instructed to follow respiratory hygiene and cough etiquette precautions.
3. Visits are scheduled and controlled to allow for screening visitors for symptoms of acute respiratory illness before entering the facility.
4. Visitors are instructed on hand hygiene and use of personal protective equipment (PPE) while in the resident's room.

Treatment

1. Antiviral treatment and chemoprophylaxis (oseltamivir) are provided for residents in accordance with treatment guidelines and current orders. This may include antiviral chemoprophylaxis for asymptomatic exposed residents.
2. Unvaccinated staff are offered influenza vaccination and antiviral chemoprophylaxis for 14 days after vaccination.
3. Antiviral chemoprophylaxis may be offered to staff for the duration of the outbreak in situations where influenza vaccine is unavailable or contraindicated.

Isolation – Categories of Transmission-Based Precautions

Policy Statement

Transmission-based precautions are initiated when a resident develops signs and symptoms of a transmissible infection; arrives for admission with symptoms of an infection; or has a laboratory confirmed infection; and is at risk of transmitting the infection to other residents.

Policy Interpretation and Implementation

1. Standard precautions are used when caring for residents at all times regardless of their suspected or confirmed infection status.
2. Transmission-based precautions are additional measures that protect staff, visitors and other residents from becoming infected. These measures are determined by the specific pathogen and how it is spread from person to person. The three types of transmission-based precautions are contact, droplet and airborne.
3. The Centers for Disease Control and Prevention (CDC) maintains a list of diseases, modes of transmission and recommended precautions.
4. The facility makes every effort to use the least restrictive approach to managing individuals with potentially communicable infections. Transmission-based precautions are used only when the spread of infection cannot be reasonably prevented by less restrictive measures.
5. When a resident is placed on transmission-based precautions, appropriate notification is placed on the room entrance door and on the front of the chart so that personnel and visitors are aware of the need for and the type of precaution.
 - a. The signage informs the staff of the type of CDC precaution(s), instructions for use of PPE, and/or instructions to see a nurse before entering the room.
 - b. Signs and notifications comply with the resident's right to confidentiality or privacy.
6. When transmission-based precautions are in effect, non-critical resident-care equipment items such as a stethoscope, sphygmomanometer, or digital thermometer will be dedicated to a single resident (or cohort of residents) when possible.
 - a. If re-use of items is necessary, then the items will be cleaned and disinfected according to current guidelines before use with another resident.

continues on next page

Contact Precautions

1. Contact precautions may be implemented for residents known or suspected to be infected with microorganisms that can be transmitted by direct contact with the resident or indirect contact with environmental surfaces or resident-care items in the resident's environment.
2. The decision on whether contact precautions are necessary will be evaluated on a case by case basis.
3. The individual on contact precautions will be placed in a private room if possible. If a private room is not available, the infection preventionist will assess various risks associated with other resident placement options (e.g., cohorting, placing with a low risk roommate).
4. Staff and visitors will wear gloves (clean, non-sterile) when entering the room.
 - a. While caring for a resident, staff will change gloves after having contact with infective material (for example, fecal material and wound drainage).
 - b. Gloves will be removed and hand hygiene performed before leaving the room.
 - c. Staff will avoid touching potentially contaminated environmental surfaces or items in the resident's room after gloves are removed.
5. Staff and visitors will wear a disposable gown upon entering the room and remove before leaving the room and avoid touching potentially contaminated surfaces with clothing after gown is removed.
6. When transporting individuals with skin lesions, excretions, secretions, or drainage that is difficult to contain, contact precautions will be taken during resident transport to minimize the risk of transmission.

Droplet Precautions

1. Droplet precautions may be implemented for an individual documented or suspected to be infected with microorganisms transmitted by droplets (large-particle droplets [larger than 5 microns in size] that can be generated by the individual coughing, sneezing, talking, or by the performance of procedures such as suctioning).
2. Residents on droplet precautions will be placed in a private room if possible.
 - a. When a private room is not available, residents may share a room with a resident infected with the same microorganism or with limited risk factors.
 - b. When a private room is not available and cohorting is not achievable, a curtain will be used and a distance of at least 3 feet of space will be maintained between the infected resident his or her roommate.
 - c. Special air handling and ventilation are unnecessary and the door to the room may remain open.
3. Masks will be worn when entering the room.
4. Gloves, gown and goggles should be worn if there is risk of spraying respiratory secretions.
5. Resident Transport
 - a. A mask will be placed on the resident during transport from his or her room. The resident will be encouraged to follow respiratory hygiene/cough etiquette to minimize dispersal of droplets.
 - b. If the resident can tolerate a mask and control respiratory secretions, some activities outside the room may be acceptable.

continues on next page

Airborne Precautions

1. Airborne precautions are indicated when an individual is infected with a pathogen that is very small (5 microns or smaller in size) and can be transmitted long distances through the air.
2. Preventing the spread of airborne pathogens requires a room with special air handling and ventilation called an airborne infection isolation room (AIIR).
3. If an AIIR is not available, a resident suspected of having an airborne infectious disease shall be masked and transported to a facility with an AIIR.
4. Any individuals who enter the room of a resident placed on airborne precautions must wear approved respiratory protection.
5. A resident on airborne precautions will wear a mask when leaving the room or coming into contact with others. Depending on the organism, a special filtration mask may be necessary.
6. If the resident is transported to another unit within the facility or to another facility, the infection preventionist (or designee) will notify the unit or facility of the type of precautions the resident is on and the resident's suspected or confirmed type of infection. The facility is also responsible for notifying transport staff of residents that require special care due to infectious conditions.

Version	2.1 (H5MAPL0437)

Isolation – Initiating Transmission-Based Precautions

Policy Statement

Transmission-based precautions are initiated when a resident develops signs and symptoms of a transmissible infection; arrives for admission with symptoms of an infection; or has a laboratory confirmed infection; and is at risk of transmitting the infection to other residents.

Transmission-based precautions may include contact precautions, droplet precautions, or airborne precautions.

The facility makes every effort to use the least restrictive approach to managing individuals with potentially communicable infections. Transmission-based precautions are used only when the spread of infection cannot be reasonably prevented by less restrictive measures.

Policy Interpretation and Implementation

1. If a resident is suspected of, or identified as, having a communicable infectious disease, the charge nurse or nursing supervisor notifies the infection preventionist and the resident's attending physician for evaluation of appropriate transmission-based precautions.
 - a. If the attending physician or his/her alternate fails to respond appropriately to notification of a suspected or confirmed communicable infectious disease, the staff informs the medical director and administrator.
 - b. In the event the attending physician fails to take appropriate action, the infection preventionist or medical director has the authority to implement appropriate transmission-based precautions.
2. Transmission-based precautions are utilized when a resident meets the criteria for a transmissible infection AND the resident has risk factors that increase the likelihood of transmission. These may include (but are not limited to):
 - a. uncontained excretions/secretions;
 - b. non-compliance with standard precautions; or
 - c. cognitive deficits that restrict or interfere with the resident's ability to maintain precautions.
3. When transmission-based precautions are implemented, the infection preventionist (or designee):
 - a. clearly identifies the type of precautions, the anticipated duration, and the personal protective equipment (PPE) that must be used;
 - b. explains to the resident (or representative) the reason(s) for the precautions;
 - c. provides and/or oversees the education of the resident, representative and/or visitors regarding the precautions and use of PPE;
 - d. determines the appropriate notification on the room entrance door and on the front of the resident's chart so that personnel and visitors are aware of the need for and type of precautions:
 - (1) The signage informs the staff of the type of CDC precaution(s), instructions for use of PPE, and/or instructions to see a nurse before entering the room.
 - (2) Signs and notifications comply with the resident's right to confidentiality or privacy.
 - e. ensures that protective equipment (i.e., gloves, gowns, masks, etc.) is maintained outside the resident's room so that anyone entering the room can apply the appropriate equipment;

continues on next page

- f. ensures that protective equipment and supplies needed to maintain precautions during care are in the resident’s room; and
 - g. ensures that an appropriate linen barrel/hamper and waste container, with appropriate liner, are placed in or near the resident’s room.
4. Transmission-based precautions remain in effect until the attending physician or infection preventionist discontinues them, which occurs after criteria for discontinuation are met.
 - a. In an emergency (for example, an outbreak), the infection preventionist, administrator and/or medical director have the administrative authority, accountability, and responsibility to implement measures to control or prevent infections within the facility;
 - b. Notify the health department of reportable diseases, as appropriate;
 - c. Initiate transmission-based (isolation) precautions;
 - d. Obtain laboratory specimens;
 - e. Restrict or ban admissions; and
 - f. Restrict or temporarily discontinue visitation.
 5. Attending physicians are involved in decisions related to infection control for the residents under their care.

Version	2.1 (H5MAPL0438)

Isolation – Notices of Transmission-Based Precautions

Policy Statement

Notices will be used to alert personnel and visitors of transmission-based precautions, while protecting the privacy of the resident.

Policy Interpretation and Implementation

1. When transmission-based precautions are implemented, the infection preventionist (or designee) determines the appropriate notification to be placed on the room entrance door and on the front of the resident's chart so that personnel and visitors are aware of the need for and type of precautions.
2. Signs and notifications comply with the resident's right to confidentiality or privacy. The following may be used to indicate:
 - a. Airborne Precautions:
 - (1) A notice at the doorway instructing visitors to report to the nurses' station before entering the room.
 - (2) A sign indicating airborne precautions on the door to the resident's room.
 - (3) A precautions sticker on the front of the resident's chart.
 - b. Contact Precautions:
 - (1) A notice at the doorway instructing visitors to report to the nurses' station before entering the room.
 - (2) A sign indicating contact precautions on the door to the resident's room.
 - (3) A precautions sticker on the front of the resident's chart.
 - c. Droplet Precautions:
 - (1) A notice at the doorway instructing visitors to report to the nurses' station before entering the room.
 - (2) A sign indicating droplet precautions on the door to the resident's room.
 - (3) A precautions sticker on the front of the resident's chart.

Version	2.1 (H5MAPL0439)

Isolation, Discontinuing

Policy Statement

Transmission-based precautions are discontinued when it is determined that the resident's condition no longer indicates such precautions.

Policy Interpretation and Implementation

1. Residents remain on appropriate transmission-based precautions until discontinued by the attending physician or the infection preventionist.
2. The criteria for continued transmission-based precautions are evaluated daily, or at intervals established by the interdisciplinary team. Precautions will be discontinued as soon the resident is no longer at significant risk of transmitting the infection, for example:
 - a. risk factors for transmission (i.e., uncontained excretions or secretions, cognitive deficits, non-compliance, etc.) are reduced or eliminated; or
 - b. clinical or laboratory results indicate that the infection is resolved.
3. The resident on transmission-based precautions is evaluated for potential negative psychological effects associated with isolation including boredom, anger and depression. Interventions to reduce or minimize the effects are individualized according to the resident's needs and situation.

Version	2.0 (H5MAPL0441)

Isolation, Removing a Body from

Policy Statement

Isolation precautions must be continued after a resident on isolation precautions expires.

Policy Interpretation and Implementation

1. Because blood and body fluids are still infectious, the nurse supervisor on duty shall be responsible for ensuring that appropriate precautions are implemented when a resident on isolation precautions expires.
2. The nurse supervisor on duty shall inform the mortician that isolation precautions apply, and such information shall include the type of precautions that were being implemented when the resident expired.
3. With the exception of masks, the same barriers required prior to death are required postmortem.
4. The staff shall follow this facility's established procedures for terminal cleaning.

Version	1.2 (H5MAPL0442)

Measles Prevention and Control

Policy Statement

1. Staff members will provide documentation of measles vaccine (MMR) and comply with the measles prevention policy outlined below.
2. Residents with signs or symptoms of measles are identified promptly.

Policy Interpretation and Implementation

1. Staff members are to provide written documentation of presumptive immunity to measles, including:
 - a. documentation of vaccination with 2 doses of measles vaccine:
 - (1) The first dose administered at age 12 months or after; and
 - (2) Second dose at least 28 days after the first; OR
 - b. laboratory evidence of immunity; OR
 - c. laboratory confirmation of disease; OR
 - d. birth before 1957.¹
2. Staff members without presumptive immunity to measles are not permitted to enter the room or provide care to residents with known or suspected measles infection.
3. The infection preventionist is responsible for monitoring facility and community infection rates of measles.
4. If measles infection is reported in the community, visitors are screened for signs and symptoms of measles infection before entering the facility.
5. During a measles outbreak, residents, staff and visitors are evaluated for exposure to measles (see *Evaluating a Person for Exposure to Measles in a Healthcare Setting*).
6. Visitors with known or suspected measles exposure or infection are asked to limit or stop visitation with residents until infection is resolved.
7. The infection preventionist reports known or suspected measles cases within the facility to the public health authorities.

Management of Staff Members Who are Exposed or Infected

1. Staff without presumptive immunity who are exposed to measles:
 - a. receive post-exposure prophylaxis²; AND
 - b. are excluded from work from the 5th day after the first exposure to the 21st day after the last exposure.

continues on next page

¹ During a measles outbreak, evidence of two previous doses of measles vaccine is required, regardless of birth year.

² If a healthcare provider without evidence of immunity is exposed to measles, MMR vaccine should be given within 72 hours, or immunoglobulin should be given within 6 days when available.

2. If a healthcare provider without evidence of immunity is exposed to measles, MMR vaccine should be given within 72 hours, or immunoglobulin should be given within 6 days when available.
3. Staff who received the first dose of MMR prior to exposure:
 - a. may remain at work;
 - b. must obtain the second dose of vaccine at least 28 days after the first; and
 - c. are monitored for signs and symptoms for at least 21 days after the last exposure.
4. Staff with known or suspected measles infection are excluded from work for 4 days after the rash appears (onset of rash is considered day “0”). Immunosuppressed individuals are excluded from work for the duration of the illness.

Management of Residents Who are Exposed or Infected

1. Residents without presumptive immunity who are exposed to measles:
 - a. are placed on airborne precautions for 21 days after last exposure, or until discharge (if earlier); AND
 - b. receive post-exposure prophylaxis, as ordered.
2. Residents with signs or symptoms of measles are placed on airborne precautions. Airborne precautions will remain in place for 4 days after the onset of rash (onset of rash is considered day “0”).
3. Rooms of residents infected with measles are cleaned using standard cleaning and disinfecting procedures.
4. Disposable PPE and resident-care items of residents with measles infection are treated as medical waste, in accordance with local and federal regulations.

Outbreak Considerations

1. The infection preventionist will communicate and collaborate with public health authorities regarding outbreak management, including surveillance, reporting and managing large numbers of residents who require airborne precautions.

MRSA – Management of Recurrent Skin and Soft Tissue Infection

Policy Statement

Strategies for the management of recurrent skin and soft tissue infections (SSTI) with methicillin-resistant *Staphylococcus aureus* are consistent with current practice guidelines.

Policy Interpretation and Implementation

1. When the infection preventionist or infection prevention and control committee (based on national or local regulations) deems MRSA to be of special clinical and/or epidemiologic significance to a resident or the facility, contact precautions will be initiated. The components of contact precautions may be adapted for use, especially if the resident has draining wounds or difficulty controlling body fluids.
2. Educate staff and residents about the need for personal hygiene and appropriate wound care, including:
 - a. keeping draining wounds covered with clean, dry bandages;
 - b. performing hand hygiene after touching infected area or any item that has been in contact with the wound;
 - c. encouraging/assisting resident with regular bathing; and
 - d. not allowing residents to share or reuse items that have come in contact with infected skin.
3. Enforce strict environmental cleaning procedures, including:
 - a. focusing cleaning efforts on high-touch surfaces (e.g., door knobs, counters, bath tubs and showers, toilet seats, etc.); and
 - b. using CDC recommended cleaners appropriate for the surface being cleaned.
4. Decolonization may be considered in the following situations:
 - a. A resident develops a recurrent SSTI despite optimizing wound care and hygiene measures; or
 - b. Ongoing transmission is occurring among residents or other close contacts despite optimizing wound care and hygiene measures.
5. Decolonization requires a physician order. Strategies may include:
 - a. nasal decolonization with mupirocin twice daily for 5–10 days; or
 - b. nasal decolonization with mupirocin twice daily for 5–10 days and topical body decolonization regimens with a skin antiseptic solution (e.g., chlorhexidine) for 5–14 days or dilute bleach baths.
 - (1) For dilute bleach baths, 1 teaspoon per gallon of water (or ¼ cup per ¼ tub or 13 gallons of water) given for 15 minutes twice weekly for 3 months.
6. In cases where interpersonal transmission is suspected:
 - a. reinforce personal and environmental hygiene strategies; and
 - b. evaluate contacts for evidence of *S. aureus* infection.
 - (1) Recommend evaluation and treatment of symptomatic contacts; and
 - (2) Recommend the possible decolonization for asymptomatic contacts.
7. Screening cultures prior to decolonization are not recommended if at least one of the previous infections was due to MRSA.

continues on next page

8. Surveillance cultures following decolonization are not recommended in the absence of active infection.
9. Surveillance and reporting of confirmed MRSA infections through the NHSN is recommended.

Survey Tag Numbers	F880
Other References	Clinical Practice Guidelines by the Infectious Disease Society of America for the Treatment of Methicillin-Resistant <i>Staphylococcus Aureus</i> Infections in Adults and Children (2011) Management of Multidrug-resistant Organisms in Healthcare Settings, 2006
Related Documents	Isolation – Categories of Transmission-Based Precautions Multidrug-Resistant Organisms
Version	1.2 (H5MAPL1423)

Multidrug-Resistant Organisms

Policy Statement

Appropriate precautions are taken when caring for individuals known or suspected to have infection with a multidrug-resistant organism.

Policy Interpretation and Implementation

General Guidelines

1. Multidrug-resistant organisms (MDROs) are bacteria and other microorganisms that have developed resistance to one or more classes of antimicrobial drugs.
2. Infection means that the organism is present and is causing illness. Colonization means that the organism is present in or on the body but is not causing illness.

General Prevention and Control of MDROs

The following strategies are adopted from the Centers for Disease Control and Prevention and provide current recommendations for MDRO prevention and control. These recommendations are incorporated into the facility infection prevention and control processes as indicated.

Administrative

1. Make MDRO prevention/control an organizational priority.
2. Provide administrative support and both fiscal and human resources to prevent and control MDRO transmission.
3. Identify experts who can provide consultation and expertise for analyzing epidemiologic data, recognizing MDRO problems, or devising effective control strategies, as needed.
4. Implement systems to communicate information about reportable MDROs to administrative personnel and state/local health departments.
5. Implement a multi-disciplinary process to monitor and improve staff adherence to recommended practices for standard and contact precautions.
6. Implement systems to designate residents known to be colonized or infected with a targeted MDRO and to notify receiving healthcare facilities or personnel prior to transfer of such residents within or between facilities.
7. Support participation in local, regional and/or national coalitions to combat emerging or growing MDRO problems.
8. Provide updated feedback at least annually to healthcare providers and administrators on facility and resident-care unit MDRO infections. Include information on changes in prevalence and incidence, problem assessment and performance improvement plans.

continues on next page

Education/Training

1. Provide education and training on risks and prevention of MDRO transmission during orientation and periodic educational updates for staff. Include information on organizational experience with MDROs and prevention strategies.

Antimicrobial Use

1. Ensure that a multi-disciplinary process is in place to review local susceptibility patterns (antibiograms), and antimicrobial agents included in the formulary, to foster appropriate antimicrobial use.
2. Implement systems (e.g., CPOE, susceptibility report comment, pharmacy or unit director notification) to prompt clinicians to use the appropriate agent and regimen for the given clinical situation.
3. Provide clinicians with antimicrobial susceptibility reports and analysis of current trends, updated at least annually, to guide antimicrobial prescribing practices.
4. In settings with limited electronic communication system infrastructures to implement physician prompts, etc., at a minimum implement a process to review antibiotic use. Prepare and distribute reports to providers.

Surveillance

1. Use standardized laboratory methods and follow published guidelines for determining antimicrobial susceptibilities of targeted and emerging MDROs.
2. Establish systems to ensure that clinical micro labs (in-house and outsourced) promptly notify infection control or a medical director/designee when a novel resistance pattern for that facility is detected.
3. Develop and implement laboratory protocols for storing isolates of selected MDROs for molecular typing when needed to confirm transmission or delineate epidemiology of MDRO in facility.
4. Establish laboratory-based systems to detect and communicate evidence of MDROs in clinical isolates.
5. Prepare facility-specific antimicrobial susceptibility reports as recommended by CLSI and monitor reports for evidence of changing resistance that may indicate emergence or transmission of MDROs.
6. Develop and monitor special-care unit-specific antimicrobial susceptibility reports (e.g., ventilator-dependent units, ICUs, oncology units).
7. Monitor trends in incidence of target MDROs in the facility over time to determine if MDRO rates are decreasing or if additional interventions are needed.

Infection Precautions

1. Follow standard precautions in all situations.
2. Consider the individual resident's clinical situation and facility resources in deciding whether to implement contact precautions.
3. Masks are not recommended for routine use to prevent transmission of MDROs from residents to HCWs.
4. Use masks according to standard precautions when performing splash-generating procedures, caring for residents with open tracheostomies with potential for projectile secretions, and when there is evidence for transmission from heavily colonized sources (e.g., burn wounds).

continues on next page

Room Placement

1. When single-resident rooms are available, assign priority for these rooms to residents with known or suspected MDRO colonization or infection.
2. Give highest priority to those residents who have conditions that may facilitate transmission, e.g., uncontained secretions or excretions.
3. When single-resident rooms are not available, cohort residents with the same MDRO in the same room or resident-care area.
4. When cohorting residents with the same MDRO is not possible, place MDRO residents in rooms with residents who are at low risk for acquisition of MDROs and associated adverse outcomes from infection and are likely to have short lengths of stay.

Environmental Cleaning

1. Follow recommended cleaning, disinfection and sterilization guidelines for maintaining resident care areas and equipment.
2. Dedicate non-critical medical items to use on individual residents known to be infected or colonized with an MDRO. Prioritize room cleaning of residents on contact precautions. Focus on cleaning and disinfecting frequently touched surfaces (e.g., bed rails, bedside commodes, bathroom fixtures in resident rooms, doorknobs) and equipment in immediate vicinity of resident.

Decolonization

1. Routine decolonization of residents is not recommended.

Intensified interventions to prevent MDRO transmission

Indications and Approach

1. Indications for intensified MDRO control efforts:
 - a. When incidence or prevalence of MDROs are not decreasing despite implementation of and correct adherence to the routine control measures described above; or
 - b. When the first case or outbreak of an epidemiologically important MDRO (e.g., VRE, MRSA, VISA, VRSA, MDR-GNB) is identified within a healthcare facility or unit.
2. Indications for intensified MDRO control efforts should result in selection and implementation of one or more of the interventions/measures described below. Individualize the selection of control measures according to local considerations.
3. Continue to monitor the incidence of target MDRO infection and colonization after additional interventions are implemented. If rates do not decrease, implement more interventions as needed to reduce MDRO transmission.

Administrative Measures

1. Identify persons with experience in infection control and the epidemiology of MDRO, either in house or through outside consultation, for assessment of the local MDRO problem and for the design, implementation, and evaluation of appropriate control measures.

continues on next page

2. Provide necessary leadership, funding, and day-to-day oversight to implement interventions selected. Involve the governing body and leadership of the healthcare facility or system that have organizational responsibility for this and other infection control efforts.
3. Evaluate healthcare system factors for their role in creating or perpetuating transmission of MDROs, including: staffing levels, education and training, availability of consumable and durable resources, communication processes, policies and procedures, and adherence to recommended infection control measures (e.g., hand hygiene and standard or contact precautions). Develop, implement, and monitor action plans to correct system failures.
4. During the process, update healthcare providers and administrators on the progress and effectiveness of the intensified interventions. Include information on changes in prevalence, rates of infection and colonization; results of assessments and corrective actions for system failures; degrees of adherence to recommended practices; and action plans to improve adherence to recommended infection control practices to prevent MDRO transmission.

Educational Interventions

1. Intensify the frequency of MDRO educational programs for healthcare personnel, especially those who work in areas in which MDRO rates are not decreasing. Provide individual or unit-specific feedback when available.

Antimicrobial Use

1. Review the role of antimicrobial use in perpetuating the MDRO problem targeted for intensified intervention. Control and improve antimicrobial use as indicated. Antimicrobial agents that may be targeted include vancomycin, third-generation cephalosporins, and anti-anaerobic agents for VRE; third-generation cephalosporins for ESBLs; and quinolones and carbapenems.

Surveillance

1. Calculate and analyze prevalence and incidence rates of targeted MDRO infection and colonization in populations at risk. When possible, distinguish colonization from infection.
2. Include only one isolate per resident, not multiple isolates from the same resident, when calculating rates.
3. Increase the frequency of compiling and monitoring antimicrobial susceptibility summary reports for a targeted MDRO as indicated by an increase in incidence of infection or colonization with that MDRO.
4. Develop and implement protocols to obtain active surveillance cultures (ASC) for targeted MDROs from residents in populations at risk (e.g., patients in intensive care, burn, bone marrow/stem cell transplant, and oncology units; residents transferred from facilities known to have high MDRO prevalence rates; roommates of colonized or infected persons; and residents known to have been previously infected or colonized with an MDRO).
5. Obtain ASC from areas of skin breakdown and draining wounds. In addition, include the following sites according to target MDROs:
 - a. For MRSA: Sampling the anterior nares is usually sufficient. Throat, endotracheal tube aspirate, percutaneous gastrostomy sites, and perirectal or perineal cultures may be added to increase the yield. Swabs from several sites may be placed in the same selective broth tube prior to transport.
 - b. For VRE: Stool, rectal, or perirectal samples should be collected.
 - c. For MDR-GNB (gram-negative bacilli): Endotracheal tube aspirates or sputum should be cultured if a respiratory tract reservoir is suspected (e.g., *Acinetobacter* spp., *Burkholderia* spp.).

continues on next page

6. Obtain surveillance cultures for the target MDRO from residents at the time of admission to high-risk areas, e.g., ICUs, and at periodic intervals as needed to assess MDRO transmission.
7. Conduct culture surveys to assess the efficacy of the enhanced MDRO control interventions.
8. Conduct serial (e.g., weekly, until transmission has ceased and then decreasing frequency) unit-specific point prevalence culture surveys of the target MDRO to determine if transmission has decreased or ceased.
9. Repeat point prevalence culture surveys at routine intervals or at time of resident discharge or transfer until transmission has ceased.
10. If indicated by assessment of the MDRO problem, collect cultures to assess the colonization status of roommates and other residents with substantial exposure to residents with known MDRO infection or colonization.
11. Obtain cultures of healthcare personnel for target MDRO when there is epidemiologic evidence implicating the healthcare staff member as a source of ongoing transmission.

Enhanced Infection Control Precautions

Use of Contact Precautions

1. Implement contact precautions routinely for all residents colonized or infected with a target MDRO.
2. Because environmental surfaces and medical equipment, especially those in close proximity to the resident, may be contaminated, don gowns and gloves before or upon entry to the resident's room or cubicle.
3. Modify contact precautions to allow MDRO colonized/infected residents whose site of colonization or infection can be appropriately contained and who can observe good hand hygiene practices to enter common areas and participate in group activities.
4. When ASC are obtained as part of an intensified MDRO control program, implement contact precautions until the surveillance culture is reported negative for the target MDRO.
5. No recommendation is made regarding universal use of gloves, gowns, or both in high-risk units in acute-care hospitals.

Resident Admission and Room Placement

1. Place MDRO residents in single-resident rooms.
2. Cohort residents with the same MDRO in designated areas (e.g., rooms, bays, resident care areas).
3. When transmission continues despite adherence to standard and contact precautions and cohorting residents, assign dedicated nursing and ancillary service staff to the care of MDRO residents only. Some facilities may consider this option when intensified measures are first implemented.
4. Stop new admissions to the unit of facility if transmission continues despite the implementation of the enhanced control measures described above. (Refer to state or local regulations that may apply upon closure of units or services.)

continues on next page

Enhanced Environmental Measures

1. Implement resident-dedicated or single-use disposable noncritical equipment (e.g., blood pressure cuff, stethoscope), instruments and devices.
2. Intensify and reinforce training of environmental staff who work in areas targeted for intensified MDRO control and monitor adherence to environmental cleaning policies. Some facilities may choose to assign dedicated staff to targeted resident care areas to enhance consistency of proper environmental cleaning and disinfection services.
3. Monitor (i.e., supervise and inspect) cleaning performance to ensure consistent cleaning and disinfection of surfaces in close proximity to the resident and those likely to be touched by the resident and staff (e.g., bedrails, carts, bedside commodes, doorknobs, faucet handles).
4. Obtain environmental cultures (e.g., surfaces, shared medical equipment) when there is epidemiologic evidence that an environmental source is associated with ongoing transmission of the targeted MDRO.
5. Vacate units for environmental assessment and intensive cleaning when previous efforts to eliminate environmental reservoirs have failed.

Decolonization

1. Consult with physicians with expertise in infectious diseases and/or healthcare epidemiology on a case-by-case basis regarding the appropriate use of decolonization therapy for residents or staff during limited periods of time, as a component of an intensified MRSA control program.
2. When decolonization for MRSA is used, perform susceptibility testing for the decolonizing agent against the target organism in the individual being treated or the MDRO strain that is epidemiologically implicated in transmission. Monitor susceptibility to detect emergence of resistance to the decolonizing agent. Consult with a microbiologist for appropriate testing for mupirocin resistance, since standards have not been established.
 - a. Because mupirocin-resistant strains may emerge and because it is unusual to eradicate MRSA when multiple body sites are colonized, do not use topical mupirocin routinely for MRSA decolonization of residents as a component of MRSA control programs in any healthcare setting.
 - b. Limit decolonization of staff found to be colonized with MRSA to persons who have been epidemiologically linked as a likely source of ongoing transmission to residents. Consider reassignment of staff if decolonization is not successful and ongoing transmission to residents persists.
3. No recommendation can be made for decolonizing residents with VRE or MDR-GNB. Regimens and efficacy of decolonization protocols for VRE and MDR-GNB have not been established.

Novel or Targeted MDROs

1. Strategies to identify targeted MDROs include:
 - a. surveillance of clinical cultures (retrospective and prospective) to identify organisms with patterns of resistance;
 - b. additional follow-up testing of saved isolates with certain resistance phenotypes; and
 - c. periodic point prevalence surveys on high-risk units.
2. When a novel or emerging MDRO is identified (facility- or community-based), colonization screening and containment strategies are implemented.

continues on next page

3. Measures to control transmission are based on response tiers (Tier 1, 2, or 3 organisms) (see <https://www.cdc.gov/hai/containment/guidelines.html>) and include:
 - a. investigation of the resident’s healthcare exposure prior to and after the positive culture;
 - b. contact investigation; and
 - c. infection control measures.
4. The infection preventionist consults the health department for assignment of specific organisms to tiers.
5. For MDROs that are not identified as novel or emerging, the following precautions are implemented, as appropriate. Specific precautions indicated by organism are determined by the infection preventionist.

Table 1: Summary of Response Recommendations for Containment of Novel or Targeted MDROs by Tier

Description	Tier 1 Resistance mechanisms never or very rarely identified in the United States; pan-resistant organisms with the potential for wider spread in a region	Tier 2 Mechanisms and organisms not regularly found in a region	Tier 3 Mechanisms and organisms regularly found in a region but not endemic
Healthcare Investigation			
Review the resident’s healthcare exposures prior to and after the positive culture	Always	Always	Always
Contact Investigation			
Screening of healthcare roommates	Always	Always	Always
Broader screening of healthcare contacts	Always	Sometimes	Sometimes
Prospective lab surveillance	Always	Always	Always
Retrospective lab surveillance	Always	Always	Sometimes
Household contact screening	Sometimes	Rarely	Rarely
Environmental sampling	Sometimes	Rarely	Rarely
Healthcare personnel screening	Sometimes	Rarely	Rarely
Evaluate potential spread to healthcare facilities that regularly share residents with the index healthcare facility	Sometimes	Sometimes	Rarely
Infection Control Measures			
Prompt notification of healthcare providers and resident and implementation of appropriate transmission-based precautions	Always	Always	Always
Clear communication of resident status with transferring facilities	Always	Always	Always
On-site infection control assessment with observations of practice	Always	Always	Sometimes

Norovirus Prevention and Control

Policy Statement

This facility will implement strict infection control measures to prevent the transmission of norovirus infection.

Policy Interpretation and Implementation

1. Avoid exposure to vomitus or diarrhea. Place residents on contact precautions in a single occupancy room, if possible, when symptoms are consistent with norovirus gastroenteritis.
2. When residents with norovirus gastroenteritis cannot be accommodated in single occupancy rooms, efforts will be made to separate them from asymptomatic residents.
3. Approaches for cohorting residents during outbreaks may include placing residents in multi-occupancy rooms, or designating resident care areas or contiguous sections within the facility for resident cohorts.
4. During outbreaks, residents with norovirus gastroenteritis will be placed on contact precautions for a minimum of 48 hours after the resolution of symptoms.
5. Longer periods of isolation or cohorting for medically complex residents may be considered based on clinical judgment.
6. The following may be considered in an effort to prevent or control norovirus transmission during outbreaks:
 - a. Minimizing resident movements within the unit;
 - b. Restricting symptomatic and recovering residents from leaving the resident-care area unless it is for essential care or treatment; and
 - c. Suspending group activities (e.g., dining events) for the duration of an outbreak.
7. During outbreaks, use soap and water for hand hygiene after providing care or having contact with residents suspected or confirmed with norovirus gastroenteritis.
8. Perform routine cleaning and disinfection of frequently touched environmental surfaces and equipment in isolation and cohorted areas, as well as high-traffic clinical areas. Frequently touched surfaces include, but are not limited to, commodes, toilets, faucets, hand/bed railing, telephones, door handles, computer equipment, and kitchen preparation surfaces.
9. Clean and disinfect shared equipment between residents using EPA-registered products with label claims for use in healthcare. Follow the manufacturer's recommendations for application and contact times. The EPA lists products with activity against norovirus on their website.
10. During outbreaks of norovirus gastroenteritis unit level cleaning will be increased to twice daily, with frequently touched surfaces cleaned and disinfected three times daily using EPA-approved products for healthcare settings.
11. Clean and disinfect surfaces starting from the areas with a lower likelihood of norovirus contamination (e.g., tray tables, counter tops) to areas with highly contaminated surfaces (e.g., toilets, bathroom fixtures). Change mop heads when a new bucket of cleaning solution is prepared or after cleaning large spills of emesis or fecal material.

continues on next page

12. All disposable resident-care items will be discarded and unused linens laundered after residents on isolation for norovirus gastroenteritis are discharged or transferred. Minimize waste by limiting the number of disposable items brought into rooms/areas with residents on contact precautions.
13. Use standard precautions for handling soiled resident-service items or linens, including the use of appropriate PPE.
14. During outbreaks, change privacy curtains when they are visibly soiled and upon resident discharge or transfer.
15. Handle soiled linens carefully, without agitating them, to avoid dispersal of virus. Use standard precautions, including the use of appropriate PPE (e.g., gloves and gowns), to minimize the likelihood of cross-contamination.
16. Double bagging, incineration, or modifications for laundering are not indicated for handling or processing soiled linen.
17. Clean surfaces and resident equipment prior to the application of a disinfectant. Follow the manufacturer's recommendations for optimal disinfectant dilution, application, and surface contact time with an EPA-approved product with claims against norovirus.
18. To prevent food-related outbreaks of norovirus gastroenteritis in healthcare settings, food handlers must perform hand hygiene prior to contact with or the preparation of food items and beverages.
19. Personnel who work with, prepare or distribute food will be excluded from duty if they develop symptoms of acute gastroenteritis. Personnel will not return to these activities until a minimum of 48 hours after the resolution of symptoms or longer as required by local health regulations.
20. All shared or communal food items for residents or staff will be removed from clinical areas for the duration of the outbreak.
21. Healthcare personnel who have symptoms consistent with norovirus infection will adhere to sick leave policies.
22. Ill personnel will be excluded from work for a minimum of 48 hours after the resolution of symptoms. Once personnel return to work, the importance of performing frequent hand hygiene will be reinforced, especially before and after each resident contact.
23. In the event of an outbreak of norovirus gastroenteritis, staff will care for one resident cohort on their unit and will not move between resident cohorts (e.g., resident cohorts may include symptomatic, asymptomatic exposed, or asymptomatic unexposed resident groups).
24. Non-essential visitors will be restricted from affected areas of the facility during outbreaks of norovirus gastroenteritis.
25. If it is necessary to have continued visitor privileges during outbreaks, visitors with symptoms consistent with norovirus infection will be screened and excluded. All visitors will comply with hand hygiene and contact precautions.

Quarantine

Policy Statement

The facility will protect the health and well being of our residents and staff during infectious disease outbreaks. Quarantine is generally enacted by governmental authorities.

Policy Interpretation and Implementation

1. Should quarantine be declared, the administrator, with the input of the medical director and director of nursing services, will work with governmental authorities to implement quarantine practices appropriate for the specific threat and as directed by authorities.
2. The requirements of the quarantine directive will determine who may enter or leave the facility.
3. A quarantine directive will initiate the facility's emergency management system.

Reportable Diseases

Policy Statement

Certain infectious, contagious, or communicable diseases are reported to appropriate city, county and/or state health department officials.

Policy Interpretation and Implementation

1. Should any resident(s) or staff be suspected or diagnosed as having a reportable communicable/infectious disease according to state-specific criteria, such information is promptly reported to appropriate local and/or state health department officials.
2. If the disease or condition is listed as a nationally notifiable infectious disease according to the CDC, the infection preventionist, or designee, notifies the state health department.

Tuberculosis Infection Control Program

Policy Statement

The facility recognizes that tuberculosis (TB) transmission has been identified as a risk in healthcare settings. To try to prevent nosocomial transmission of TB, our facility has instituted a tuberculosis infection control program.

Policy Interpretation and Implementation

1. This facility's TB infection control program includes the early identification, isolation, and transfer of persons with active tuberculosis. The program incorporates the following components:
 - a. Assignment of responsibility for the oversight of TB infection control to the infection control committee. _____ is designated to oversee the TB program;
 - b. An annual TB risk assessment (TBRA) and TB risk classification based on the information obtained from the TBRA;
 - c. Administrative, environmental, and respiratory controls established in accordance with the current risk classification;
 - d. Screening and surveillance of residents and employees for latent tuberculosis infection (LTBI) and active TB as appropriate for the current TB risk classification;
 - e. A protocol for the prompt recognition and transfer of persons with suspected or identified active TB;
 - f. Administrative procedures and infection control methods to prevent and reduce the generation of infectious droplet nuclei (e.g., staff training on cough hygiene, airborne infection precautions);
 - g. Disinfection and environmental methods that reduce the number of infectious droplet nuclei in contaminated air;
 - h. Guidelines for cleaning, disinfecting, and sterilizing contaminated items; and
 - i. Investigation of any cases of healthcare-associated tuberculosis in collaboration with local or state health departments.
2. The medical director, director of nursing services, and infection preventionist will review the tuberculosis infection control program annually with the infection control committee. They shall consider the possible need to change or update current workplace procedures based on CDC and/or state recommendations.
3. The infection control committee will present any recommendations to the facility's quality assurance committee.
4. The inservice coordinator will provide annual staff education regarding tuberculosis recognition and prevention.

Related Documents	<p>Tuberculosis, Employee Screening for Airborne Precautions (Sign) Tuberculosis – Employee Exposure Follow-Up Tuberculosis, Screening Residents for</p>
Version	2.1 (H5MAPL0905)

Tuberculosis, Employee Screening for

Policy Statement

All employees are screened for latent tuberculosis infection (LTBI) and active tuberculosis (TB) disease, using tuberculin skin test (TST) or interferon gamma release assay (IGRA) and symptom screening prior to beginning employment.

Policy Interpretation and Implementation

Screening

1. Each newly hired employee is screened for LTBI and active TB disease after an employment offer has been made but prior to the employee's duty assignment.
2. Screening includes a baseline test for LTBI using either a TST or IGRA, individual risk assessment and symptom evaluation.
 - a. If the baseline test is negative and the individual risk assessment indicates no risk factors for acquiring TB, then no additional screening is indicated.
 - b. If the baseline test is positive, but the individual risk assessment is negative and the individual is asymptomatic, a second test (either TST or IGRA) is conducted.
3. The employee health coordinator (or designee) will accept documented verification of TST or IGRA results within the preceding 12 months.
 - a. If the previous TST or IGRA result was negative and the individual is at low risk of TB infection, the employee will not be re-tested prior to beginning employment.
 - b. If the previous TB test was positive, but the individual is at low risk for TB infection, is asymptomatic, and is at low risk of disease progression, a second test will be conducted.
 - c. Individuals who have had BCG vaccination will have an initial screening test. An IGRA is the preferred method of testing for individuals who have received the BCG vaccine.
4. Third party contractors who may come in contact with residents, including service employees, consultants and privately hired sitters, must provide proof of screening for LTBI and active TB disease prior to contact with residents, or as required by state regulations.

Evaluation and Treatment of Positive Screening

1. If first baseline test and individual risk assessment are both positive, or if the follow-up test is positive the individual must undergo symptom evaluation and chest X-ray to rule out active TB disease.
2. If the chest X-ray is negative and he/she is free of symptoms of active TB, the employee is considered free of active tuberculosis but positive for LTBI.
 - a. Employees who are diagnosed with LTBI are strongly encouraged to complete the recommended treatment for LTBI.
 - b. Employees who do not complete LTBI treatment are monitored and screened annually for symptoms. In addition, they are provided with education about the signs and symptoms of active TB and advised to contact the employee health coordinator immediately if symptoms develop.

continues on next page

3. If the X-ray shows signs of lung abnormalities or the symptom questionnaire is positive, the employee is referred to his/her private physician or the appropriate health department to discuss possible TB prophylaxis or treatment.
 - a. The private physician or health department must provide the employee health coordinator with a signed medical release indicating that the individual is free from active TB prior to beginning or returning to work.

Serial Testing of Employees

1. The decision to perform serial (e.g., annual) testing after baseline is based on individual risk factors of exposure both at work and outside of work.
2. The infection preventionist determines how to proceed with follow up testing based on individual risk factors and baseline test results.

Timing of Testing and COVID-19 Vaccines

1. For employees who require baseline testing (upon hire or before entering the facility) at the same time they are scheduled to receive an mRNA COVID-19 vaccine, proceed as follows.
 - a. Conduct TB symptom screening.
 - (1) If testing with the IGRA, draw blood for IGRA prior to first dose of COVID-19 vaccine.
 - (2) If testing with TST, administer TST prior to first dose of COVID-19 vaccine.
 - b. Do not delay the COVID-19 vaccine to test for TB infection.
 - (1) If the vaccine has already been given, defer the TST or IGRA until ≥ 4 weeks after the vaccine series is completed.
2. For employees who require testing for other reasons (i.e., medical care), proceed as follows.
 - a. Conduct TB symptom screening.
 - b. Consult with medical provider and/or health department regarding whether to delay TB testing for individuals who have received the COVID-19 vaccine, based on symptom screening and risk of disease progression.
 - (1) If tested under these circumstances and the results are negative, consider retesting again ≥ 4 weeks after the vaccine series is completed.
 - (2) If the individual has symptoms or findings of active TB disease, refer for a medical evaluation regardless of TST or IGRA results.

Tuberculosis, Screening Residents for

Policy Statement

This facility shall screen all residents for tuberculosis infection and disease (TB). Individuals identified with active TB disease shall be isolated from other residents and ancillary staff, and transported to an appropriate care facility as soon as possible.

Policy Interpretation and Implementation

Screening New Admissions or Readmissions:

1. The admitting nurse will screen referrals for admission and readmission for information regarding exposure to or symptoms of TB.
2. Signs and symptoms of TB, include:
 - a. coughing for > 3 weeks;
 - b. loss of appetite;
 - c. fatigue;
 - d. weight loss;
 - e. night sweats;
 - f. bloody sputum or hemoptysis;
 - g. hoarseness;
 - h. fever; and/or
 - i. chest pain.
3. If a potential resident has been exposed to active TB or is at increased risk of TB infection he or she will be screened for latent tuberculosis infection (LTBI) using tuberculin skin tests (TST) or interferon gamma release assay (IGRA).
4. If the IGRA or TST is positive, the nursing staff will contact the physician to obtain orders for a CXR and the physician will assess the resident prior to admission for possible active TB.
5. Individuals with signs and symptoms of active TB disease shall be isolated from other residents and ancillary staff, and transported to an appropriate care facility as soon as possible.
6. Screening of new admissions or readmissions for tuberculosis infection and disease is in compliance with state regulations.

Handling Residents Suspected to Have Active TB:

1. The nursing staff and/or physician will immediately report to the infection preventionist the name of any resident with suspected active TB.
2. The infection preventionist will initiate a transfer to the hospital to ensure appropriate TB infection control until the case is clinically confirmed or denied.
3. Nursing staff will place a surgical mask over the mouth and nose of any resident having, or suspected of having, active TB, and will arrange for prompt transfer to an acute care hospital.

continues on next page

4. The resident with suspected TB will remain in a room separate from other residents and visitors with the door closed until the resident is transferred.
5. The facility will not collect sputum specimens on such residents.
6. Only employees who have been fit-tested with HEPA N-95 high particulate filter masks will use such devices in the care for residents who are waiting for transfer.
7. Fit testing of HEPA N-95 masks will be completed annually in accordance with the TB exposure control plan.
8. The infection preventionist will follow up and report confirmed cases to appropriate agencies as required by law.

Admitting Residents with Recently Identified Active TB:

1. An individual with known active TB must be treated for at least two weeks prior to admission and be cleared by his or her treating physician before he or she can be admitted or readmitted.
2. Before the facility admits or readmits anyone who has recently been treated as an inpatient or outpatient for active TB, the medical director and/or attending physician will consult with the treating physician and determine whether treatment was adequate and the admission is appropriate.

Serial Testing of Residents:

1. The facility will conduct an annual risk assessment to determine risk of exposure.
2. Risk factors for exposure to TB are:
 - a. those born in or who frequently travel to countries where TB is common;
 - b. people who currently (or previously) live in large group settings where TB is common (homeless shelters, prisons, etc.); or
 - c. those who have spent time with a person who has active TB disease.
3. Residents who have risk factors for exposure to active TB are re-tested for LTBI and symptoms of active TB.
4. Residents who have health conditions or take medications that predispose them to developing active TB disease once infected are tested regularly according to their exposure risk assessment. These conditions include:
 - a. HIV;
 - b. substance abuse;
 - c. silicosis;
 - d. diabetes;
 - e. kidney disease;
 - f. low body weight;
 - g. organ transplants;
 - h. head and neck cancer;
 - i. treatment with corticosteroids or organ transplant; and/or
 - j. certain treatments for rheumatoid arthritis or Crohn's disease.

Bed Bugs, Preventing and Managing Infestations of

Level I

Purpose

Staff will employ infection control strategies to prevent and manage infestation of bed bugs (*Cimex lectularius*).

Preparation

Staff should be trained to recognize bed bugs and bed bug infestation, and know what their specific roles will be should an infestation occur.

General Guidelines

1. Bed bugs belong to the arthropod family Cimicidae.
2. They feed on human blood and other warm-blooded hosts.
3. Adult bed bugs can be as large as 5 mm in length, are red-brown in color and oval shaped.
4. They feed primarily at night. Each feeding “session” lasts for approximately 5 minutes, after which the bugs return to their hiding places – under mattresses, in linens or rugs, or on clothing.
5. There is a distinct odor associated with bed bug infestation. Some describe it as soured fruit or rotting meat.
6. Female bed bugs can lay up to three eggs daily; eggs hatch in 3-5 days.
7. Lifespan of bed bugs can be up to two years with a food source, and up to a year without.
8. Bed bug bites can cause pruritus, papules, vesicle and wheals on the skin. Bites frequently appear in clusters of three. Scratching the bites can lead to local and (later) systemic infections. Severe allergy to the bed bug saliva can lead to anaphylaxis.
9. Infestation can cause psychological stress and “psychogenic itching.”
10. Bed bug management is part of an overall integrated pest management philosophy, which utilizes the most effective combination of methods to control pests while minimizing resident exposure to pesticides.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Flashlight;
2. Gloves;
3. Magnifying glass;
4. Plastic containers for insect specimen;
5. Tweezers or forceps;
6. Photos or drawings of bed bugs and bed bug infestations;
7. Vacuums;
8. Insecticides;
9. Mattress encasements; and
10. Medications, as ordered.

continues on next page

Steps in the Procedure

Identifying and eradicating bed bug infestation is a multi-disciplinary task, involving the resident, nursing, infection control, administration, and housekeeping. The following section identifies areas of responsibility that may be assigned to one or more disciplines.

Monitoring and Inspection

1. Maintain vigilance if there is an outbreak reported in the geographic region.
2. Thoroughly screen newly admitted residents, as well as those who are returning from a stay away from the facility.
 - a. Assess skin for papules, vesicles, wheals, or bullae.
 - b. Ask the resident if they have been exposed to bed bugs or have experienced pruritus.
 - c. Check medication orders for any medication used to treat pruritic rash.
3. Remain alert to complaints of pruritus. (Note that many elderly residents have a reduced sensation of itching.) Pay particular attention to unusual developments in skin appearance in any resident.
4. Regularly inspect mattresses, box springs, bed frames and headboards following current published guidelines for inspection and identification (see References).
 - a. Check resident rooms at night when bed bugs are active. Use a flashlight to check for signs of bed bug activity.
 - b. Use contact and standard precautions during inspections.
5. Consider the use of dogs trained to detect bed bugs, which has been used with success.
6. Signs of bed bug activity include:
 - a. Visual identification of the bugs. Adults and nymphs can be seen with the naked eye. Eggs require a magnifying glass.
 - b. Fecal spots, egg cases, or exuviae (shed skins). These may be visible on mattresses, headboards, bedframes or box springs.
 - c. Odor resembling rotting fruit or meat.

Identification

1. During monitoring and inspection, use a visual guide (see Bed Bug Identification Guide) to help identify insects and residue from insects that are thought to be bed bugs.
2. If evidence of bedbugs is found, collect specimens and contact a pest management company or service that can identify the specimens. Positive identification of bed bugs by a pest control professional should be made before treatment of the infestation begins.

Treatment

1. Effective treatment includes the following components:
 - a. Staff and resident education;
 - b. Recordkeeping and reporting;
 - c. Pre-Treatment (see Pre-Treatment Preparation Checklist);
 - d. Treatment of resident symptoms;
 - e. Treatment of infestation (chemical and non-chemical); and
 - f. Evaluation of treatment effectiveness and continued monitoring.

continues on next page

Treatment of Symptoms

1. The primary goals of treatment are to relieve itching and prevent secondary infections.
2. Administer medications as ordered. These may include antibiotics, antihistamines, corticosteroids, or topical antiseptics.

Treatment of Infestation

1. Remove and/or treat all infested materials using non-chemical methods, including:
 - a. washing and drying bedding, linens, and clothing at high temperatures;
 - b. vacuuming or steam-cleaning floors, mattresses, and any porous surfaces that cannot be machine-washed;
 - c. steaming or heat-treating infested rooms and areas (commercial heating services can be contracted for this procedure);
 - d. freezing, dry ice or liquid CO₂; and
 - e. using mattress encasements that are specifically designed to stop bed bugs.
2. Contract with a licensed pest-control service for chemical methods if non-chemical interventions do not resolve the infestation. However, many bed bugs are resistant to even commercial grade insecticides and insecticides alone will usually not eradicate the problem.
3. Combine chemical and non-chemical efforts for the best results. For severe infestation, relocation may be necessary until the life cycle of nymphs and eggs are complete.

Evaluation and Continued Monitoring

1. After treatment methods have been applied it is important to follow up by monitoring for subsequent infestations. Even if eradication of adult bed bugs was successful, eggs may have survived and hatched.
2. Reapplication of treatments may be needed for several weeks.
3. Keep clutter to a minimum to reduce the potential hiding places for bed bugs.
4. Vacuum regularly.
5. Monitor for bed bugs on a daily basis.
6. Seal cracks and crevices to remove hiding places.

Documentation

The following should be documented at the facility level:

1. Identified instances of infestation (including who reported, how it was confirmed, and the date and time).
2. Response to the report of infestation.
3. Actions taken, including all interventions and strategies to eliminate the infestation.
4. Staff training on eradication measures.
5. Names and license numbers of professional service contractors.
6. The facility-wide plan to monitor and respond to future infestation (Integrated Pest Management Plan).

continues on next page

The following should be documented at the resident level for those directly affected by the infestation:

1. Resident response to the infestation.
2. Interventions and treatments.
3. Notification of family/responsible party.
4. If complications ensue (bites, psychological stress, infections, etc.) accident/incident reports must be completed for each resident affected.

Reporting

Check with local health department regarding mandatory reporting of bed bug infestation.

Reporting Communicable Diseases

Level III

Purpose

The purpose of this procedure is to guide reporting of suspected and confirmed communicable diseases to the appropriate governmental agency or authority.

General Guidelines

1. All reportable infectious diseases (residents' or employees') must be reported to the Infection Preventionist as soon as a definite diagnosis is made or strongly suspected.
2. The Infection Preventionist is responsible for notifying the local, district, or state health department of confirmed cases of state-specific reportable diseases.
3. Diseases that are included in state lists of reportable diseases may also include diseases that must be reported to the CDC (Nationally Notifiable Diseases).
4. Reportable diseases are divided into several groups:
 - a. Mandatory written reporting: a report of the disease must be made in writing.
 - b. Mandatory reporting by telephone: a health care provider must make a report by phone.
 - c. Report of total number of cases.
 - d. Cancer: Cancer cases are reported to the state Cancer Registry.
5. When a disease has been reported to the local, district, or state health department, the Infection Preventionist is responsible for maintaining an in-house report of such action, including the date and time of the report.
6. Should the resident or employee reside in another county, the disease must be reported directly to the county of residence (if known). If such information is not known, the disease will be reported to the local county health department.
7. Cases of sexually transmitted diseases (STDs) must be reported directly to the appropriate local health agency; for example, the STD Branch of the Public Health Department.

Scabies Identification, Treatment and Environmental Cleaning

Level III

Purpose

The purpose of this procedure is to treat residents infected with and sensitized to *Sarcoptes scabiei* and to prevent the spread of scabies to other residents and staff.

Preparation

1. Obtain or verify the existence of a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Scabies is an itching skin irritation caused by the microscopic human itch mite, which burrows into the skin's upper layers and eventually causes itching, tiny irregular red lines just above the skin and an allergic rash.
2. Secondary bacterial skin infections may result from untreated scabies.
3. Incubation period can be 2–6 weeks before onset of itching for persons with no previous exposure. Persons who have been previously infested develop more rapid symptoms, 1–4 days after re-exposure.
4. Symptoms sometimes include severe itching, which worsens at night.
5. Common locations of scabies:
 - a. Anterior axillary region or under breasts;
 - b. Around the waist;
 - c. Between fingers and palm of hand;
 - d. On the inner thigh, groin, buttocks;
 - e. Anterior surfaces of wrists and elbows;
 - f. On body parts which may come in contact with contaminated linens, bedding, or clothing;
 - g. Upper backs of nursing home residents; and
 - h. On hands of employees.
6. Scabies is spread by skin to skin contact with the infected area, or through contact with bedding, clothing, privacy curtains and some furniture.
7. Diagnosis may be established by recovering the mite from its burrow and identifying it microscopically. Failure to identify scrapings as positive does not necessarily exclude the diagnosis. It is difficult to obtain a positive scraping because only one or two mites may cause multiple lesions. Often diagnosis is made from signs and symptoms and treatment followed without scrapings, although scrapings are preferred.
8. Affected residents should remain on Contact Precautions until twenty-four (24) hours after treatment.
9. Family and friends of residents who have had close contact should be notified and given instructions regarding self-examination and treatment.
10. Staff members who may have been exposed should report any rashes developing on their bodies to the Infection Preventionist or Director of Nursing Services.

continues on next page

11. A resident sharing a room with someone infected with scabies should be examined carefully for scabies. If signs and symptoms are present, the resident should be treated in accordance with these procedures. If symptoms are not present, daily assessments should be made until the case has resolved.
12. Individuals who come into contact with the infected resident or with potentially contaminated bedding or clothing should wear a gown and gloves or other protective clothing as established by the facility's infection and exposure control programs.
13. During a scabies outbreak among residents and/or personnel, the Infection Preventionist or Committee will coordinate interdepartmental planning to facilitate a rapid and effective treatment program.
14. Control of an epidemic depends on treating all residents at risk. Specific drug selection for each resident will depend on that individual's risk factors, possible medication interactions, etc.
15. The use of Ivermectin po should be considered during widespread outbreak and/or when treatment with topical medication is unsuccessful.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Magnifying glass;
2. Pen light;
3. Felt tip pen;
4. Alcohol swabs;
5. #15 scalpel blade and handle;
6. Glass slides or curettes (for scraping);
7. Mineral oil;
8. Slides and cover slips;
9. Clear nail polish;
(1) Forceps;
10. Elimite® (or other treatment lotion) or Ivermectin (oral dosage);
11. Disinfectant; and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

Skin Scraping for Microscopic Identification

1. Assess the resident's skin with a magnifying lens and look for lesions suggestive of scabies infestation.
 - a. The shoulders, back, abdomen, hands, wrists, elbows, buttocks, axillae, knees, thighs and breasts are common sites for burrows.
 - b. A bright light and magnifying lens will assist in visualizing the tiny dark speck (the mite) at the end of the burrow.
2. Test for burrows:
 - a. Using a wide felt tip pen (blue or green are best) draw over the burrows and then wipe off with an alcohol swab.
 - b. The alcohol will remove most surface ink, but will not remove the ink taken up by the burrow. Look for a dark irregular line.
3. Apply mineral oil to lesions or scalpel blade, and glass slides.
4. Scrape non-excoriated, non-inflamed areas (burrows and papules) with the scalpel blade or glass slide held at a 90-degree angle to the skin.

continues on next page

5. Scrape while holding the skin taut, until the stratum corneum is removed.
 - a. Vigorous scraping appropriately results in a few red blood cells visible under the microscope, but there should not be frank bleeding.
6. If using a curette.
 - a. Change blades or curettes between scrapings on different persons.
 - b. Blades can be placed on and removed from the handle with a forceps.
7. Place used blades in a sharps container.

Treatment with Permethrin (Elimite®)

1. Bathe the resident, soaping the body completely, rinse well, and then dry thoroughly.
2. Allow his or her body to cool.
3. Apply Elimite® into the skin from the chin to the soles of the feet.
 - a. Scabies rarely infests the scalp of adults, although the hairline, neck, temple, and forehead may be infested in geriatric residents.
 - b. Pay particular attention to skin folds and creases.
 - c. Avoid contact with the eyes.
 - d. Reapply if washed off following use of the toilet, handwashing, etc.
4. Dress the resident with clean clothing. Use freshly laundered bed linens and towels.
5. Leave cream on for at least 8 hours but no more than 12 hours, and then shower or bath the resident in warm water, soaping the body completely, rinsing and drying well.
6. Put on clean clothing. Re-launder towels and bed linens used during treatment.
7. Itching may continue for several days or weeks.
8. A single treatment is generally adequate.

Environmental Control: Typical Scabies

1. Place residents with typical scabies on contact precautions during the treatment period; 24 hours after application of 5% permethrin cream or 24 hours after last application of scabicides requiring more than one application.
2. Wear gloves and a long-sleeved gown for direct hands-on contact.
3. Wash hands after removal of gloves.
4. Place bed linens, towels and clothing used by an affected person during the 4 days prior to initiation of treatment in plastic bags inside the resident's room, handled by gloved and gowned staff without sorting, and washed in hot water for at 10-20 minutes.
5. Use the hot cycle of the dryer for at least 10-20 minutes.
6. Place non-washable blankets and articles in a plastic bag for at least 72 hours. These items can also be dry cleaned or tumbled in a hot dryer for 20 minutes.
7. Change all bed linens, towels and clothes daily.
8. Disinfect multiple residents-use items, such as walking belts, blood pressure cuffs, stethoscopes, wheelchairs, etc., before using on other residents.
9. Discard all creams, lotions or ointments used prior to effective treatment.
10. Vacuum mattresses, upholstered furniture and carpeting. Wrap vacuum cleaner bag in a plastic bag and discard.
 - a. General cleaning and thorough vacuuming of furniture, mattresses or rug is recommended.
 - b. Fumigation is not necessary.
11. For non-fabric items, routine disinfection procedures are adequate.

continues on next page

12. Infected employees can return to work as soon as treatment is completed but should use gowns and gloves for direct resident care to prevent reinfestation until all control measures for affected units/areas have been completed.

Environmental Control: Crusted/Atypical Scabies:

1. Maintain contact precautions until treatment is complete and/or resident is determined (by dermatologist or primary care provider) to be scabies free.
2. Assign resident to a private room, if possible.
3. Restrict visitors until treatment regimen is complete; alternatively, require visitors to gown and glove as required for contact isolation precautions.
 - a. If resources permit, cohort employees to care for this resident only (no other direct care responsibilities) until effective treatment is completed.
4. Employees must wear gloves and a long-sleeved gown with the wrist area covered to attend to resident needs, for housekeeping duties, and handling of laundry. Remove gown and wash hands before leaving the room.
5. Bed linens, towels and clothing used by the affected persons during the 4 days prior to initiation of treatment should be placed in plastic bags inside the resident's room, handled by gloved and gowned laundry staff without sorting, and laundered in hot water for at least 10 minutes.
 - a. The hot cycle of the dryer should be used 50 °C (122 °F) for at least 10-20 minutes.
 - b. Non-washable blankets and articles can be placed in a plastic bag for 7 days, dry cleaned or tumbled in a hot dryer for 20 minutes.
6. Change all bed linens, towels and clothes daily.
7. Blood pressure cuffs, gait belts, stethoscopes, etc. should be designated for single resident use and left in the resident's room. Discard all creams, lotions or ointments used prior to effective treatment.
8. Upholstered furniture containing any cloth fabric should be removed from the room and, if necessary, replaced with plastic or vinyl furniture. Mattresses must be covered with plastic or vinyl.
9. The resident's room should be vacuumed daily with a vacuum cleaner designated for this room alone, followed by routine room cleaning and disinfection.
 - a. The vacuum cleaner bag should be changed daily;
 - b. Seal vacuum cleaner bag in plastic bag and dispose of properly.
10. The room should be terminally cleaned upon discharge or transfer of the resident from the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that care was given.
2. The name and title of the individual(s) who assisted with the care.
3. If the resident refused the treatment, the reason(s) why and the intervention taken.
4. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the care.
2. Report other information in accordance with facility policy and professional standards of practice.

Tuberculosis Risk Assessment

Level III

Purpose

The purpose of the tuberculosis risk assessment (TBRA) is to help evaluate the risk of transmission of tuberculosis (TB) within the facility, and to help establish appropriate administrative, environmental and respiratory protection controls for the recognition and/or prevention of tuberculosis transmission.

Preparation

1. Obtain current surveillance data on TB prevalence in the community (available from local or community health departments).
2. Obtain current surveillance data on TB prevalence in the state (available on the CDC web site or from the state health department).
3. Obtain current surveillance data on TB prevalence in the country (available on the CDC web site).
4. Obtain facility surveillance data on:
 - a. TB prevalence in the last five years (see infection control surveillance records).
 - b. TB prevalence in the last year (see infection control surveillance records).

General Guidelines

1. A TBRA shall be conducted annually to determine appropriate administrative, environmental, and respiratory protection controls needed for the facility based on the current TB risk classification.
2. The TBRA and risk classification shall be used to help identify lapses in infection control that may have led to the transmission of TB infection, as well as to alert the facility of upward trends in TB prevalence in the community.
3. The TBRA and risk classification shall be used to help determine the frequency of employee and resident screening for TB infection.

Equipment and Supplies

1. Case rate of TB disease per 100,000 population for the state.
2. Case rate of TB disease per 100,000 population for the nation.
3. Number of cases of TB disease in the facility for:
 - a. the previous five years; and
 - b. the previous year.
4. A tuberculosis risk assessment tool/worksheet.

Steps in the Procedure

Using the TB Risk Assessment Worksheet:

1. Record the TB case rate for the nation.
2. Record the TB case rate for the state.
3. Record the TB case rate for the community.
4. Record the number of cases of suspected or confirmed TB disease in the facility five years ago, two years ago, and in the past year.
5. Establish the facility risk classification.

continues on next page

6. Review current environmental, administrative, and respiratory protection controls to determine if there are adjustments that must be made based on the risk classification. For example, an increase in the risk classification may warrant the need for an in-depth respiratory protection program to prevent the spread of TB infection to employees.
7. Record the type and frequency of employee screening for TB infection. Based on the TBRA and risk classification, determine if screening frequency is adequate. For example, if the risk classification for the previous year was “low” but has increased to “medium” for the current assessment, annual TB screening of employees and residents is needed.
8. Review the TB Infection Control Program/Plan in the Infection Control Committee and record applicable findings.
9. Review and record the laboratory processing of TB-related specimens, if applicable.
10. Review and record the current environmental controls in the facility.
11. Review and record the current respiratory protection program, if applicable.
12. Record the frequency of TBRA and any problems identified during the last assessment.
13. Record the actions taken to correct any lapses in infection control or to correct problems identified during the previous TBRA.

Reporting

1. Report the findings of the TBRA and the risk classification to the Infection Control Committee and the Administrator.

Version	1.2 (H5MAPR0272)

Tuberculosis Screening – Administration and Interpretation of Tuberculin Skin Test (TST)

Level III

Purpose

To screen for latent tuberculosis infection or active TB disease.

Preparation

1. Obtain an order for the test.
2. Review information about the TB test with the individual and obtain informed consent.
3. Gather supplies:
 - a. Gloves;
 - b. Alcohol wipes;
 - c. Tuberculin syringe with 0.1ml of purified protein derivative; and
 - d. Small bandage.

General Guidelines

1. Only qualified healthcare practitioners administer and interpret TB testing for employees and/or residents.
2. All test results are read in mm.

Steps in the Procedure

1. Perform hand hygiene.
2. Don gloves.
3. Inject 0.1ml (5 tuberculin units) of purified protein derivative (PPD) intradermally on the inner surface of the forearm.
 - a. Inject with a tuberculin needle, bevel side up.
 - b. Slowly inject the solution just below the surface of the skin. When done correctly, it will produce a pale elevation of the skin (a wheal) 6-10 mm in diameter.
4. Remove syringe and dispose in sharps container.
5. Apply small bandage.
6. Remove gloves and perform hand hygiene.
7. Interpret the TST forty-eight (48) to seventy-two (72) hours after administration.
8. Interpretation by a private physician within the 48 to 72 hour time frame is acceptable. Results of the interpretation must be submitted in writing.
9. A positive reaction is an area of induration (palpable, raised, or hardened) around the injection site. Redness (erythema) is not measured.
10. Interpretation of a positive TST is based on risk group:
 - a. **High risk group.** >5 mm induration is classified as positive in:
 - (1) HIV-positive persons;
 - (2) Recent contacts of an active tuberculosis (TB) case;
 - (3) Individuals with fibrotic changes on chest X-ray consistent with previous active TB;
 - (4) Individuals with organ transplants; and
 - (5) Other immunosuppressed individuals.

continues on next page

- b. **Intermediate risk group.** >10 mm induration is classified as positive in:
 - (1) Injectable drug users;
 - (2) Employees and residents of high-risk congregate settings;
 - (3) Mycobacteriology laboratory personnel; and
 - (4) Persons with clinical conditions that place them at high risk.
 - c. **Low risk group.** >15 mm induration is classified as positive in:
 - (1) Persons with no known risk factors for TB.
11. Unless otherwise indicated, administer a booster of 0.1ml (5 tuberculin units) of PPD one to two weeks after the initial TST for individuals with < 10 mm of induration.
12. If the test is interpreted as positive, the individual must be referred for further screening.

Documentation

1. Document the following information in the resident or employee medical record:
 - a. Date and time the TST was given;
 - b. Name and credentials of the person administering the injection;
 - c. Date and time the TST results were interpreted;
 - d. Name and credentials of the individual interpreting the results; and
 - e. If interpretation is positive:
 - (1) Size of induration (measured across the forearm);
 - (2) Risk group and specific risk factor(s); and
 - (3) Follow up instructions.

Coronavirus Disease (COVID-19) – Infection Prevention and Control Measures

Policy Statement

This facility follows recommended standard and transmission-based precautions, environmental cleaning, and social distancing practices to prevent the transmission of COVID-19 within the facility.

Policy Interpretation and Implementation

1. This policy is based on current CDC recommendations for infection prevention and control practices for COVID-19.
2. While in the building, personnel are required to strictly adhere to established infection prevention and control policies, including:
 - a. hand hygiene;
 - b. respiratory hygiene;
 - c. appropriate use of PPE;
 - d. transmission-based precautions, where indicated;
 - e. universal source control (using facemasks or cloth coverings as indicated);
 - f. social distancing when applicable;
 - g. surveillance and reporting of respiratory infections;
 - h. environmental cleaning with EPA-registered disinfectants approved for use against SARS-CoV-2; and
 - i. laundry practices.

Source Control

1. To address asymptomatic and pre-symptomatic transmission, universal source control is required.
 - a. Anyone entering the facility is required to wear a cloth face covering.
 - (1) Cloth face coverings are appropriate for visitors and residents.
 - (a) If someone arrives at the facility without a face covering, a facemask will be provided if supplies are available.
 - (2) Staff are required to wear face coverings upon entering the facility and prior to leaving the building.
 - (a) Cloth face coverings for source control ARE NOT considered PPE. Staff should wear a facemask at all times when in the facility.
 - (b) At the end of shift, staff are required to remove facemask, discard in appropriate receptacle, perform hand hygiene and don a cloth face covering prior to exiting the building.
2. Asymptomatic residents are provided cloth face coverings (or facemasks as supplies permit).
 - a. Residents are asked to wear face coverings or masks when they leave their rooms or are around others.
 - b. Residents are not required to wear cloth face coverings when in their rooms.
 - c. Residents are instructed on proper hand hygiene after touching or removing face covering or mask.
 - d. Residents who are incapacitated, unconscious, have difficulty breathing, or cannot remove face coverings or masks without assistance are not asked to wear them.

continues on next page

3. Resident cloth face coverings are changed if they become soiled, damp, or hard to breathe through. They can be laundered with the resident's belongings and reused.

Screening

1. Points of entry into the facility are temporarily limited. Closed entrances are monitored. Exits and means of egress remain accessible in the event of a fire.
2. Anyone entering the facility (including staff) is screened and triaged for signs and symptoms of and exposure to others with SARS-CoV-2 infection, including:
 - a. fever (measured temperature > 100°F or subjective fever;
 - b. cough;
 - c. shortness of breath or difficulty breathing;
 - d. fatigue;
 - e. muscle or body aches;
 - f. headache;
 - g. new loss of taste or smell;
 - h. sore throat;
 - i. congestion or runny nose;
 - j. nausea or vomiting; and/or
 - k. diarrhea.
3. Anyone with a fever, signs/symptoms of illness, or who has been advised to self-quarantine due to exposure is not allowed to enter the facility.
4. Residents are screened daily for fever and symptoms of COVID-19. Residents with fever or symptoms of COVID-19 are provided a facemask, immediately isolated and placed on appropriate transmission-based precautions.

Physical Distancing

1. Group outings, group activities, and communal dining are cancelled until further notice.
2. Physical distancing of at least six (6) feet is enforced among residents.
3. Staff are required to practice physical distancing with other staff and residents when possible.
4. Televisits are encouraged and supported by facility staff and devices as outline in the Telehealth and Telemedicine policy.
5. Visitor restrictions and screening are outlined in the COVID-19 Visitors policy.

Personal Protective Equipment

1. Staff wear facemasks at all times while in the facility, except while eating or drinking in designated areas.
2. Staff wear eye protection during any resident-care encounters or procedures.
3. For a resident with known or suspected COVID-19:
 - a. Staff wear gloves, isolation gown, eye protection and an N95 or higher-level respirator if available (a facemask is an acceptable alternative if a respirator is not available); and

continues on next page

- b. Resident is placed in a private room with a dedicated bathroom (if available) and closed door; OR
 - c. Resident is cohorted per national, state, or local public health authority recommendations.
4. If there is moderate to substantial COVID-19 transmission in the surrounding community:
 - a. Staff wear all recommended PPE (i.e., gloves, gown, eye protection and respirator or facemask) for the care of all residents on the unit (or facility-wide based on the location of affected residents), regardless of symptoms (based on availability).
 - b. Residents are restricted (to the extent possible) to their rooms except for medically necessary purposes.
 - c. When residents have to leave their room, they wear a facemask, perform hand hygiene, limit their movement in the facility, and practice physical distancing.
 5. When performing aerosol-generating procedures (AGPs), especially those that induce coughing (open suctioning of airways, sputum induction, etc.):
 - a. Staff in the room will wear an N95 or higher-level respirator (if available), eye protection, gloves, and an isolation gown.
 - b. The number of staff present will be limited to only those essential for resident care and procedure support.
 - c. AGPs will ideally take place in an airborne infection isolation room (AIIR). If an AIIR is not available and the procedure is medically necessary, then it will take place in a private room with the door closed.
 - d. The room surfaces will be cleaned and disinfected promptly and with appropriate disinfectant. (See List N on the EPA website for disinfectants that have qualified under EPA's emerging viral pathogens program for use against SARS-COV-2 or other national recommendations.)
 6. Signage on the use of specific PPE (for staff) is posted in appropriate locations in the facility (e.g., outside of a resident's room, wing, or facility-wide).
 7. PPE contingency and crisis capacity strategies have been established due to the current demand and supply shortages of PPE.
 8. If PPE shortage is an issue, facemasks will be limited to residents diagnosed with or having signs/symptoms of respiratory illness or COVID-19.

Cleaning and Disinfection

1. Dedicated or disposable noncritical resident-care equipment (e.g., blood pressure cuffs, blood glucose monitoring equipment) are used, or if not available, then equipment is cleaned and disinfected according to manufacturers' instructions using an EPA-registered disinfectant for healthcare setting prior to use on another resident.
2. Objects and environmental surfaces that are touched frequently and in close proximity to the resident (e.g., bed rails, over-bed table, bedside commode, lavatory surfaces in resident bathrooms) are cleaned and disinfected with an EPA-registered disinfectant for healthcare setting (effective against the organism identified if known) at least daily and when visibly soiled.
3. Infection prevention and control self-assessment is guided by the *COVID-19 Focused Survey for Nursing Homes*.

continues on next page

Version	1.1 (H5MAPL1472)

COVID-19 Focused Survey for Nursing Homes

Infection Control

This survey tool must be used to investigate compliance at F880, **F884 (CMS Federal surveyors only)**, F885, and E0024. Surveyors must determine whether the facility is implementing proper infection prevention and control practices to prevent the development and transmission of COVID-19 and other communicable diseases and infections. Entry and screening procedures as well as resident care guidance has varied over the progression of COVID-19 transmission in facilities. Facilities are expected to be in compliance with CMS requirements and surveyors will use guidance that is in effect at the time of the survey. Refer to QSO memos released at: <https://www.cms.gov/Medicare/Provider-Enrollment-and-Certification/SurveyCertificationGenInfo/Policy-and-Memos-to-States-and-Regions>.

This survey tool provides a focused review of the critical elements associated with the transmission of COVID-19, will help surveyors to prioritize survey activities while onsite, and identify those survey activities which can be accomplished offsite. These efficiencies will decrease the potential for transmission of COVID-19, as well as lessen disruptions to the facility and minimize exposure of the surveyor. Surveyors should be mindful to ensure their activities do not interfere with the active treatment or prevention of transmission of COVID-19.

If citing for noncompliance related to COVID-19, the surveyor(s) must include the following language at the beginning of the Deficient Practice Statement or other place determined appropriate on the Form CMS-2567: “Based on [observations/interviews/record review], the facility failed to [properly prevent and/or contain – or other appropriate statement] **COVID-19.**”

If surveyors see concerns related to compliance with other requirements, they should investigate them in accordance with the existing guidance in Appendix PP of the State Operations Manual and related survey instructions. Surveyors may also need to consider investigating concerns related to Emergency Preparedness in accordance with the guidance in Appendix Z of the State Operations Manual (e.g., for emergency staffing).

For the purpose of this survey tool, “staff” includes employees, consultants, contractors, volunteers, and others who provide care and services to residents on behalf of the facility. The Infection Prevention and Control Program (IPCP) must be facility-wide and include all departments and contracted services.

Critical Element #8 is only for consideration by CMS Federal Survey staff. Information to determine the facility’s compliance at F884 is only reported to each of the 10 CMS locations.

Surveyor(s) reviews for:

- The overall effectiveness of the Infection Prevention and Control Program (IPCP) including IPCP policies and procedures;
- Standard and Transmission-Based Precautions;
- Quality of resident care practices, including those with COVID-19 (laboratory-positive case), if applicable;
- The surveillance plan;

05/08/2020

Page 1

COVID-19 Focused Survey for Nursing Homes

- Visitor entry and facility screening practices;
- Education, monitoring, and screening practices of staff;
- Facility policies and procedures to address staffing issues during emergencies, such as transmission of COVID-19; and
- How the facility informs residents, their representatives, and families of suspected or confirmed COVID-19 cases in the facility.

1. Standard and Transmission-Based Precautions (TBPs)

CMS is aware that there is a scarcity of some supplies in certain areas of the country. State and Federal surveyors should not cite facilities for not having certain supplies (e.g., PPE such as gowns, N95 respirators, surgical masks) if they are having difficulty obtaining these supplies for reasons outside of their control. However, we do expect facilities to take actions to mitigate any resource shortages and show they are taking all appropriate steps to obtain the necessary supplies as soon as possible. For example, if there is a shortage of PPE (e.g., due to supplier(s) shortage which may be a regional or national issue), the facility should contact their health department or healthcare coalition for assistance (<https://www.phe.gov/Preparedness/planning/hpp/Pages/find-hc-coalition.aspx>), follow national and/or local guidelines for optimizing their current supply or identify the next best option to care for residents. Among other practices, optimizing their current supply may mean prioritizing use of gowns based on risk of exposure to infectious organisms, blood or body fluids, splashes or sprays, high contact procedures, or aerosol generating procedures (AGPs), as well as possibly extending use of PPE (follow national and/or local guidelines). Current CDC guidance for healthcare professionals is located at: <https://www.cdc.gov/coronavirus/2019-nCoV/hcp/index.html> and healthcare facilities is located at: <https://www.cdc.gov/coronavirus/2019-ncov/healthcare-facilities/index.html>. Guidance on strategies for optimizing PPE supply is located at: <https://www.cdc.gov/coronavirus/2019-ncov/hcp/ppe-strategy/index.html>. If a surveyor believes a facility should be cited for not having or providing the necessary supplies, the State Agency should contact the CMS Regional Location.

General Standard Precautions:

- Are staff performing the following appropriately:
- Respiratory hygiene/cough etiquette,
 - Environmental cleaning and disinfection, and
 - Reprocessing of reusable resident medical equipment (e.g., cleaning and disinfection of glucometers per device and disinfectant manufacturer's instructions for use)?

Hand Hygiene:

- Are staff performing hand hygiene when indicated?
- If alcohol-based hand rub (ABHR) is available, is it readily accessible and preferentially used by staff for hand hygiene?

COVID-19 Focused Survey for Nursing Homes

- If there are shortages of ABHR, are staff performing hand hygiene using soap and water instead?
- Are staff washing hands with soap and water when their hands are visibly soiled (e.g., blood, body fluids)?
- Do staff perform hand hygiene (even if gloves are used) in the following situations:
 - Before and after contact with the resident;
 - After contact with blood, body fluids, or visibly contaminated surfaces;
 - After contact with objects and surfaces in the resident's environment;
 - After removing personal protective equipment (e.g., gloves, gown, facemask); and
 - Before performing a procedure such as an aseptic task (e.g., insertion of an invasive device such as a urinary catheter, manipulation of a central venous catheter, and/or dressing care)?
- When being assisted by staff, is resident hand hygiene performed after toileting and before meals?
- Interview appropriate staff to determine if hand hygiene supplies (e.g., ABHR, soap, paper towels) are readily available and who they contact for replacement supplies.

Personal Protective Equipment (PPE):

- Determine if staff appropriately use PPE including, but not limited to, the following:
 - Gloves are worn if potential contact with blood or body fluid, mucous membranes, or non-intact skin;
 - Gloves are removed after contact with blood or body fluids, mucous membranes, or non-intact skin;
 - Gloves are changed and hand hygiene is performed before moving from a contaminated body site to a clean body site during resident care; and
 - An isolation gown is worn for direct resident contact if the resident has uncontained secretions or excretions.
- Is PPE appropriately removed and discarded after resident care, prior to leaving room (except in the case of extended use of PPE per national/local recommendations), followed by hand hygiene?
- If PPE use is extended/reused, is it done according to national and/or local guidelines? If it is reused, is it cleaned/decontaminated/maintained after and/or between uses?
- Interview appropriate staff to determine if PPE is available, accessible and used by staff.
 - Are there sufficient PPE supplies available to follow infection prevention and control guidelines? In the event of PPE shortages, what procedures is the facility taking to address this issue?
 - Do staff know how to obtain PPE supplies before providing care?
 - Do they know who to contact for replacement supplies?

COVID-19 Focused Survey for Nursing Homes

Transmission-Based Precautions (Note: PPE use is based on availability and latest CDC guidance. See note on Pages 1-2):

- Determine if appropriate Transmission-Based Precautions are implemented:
- For a resident on Contact Precautions: staff don gloves and isolation gown before contact with the resident and/or his/her environment;
 - For a resident on Droplet Precautions: staff don a facemask within six feet of a resident;
 - For a resident on Airborne Precautions: staff don an N95 or higher level respirator prior to room entry of a resident;
 - For a resident with an undiagnosed respiratory infection: staff follow Standard, Contact, and Droplet Precautions (i.e., facemask, gloves, isolation gown) with eye protection when caring for a resident unless the suspected diagnosis requires Airborne Precautions (e.g., tuberculosis);
 - For a resident with known or suspected COVID-19: staff wear gloves, isolation gown, eye protection and an N95 or higher-level respirator if available. A facemask is an acceptable alternative if a respirator is not available. Additionally, if there are COVID-19 cases in the facility or sustained community transmission, staff implement universal use of facemasks while in the facility (based on availability). When COVID-19 is identified in the facility, staff wear all recommended PPE (i.e., gloves, gown, eye protection and respirator or facemask) for the care of all residents on the unit (or facility-wide based on the location of affected residents), regardless of symptoms (based on availability).
 - Some procedures performed on residents with known or suspected COVID-19 could generate infectious aerosols (i.e., aerosol-generating procedures (AGPs)). In particular, procedures that are likely to induce coughing (e.g., sputum induction, open suctioning of airways) should be performed cautiously. If performed, the following should occur:
 - Staff in the room should wear an N95 or higher-level respirator, eye protection, gloves, and an isolation gown.
 - The number of staff present during the procedure should be limited to only those essential for resident care and procedure support.
 - AGPs should ideally take place in an airborne infection isolation room (AIIR). If an AIIR is not available and the procedure is medically necessary, then it should take place in a private room with the door closed.
 - Clean and disinfect the room surfaces promptly and with appropriate disinfectant. Use disinfectants on List N of the EPA website for EPA-registered disinfectants that have qualified under EPA's emerging viral pathogens program for use against SARS-COV-2 or other national recommendations;
 - Dedicated or disposable noncritical resident-care equipment (e.g., blood pressure cuffs, blood glucose monitor equipment) is used, or if not available, then equipment is cleaned and disinfected according to manufacturers' instructions using an EPA-registered disinfectant for healthcare setting prior to use on another resident;
 - Objects and environmental surfaces that are touched frequently and in close proximity to the resident (e.g., bed rails, over-bed table, bedside commode, lavatory surfaces in resident bathrooms) are cleaned and disinfected with an EPA-registered disinfectant for healthcare setting (effective against the organism identified if known) at least daily and when visibly soiled; and
 - Is signage on the use of specific PPE (for staff) posted in appropriate locations in the facility (e.g., outside of a resident's room, wing, or facility-wide)?

COVID-19 Focused Survey for Nursing Homes

- Interview appropriate staff to determine if they are aware of processes/protocols for Transmission-Based Precautions and how staff is monitored for compliance.
- If concerns are identified, expand the sample to include more residents on Transmission-Based Precautions.

1. Did staff implement appropriate Standard (e.g., hand hygiene, appropriate use of PPE, environmental cleaning and disinfection, and reprocessing of reusable resident medical equipment) and Transmission-Based Precautions (if applicable)? Yes No F880

2. Resident Care

- If there is sustained community transmission or case(s) of COVID-19 in the facility, is the facility restricting residents (to the extent possible) to their rooms except for medically necessary purposes? If there is a case in the facility, and residents have to leave their room, are they wearing a facemask, performing hand hygiene, limiting their movement in the facility, and performing social distancing (efforts are made to keep them at least 6 feet away from others). If PPE shortage is an issue, facemasks should be limited to residents diagnosed with or having signs/symptoms of respiratory illness or COVID-19.
- Has the facility cancelled group outings, group activities, and communal dining?
- Has the facility isolated residents with known or suspected COVID-19 in a private room (if available), or taken other actions based on national (e.g., CDC), state, or local public health authority recommendations?
- For the resident who develops severe symptoms of illness and requires transfer to a hospital for a higher level of care, did the facility alert emergency medical services and the receiving facility of the resident's diagnosis (suspected or confirmed COVID-19) and precautions to be taken by transferring and receiving staff as well as place a facemask on the resident during transfer (as supply allows)?
- For residents who need to leave the facility for care (e.g. dialysis, etc.), did the facility notify the transportation and receiving health care team of the resident's suspected or confirmed COVID-19 status?
- Does the facility have residents who must leave the facility regularly for medically necessary purposes (e.g., residents receiving hemodialysis and chemotherapy) wear a facemask (if available) whenever they leave their room, including for procedures outside of the facility?

2. Did staff provide appropriate resident care? Yes No F880

3. IPCP Standards, Policies and Procedures

- Did the facility establish a facility-wide IPCP including standards, policies, and procedures that are current and based on national standards for undiagnosed respiratory illness and COVID-19?

05/08/2020

Page 5

COVID-19 Focused Survey for Nursing Homes

- Does the facility's policies or procedures include when to notify local/state public health officials if there are clusters of respiratory illness or cases of COVID-19 that are identified or suspected?
- Concerns must be corroborated as applicable including the review of pertinent policies/procedures as necessary.

3. Does the facility have a facility-wide IPCP including standards, policies, and procedures that are current and based on national standards for undiagnosed respiratory illness and COVID-19? Yes No **F880**

4. Infection Surveillance

- How many residents and staff in the facility have fever, respiratory signs/symptoms, or other signs/symptoms related to COVID-19?
- How many residents and staff have been diagnosed with COVID-19 and when was the first case confirmed?
- How many residents and staff have been tested for COVID-19? What is the protocol for determining when residents and staff should be tested?
- Has the facility established/implemented a surveillance plan, based on a facility assessment, for identifying (i.e., screening), tracking, monitoring and/or reporting of fever (at a minimum, temperature is taken per shift), respiratory illness, and/or other signs/symptoms of COVID-19 and immediately isolate anyone who is symptomatic?
- Does the plan include early detection, management of a potentially infectious, symptomatic resident that may require laboratory testing and/or Transmission-Based Precautions/PPE (the plan may include tracking this information in an infectious disease log)?
- Does the facility have a process for communicating the diagnosis, treatment, and laboratory test results when transferring a resident to an acute care hospital or other healthcare provider; and obtaining pertinent notes such as discharge summary, lab results, current diagnoses, and infection or multidrug-resistant organism colonization status when residents are transferred back from acute care hospitals?
- Can appropriate staff (e.g., nursing and unit managers) identify/describe the communication protocol with local/state public health officials?
- Interview appropriate staff to determine if infection control concerns are identified, reported, and acted upon.

4. Did the facility provide appropriate infection surveillance? Yes No **F880**

5. Visitor Entry

- Review for compliance of:
- Screening processes and criteria (i.e., screening questions and assessment of illness);
 - Restriction criteria; and

COVID-19 Focused Survey for Nursing Homes

- Signage posted at facility entrances for screening and restrictions as well as a communication plan to alert visitors of new procedures/restrictions.
- For those permitted entry, are they instructed to frequently perform hand hygiene; limit their interactions with others in the facility and surfaces touched; restrict their visit to the resident's room or other location designated by the facility; and offered PPE (e.g., facemask) as supply allows? What is the facility's process for communicating this information?
- For those permitted entry, are they advised to monitor for signs and symptoms of COVID-19 and appropriate actions to take if signs and/or symptoms occur?

5. Did the facility perform appropriate screening, restriction, and education of visitors? Yes No F880

6. Education, Monitoring, and Screening of Staff

- Is there evidence the facility has provided education to staff on COVID-19 (e.g., symptoms, how it is transmitted, screening criteria, work exclusions)?
- How does the facility convey updates on COVID-19 to all staff?
- Is the facility screening all staff at the beginning of their shift for fever and signs/symptoms of illness? Is the facility actively taking their temperature and documenting absence of illness (or signs/symptoms of COVID-19 as more information becomes available)?
- If staff develop symptoms at work (as stated above), does the facility:
- Place them in a facemask and have them return home;
 - Inform the facility's infection preventionist and include information on individuals, equipment, and locations the person came in contact with; and
 - Follow current guidance about returning to work (e.g., local health department, CDC: <https://www.cdc.gov/coronavirus/2019-ncov/healthcare-facilities/hcp-return-work.html>).

6. Did the facility provide appropriate education, monitoring, and screening of staff? Yes No F880

7. Reporting to Residents, Representatives, and Families

Identify the mechanism(s) the facility is using to inform residents, their representatives, and families (e.g., newsletter, email, website, recorded voice message)

- Did the facility inform all residents, their representatives, and families by 5 PM the next calendar day following the occurrence of a single confirmed COVID-19 infection or of three or more residents or staff with new onset of respiratory symptoms that occurred within 72 hours of each other?

05/08/2020

Page 7

COVID-19 Focused Survey for Nursing Homes

- Did the information include mitigating actions taken by the facility to prevent or reduce the risk of transmission, including if normal operations in the nursing home will be altered (e.g., restrictions to visitation or group activities)?
- Did the information include personally identifiable information?
- Is the facility providing cumulative updates to residents, their representatives, and families at least weekly or by 5 PM the next calendar day following the subsequent occurrence of either: each time a confirmed COVID-19 infection is identified, or whenever three or more residents or staff with new onset of respiratory symptoms occur within 72 hours of each other?
- Interview a resident and a resident representative or family member to determine whether they are receiving timely notifications.

7. Did the facility inform residents, their representatives, and families of suspected or confirmed COVID-19 cases in the facility along with mitigating actions in a timely manner? Yes No F885

8. Reporting to the Centers for Disease Control and Prevention (CDC) – Performed Offsite by CMS. For consideration by CMS Federal Surveyors only.

- Review CDC data files provided to CMS to determine if the facility is reporting at least once a week.
- Review data files to determine if all data elements required in the National Healthcare Safety Network (NHSN) COVID-19 Module are completed.

8. Did the facility report at least once a week to CDC on all of the data elements required in the NHSN COVID-19 Module?
 Yes No F884

9. Emergency Preparedness – Staffing in Emergencies

- Policy development: Does the facility have a policy and procedure for ensuring staffing to meet the needs of the residents when needed during an emergency, such as COVID-19 outbreak?
- Policy implementation: In an emergency, did the facility implement its planned strategy for ensuring staffing to meet the needs of the residents? (N/A if an emergency staff was not needed).

9. Did the facility develop and implement policies and procedures for staffing strategies during an emergency?
 Yes No E0024 N/A

COVID-19 Focused Survey for Nursing Homes

Section 3087 of the 21st Century Cures Act, signed into law in December 2016, added subsection (f) to section 319 of the Public Health Service Act. This new subsection gives the HHS Secretary the authority to waive Paperwork Reduction Act (PRA) (44 USC 3501 et seq.) requirements with respect to voluntary collection of information during a public health emergency (PHE), as declared by the Secretary, or when a disease or disorder is significantly likely to become a public health emergency (SLPHE). Under this new authority, the HHS Secretary may waive PRA requirements for the voluntary collection of information if the Secretary determines that: (1) a PHE exists according to section 319(a) of the PHS Act or determines that a disease or disorder, including a novel and emerging public health threat, is a SLPHE under section 319(f) of the PHS Act; and (2) the PHE/SLPHE, including the specific preparation for and response to it, necessitates a waiver of the PRA requirements. The Office of the Assistant Secretary for Planning and Evaluation (ASPE) has been designated as the office that will coordinate the process for the Secretary to approve or reject each request.

The information collection requirements contained in this information collection request have been submitted and approved under a PRA Waiver granted by the Secretary of Health and Human Services. The waiver can be viewed at <https://aspe.hhs.gov/public-health-emergency-declaration-pra-waivers>.

Coronavirus Disease (COVID-19) – Managing Supplies and Resources

Policy Statement

Essential infection prevention and control supplies are systematically monitored and anticipated.

Policy Interpretation and Implementation

1. The infection preventionist appoints an infection prevention and control supply coordinator who is responsible for monitoring the current supply and anticipated needs for:
 - a. handwashing supplies (soap and paper towels);
 - b. alcohol-based hand rub (ABHR) (containing 60%-95% alcohol);
 - c. tissues;
 - d. personal protective equipment (gloves, gowns, eyewear, facemasks);
 - e. cleaning supplies (including EPA hospital-registered disinfectants effective against human coronaviruses);
 - f. trash bins;
 - g. _____ ;
 - h. _____ ;
 - i. _____ ; and
 - j. _____ .
2. Supplies are stationed throughout the facility to facilitate access and ease of use, for example:
 - a. ABHR in all resident rooms, resident care and common areas;
 - b. soap and paper towels at all handwashing sinks;
 - c. tissues and trash cans in all resident rooms and common areas; and
 - d. PPE in all resident care areas and nursing stations.
3. The infection prevention and control supply coordinator is: _____ .
4. The supply coordinator communicates the infection prevention and control supply needs to the purchasing or business office.
5. The supply coordinator is responsible for maintaining relationships with the local, regional and tribal planning groups, vendors, and/or healthcare coalitions, including:
 - a. communicating estimated needs and current supplies;
 - b. participating in stockpiling and resource sharing arrangements;
 - c. developing strategies for prioritizing limited allocation of resources; and
 - d. identifying normal and alternative channels for procuring resources.
6. Supply needs are estimated using formulas that calculate current and projected demands (for a minimum of eight weeks), including those for surge capacity.
7. Contingency and crisis capacity strategies for personal protective equipment have been established and can be reviewed in the personal protective equipment procedures.

Version	1.1 (H5MAPL1473)

Instructions:
This spreadsheet is designed to help you track how quickly PPE is being used at your facility.
 To start, enter dates into Box A below Day 1, Day 2, Day 3, etc. You can enter the date for Day 1 and drag that cell to the right to autopopulate future days.
 At the start of each day, determine how many full boxes of PPE are remaining from the day before. Do this for each type of PPE.
 *Type of PPE refers to the PPE components you have in stock. Use the next column to fill in the size or brand if applicable. Note: Additional types or brands of PPE can be added in the "Other" Type of PPE section as well.
 Make sure that each box of PPE has the same number of individual units. If they do not, create a new type of PPE category in the cells that say "Other".
 Enter the number of full boxes of each Type of PPE, starting at Day 1 into the yellow cells of Box A. Note: You do not need data for all 14 days, but at least 2 consecutive days of data is needed to calculate a consumption rate.
 The total number of boxes of PPE used per day will be calculated in Box B. Note: This only works if you have entered values for at least day 1 and day 2 in Box A.
 The average rate of PPE consumption (burn rate) will be calculated in the pink section.
 The number of days worth of remaining supplies will be calculated in Box C based on the average consumption rate.
 Note: If you receive a resupply of PPE do not add it into the calculator, as it will disrupt the calculations. Continue following the original supply of PPE entered in Day 1. It is suggested you start a new calculator with the resupplied PPE.
 To skip a day, enter the data from the previous day. For example: If you know the number of boxes remaining at the start of Day 1 and the start of Day 2, but not the start of Day 2, you can insert the value from Day 1 into cell for Day 2 and the tool will still work.
 Important: Add your data to Box A only, do not enter data into any other cells.
 How the calculator works: In Box A, your PPE supply from the day prior is subtracted from the current day (Day 2 - Day 1) and entered in Box B. As additional data is added in Box A the average consumption rate between each two day period is calculated. The total number of consumption of PPE in Box B is used to calculate the average consumption in the pink section.
 Then the number of boxes of PPE entered in Box A is divided by the consumption rate to calculate the number of days supply remaining in Box C.

Box A		How Many Full Boxes Are Remaining at Start of the Day? Enter below, by date.

Coronavirus Disease (COVID-19) – Identification and Management of Ill Residents

Policy Statement

Residents with signs and/or symptoms of COVID-19 will be identified and isolated to help control the spread of infection to other residents, staff and visitors.

Policy Interpretation and Implementation

1. Strategies used for the rapid identification and management of COVID-19 infected residents include:
 - a. screening and monitoring for symptoms;
 - b. surveillance and reporting of respiratory illness;
 - c. testing;
 - d. clinical care;
 - e. resident placement and cohorting;
 - f. transfers; and
 - g. admissions.

Screening and Monitoring

1. The infection preventionist is responsible for establishing and overseeing the active screening and monitoring efforts.
2. Residents are monitored daily for signs of respiratory infection and/or symptoms of COVID-19, including:
 - a. fever or chills;
 - b. cough;
 - c. shortness of breath or difficulty breathing;
 - d. fatigue;
 - e. muscle or body aches;
 - f. headache;
 - g. new loss of taste or smell;
 - h. sore throat;
 - i. congestion or runny nose;
 - j. nausea or vomiting; and/or
 - k. diarrhea.
3. Less common symptoms of COVID-19 such as new or worsening malaise, headache, dizziness, or more than two temperatures $>99.0^{\circ}\text{F}$ will prompt isolation and further evaluation for COVID-19.
4. If a resident has signs or symptoms that suggest a developing respiratory infection or COVID-19:
 - a. the charge nurse is notified immediately;
 - b. the resident is assessed by a licensed nurse;
 - c. assessment information is reported to the Infection Preventionist;

continues on next page

- d. the infection preventionist notifies the local health department of any new suspected cases of COVID-19 and requests testing; and
- e. resident information is added to the *Respiratory Surveillance Line List* and included in the resident impact data for reporting to the CDC.

Surveillance and Reporting

1. All surveillance findings are collected and reviewed daily by the infection preventionist.
2. The health department is notified of any resident with suspected or confirmed COVID-19, severe respiratory infection, or a cluster (3 or more residents or staff with new onset respiratory symptoms within 72 hours).
3. The infection preventionist summarizes outbreaks of respiratory illness in the *LTC Respiratory Surveillance Outbreak Summary* and submits this to the local health department.
4. Suspected and confirmed cases of COVID-19 and COVID-19 deaths are reported to the CDC through the National Health Safety Network (NHSN).

Testing

See *Coronavirus Disease (COVID-19) – Testing Residents*.

Clinical Care

1. Residents with suspected or confirmed COVID-19 are medically managed by their attending physician or designee, with supportive care provided by designated nursing staff, until the resident is transferred or recovers.
2. Staff caring for residents with suspected or confirmed COVID-19 must strictly adhere to infection prevention and control practices outlined in *Coronavirus Disease (COVID-19) – Infection Prevention and Control Measures*.
3. Discontinuation of Transmission-Based precautions for residents with confirmed SARS-CoV-2 infection is based on a symptom-based strategy as described in [Discontinuation of Transmission-Based Precautions and Disposition of Patients with COVID-19 in Healthcare Settings \(Interim Guidance\) Discharging COVID-19 Patients](#).

Resident Placement and Cohorting

1. Residents with suspected COVID-19 are placed in a private room, moved to a dedicated unit, or cohorted with another resident who is suspected to have COVID-19 pending the results of SARS-CoV-2 testing.
2. Residents with confirmed COVID-19 are separated from residents who do not have confirmed COVID-19, or have an unknown status. Dedicated units must be able to adhere to strict infection control practices.
3. Consistent staff assignments are exercised for all residents regardless of symptoms or COVID-19 status. Staff members are not assigned to work across floors or units when possible.
4. Residents with known or suspected COVID-19 are cared for using all recommended PPE, including an N95 or higher level respirator (or facemask if respirators are not available), eye protection, gloves and gown.

continues on next page

5. Residents who may have been exposed to someone with COVID-19 are monitored closely and not placed with unexposed residents until 14 days after exposure or until status of COVID-19 is determined.
6. Infection prevention and control practices and specific strategies for residents with suspected or confirmed COVID-19 on Memory Care Units are informed by *Considerations for Memory Care Units in Long-term Care Facilities*. These practices and strategies are determined by the infection preventionist and the director of nursing services, in conjunction with the medical director.

Transfers

1. Residents with suspected or confirmed COVID-19 who have fever and/or respiratory symptoms are not automatically transferred to the hospital if their clinical condition and symptoms can be managed at the facility.
2. For the resident who develops severe symptoms of illness and requires transfer for a higher level of care:
 - a. emergency medical services and the receiving facility are alerted of the resident's diagnosis (suspected or confirmed COVID-19) and notified of precautions to be taken (transferring and receiving staff); and
 - b. a facemask is placed on the resident during transfer (as supply allows).
3. The infection preventionist, in conjunction with the local health department, has identified facilities dedicated to residents with suspected or confirmed COVID-19, and those designated as non-COVID facilities, and has established arrangements to transfer residents if necessary.
4. Resident transfer to another certified LTC facility for the purpose of cohorting residents with COVID-19 will be conducted under the *Blanket Transfer Waiver* (QSO-20-25). Transfers or discharges to a non-certified location for the purposes of cohorting will only occur after obtaining permission from the state agency.
5. For residents who need to leave the facility for medically necessary purposes (e.g. dialysis, etc.), the transportation and receiving health care team is notified of the resident's suspected or confirmed COVID-19 status. Regardless of COVID-19 status, a facemask is placed on the resident prior to leaving his or her room.

Procedures for Accepting Admissions from Hospitals

1. The decision to admit new residents to the facility is based on the ability to provide care and to keep current residents safe. Factors that are considered when presented with a potential hospital admission include physical space to provide appropriate distancing, staffing levels, and availability of personal protective equipment.
2. For patients/residents who are tested prior to hospital discharge and are COVID-19 negative (including those who were COVID-19 positive and recovered), ADMIT and:
 - a. cohort (in rooms or wings) with other residents of similar status (e.g., new hospital admissions with negative COVID-19 test, etc.), if possible;
 - b. monitor temperature and respiratory symptoms every shift;
 - c. limit contact with other residents (as much as possible); and
 - d. consistently assign staff and limit number of times staff enter resident room.
3. DO NOT ADMIT patients who have not been tested in the hospital prior to discharge (status unknown) or patients who are presumptive or confirmed COVID-19 positive UNLESS:
 - a. there is a dedicated unit or floor in the facility for COVID-19 residents;

continues on next page

- b. staff movement between units is limited as much as possible; and
 - c. there are adequate staffing levels and PPE to manage COVID-19 positive residents.
4. For any resident admitted from the hospital with unknown status:
- a. place in a single room or observation area;
 - b. restrict access to other residents to the extent possible;
 - c. monitor temperature and respiratory symptoms every shift;
 - d. place on contact and droplet precautions and wear recommended PPE when caring for the resident; and
 - e. consistently assign staff and limit number of times staff enter resident room.

COVID-19 Long-Term Care Facility Guidance

April 2, 2020

The Centers for Medicare & Medicaid Services (CMS) and the Centers for Disease Control and Prevention (CDC) are issuing new recommendations to State and local governments and long-term care facilities (also known as nursing homes) to help mitigate the spread of the 2019 Novel Coronavirus (COVID-19). Long-term care facilities are a critical component of America’s healthcare system. They are unique, as they serve as both healthcare providers and as full-time homes for some of the most vulnerable Americans.

In recent weeks, CMS and CDC, at President Trump’s direction, have worked together to swiftly issue unprecedented targeted direction to the long-term care facility industry, including a general prohibition of visitors implemented on March 13, 2020, as well as strict infection control and other screening [recommendations](#). However, recent observations made by CDC and CMS experts onsite in facilities have emphasized that even more must be done to universally implement this key guidance.

To provide critical, needed leadership for the Nation’s long-term care facilities to prevent further spread of COVID-19, CMS and CDC are now recommending the following immediate actions to keep patients and residents safe:

- 1. Nursing Homes should immediately ensure that they are complying with all CMS and CDC guidance related to infection control.**
 - In particular, facilities should focus on adherence to appropriate hand hygiene as set forth by [CDC](#).
 - CMS has also recently issued extensive [infection control guidance](#), including a self-assessment checklist that long-term care facilities can use to determine their compliance with these crucial infection control actions.
 - Facilities should also refer to CDC’s [guidance](#) to long-term care facilities on COVID-19 and also use [guidance](#) on conservation of personal protective equipment (PPE) when unable to follow the long-term care facility guidance.

- 2. As long-term care facilities are a critical part of the healthcare system, and because of the ease of spread in long-term care facilities and the severity of illness that occurs in residents with COVID-19, CMS urges State and local leaders to consider the needs of long-term care facilities with respect to supplies of PPE and COVID-19 tests.**
 - State and local health departments should work together with long-term care facilities in their communities to determine and help address long-term care facility needs for PPE and/or COVID-19 tests.

- Medicare is now covering COVID-19 testing when furnished to eligible beneficiaries by certified laboratories. These laboratories may also choose to enter facilities to conduct COVID-19 testing.
- 3. Long-term care facilities should immediately implement symptom screening for all.**
- In accordance with previous CMS guidance, *every* individual regardless of reason entering a long-term care facility (including residents, staff, visitors, outside healthcare workers, vendors, etc.) should be asked about COVID-19 symptoms and they must also have their temperature checked. An exception to this is Emergency Medical Service (EMS) workers responding to an urgent medical need. They do not have to be screened, as they are typically screened separately.
 - Facilities should limit access points and ensure that all accessible entrances have a screening station.
 - In accordance with previous CDC guidance, *every* resident should be assessed for symptoms and have their temperature checked every day.
 - Patients and residents who enter facilities should be screened for COVID-19 through testing, if available.
- 4. Long-term care facilities should ensure all staff are using appropriate PPE when they are interacting with patients and residents, to the extent PPE is available and per CDC guidance on conservation of PPE.**
- For the duration of the state of emergency in their State, all long-term care facility personnel should wear a facemask while they are in the facility.
 - Full PPE should be worn per CDC guidelines for the care of any resident with known or suspected COVID-19 per CDC guidance on conservation of PPE.
 - If COVID-19 transmission occurs in the facility, healthcare personnel should wear full PPE for the care of all residents irrespective of COVID-19 diagnosis or symptoms.
 - Patients and residents who must regularly leave the facility for care (e.g., hemodialysis patients) should wear facemasks when outside of their rooms.
 - When possible, all long-term care facility residents, whether they have COVID-19 symptoms or not, should cover their noses and mouths when staff are in their room. Residents can use tissues for this. They could also use cloth, non-medical masks when those are available. Residents should not use medical facemasks unless they are COVID-19-positive or assumed to be COVID-19-positive.
- 5. To avoid transmission within long-term care facilities, facilities should use separate staffing teams for COVID-19-positive residents to the best of their ability, and work with State and local leaders to designate separate facilities or units within a facility to separate COVID-19 negative residents from COVID-19 positive residents and individuals with unknown COVID-19 status.**
- Long-term care facilities should exercise as best as possible consistent assignment (meaning the assignment of staff to certain patients and residents) for all patients and residents regardless of symptoms or COVID-19 status. This practice can enhance staff's familiarity with their assigned patients and residents, helping them detect emerging condition changes that unfamiliar staff may not notice. The goal is to decrease the number of different staff interacting with each patient and resident as well as the number of times those staff interact

with the patient and resident. Also, staff as much as possible should not work across units or floors.

- i. Long-term care facilities should redeploy existing training related to consistent assignment, and ensure staff are familiar with the signs and symptoms of COVID-19.
- Long-term care facilities should separate patients and residents who have COVID-19 from patients and residents who do not, or have an unknown status.
 - i. To this end, long-term care facilities should work with State and local community leaders to identify and designate facilities dedicated to patients and residents with known COVID-19-positive and those with suspected COVID-19, ensuring they are separate from patients and residents who are COVID-19-negative;
 - ii. COVID-19-positive units and facilities must be capable of maintaining strict infection control practices and testing protocols, as required by regulation;
 1. When possible, facilities should exercise consistent assignment, or have separate staffing teams for COVID-19-positive and COVID-19-negative patients.
 - iii. There may be a need for some of these COVID-19-positive long-term care facilities to have the capacity, staffing, and infrastructure to manage higher intensity patients, including ventilator management;
 - iv. State agencies including health departments, hospitals, and nursing home associations will have to ensure coordination among facilities to determine which facilities will have a designation and to provide adequate staff supplies and PPE; and, if possible, isolate all admitted residents (including readmissions) in their room in the COVID-19-positive facility for 14 days if their COVID-19 status is unknown; and
 - v. Long-term care facilities should, to the fullest extent possible, inform residents and their families of [limitations of their access](#) to and ability to leave and re-enter the facility, as well as any requirements and procedures for placement in alternative facilities for COVID-19-positive or unknown status.

###

Two or more certified long term care (LTC) facilities (SNFs and/or NFs) transfer patients between facilities to create a COVID-19 and non-COVID-19 facility. Allowed under Blanket Transfer Waiver without additional approval. Each certified facility bills Medicare for the residents in their facility.

CMS is waiving requirements in 42 CFR 483.10(c)(5); 483.15(c)(3), (c)(4)(ii), (c)(5)(i) and (iv), (c)(9), and (d); and § 483.21(a)(1)(i), (a)(2)(i), and (b) (2)(i) (with some exceptions) to allow a long term care (LTC) facility to transfer or discharge residents to another LTC facility solely for the following cohorting purposes:

- Transferring residents with symptoms of a respiratory infection or confirmed diagnosis of COVID-19 to another facility that agrees to accept each specific resident, and is dedicated to the care of such residents;
- Transferring residents without symptoms of a respiratory infection or confirmed to not have COVID-19 to another facility that agrees to accept each specific resident, and is dedicated to the care of such residents to prevent them from acquiring COVID-19; or
- Transferring residents without symptoms of a respiratory infection to another facility that agrees to accept each specific resident to observe for any signs or symptoms of a respiratory infection over 14 days.

Transfer residents from one or more certified LTC facilities to a non-certified location that is state approved and where residents must be cared for by LTC facility staff. Medicare reimbursement remains with the LTC facility caring for patients in the new location. This location could be utilized by multiple LTC facilities, providing care with their own staff.

CMS is waiving requirements related at 42 CFR 483.90, specifically the following: Provided that the state has approved the location as one that sufficiently addresses safety and comfort for patients and staff, CMS is waiving requirements under § 483.90 to allow for a non-certified LTC building to be temporarily certified and available for use by a LTC facility in the event there are needs for isolation for COVID-19 positive residents, which may not be feasible in the existing LTC facility structure to ensure care and services during treatment for COVID-19 are available while protecting other vulnerable adults.

These requirements are also waived when transferring residents to another facility, such as a COVID-19 isolation and treatment location, with the provision of services “under arrangements,” as long as it is not inconsistent with a state’s emergency preparedness or pandemic plan, or as directed by the local or state health department. In these cases, the transferring LTC facility need not issue a formal discharge, as it is still considered the provider and should bill Medicare normally for each day of care. The transferring LTC facility is then responsible for reimbursing the other provider that accepted its resident(s) during the emergency period.

**Transfer of COVID-19 residents to Federal/State run facility staffed with Federal or State personnel:
Transfers by Order of Governmental Authority (e.g., FEMA) and no reimbursement to the LTC facility.**

No waiver necessary as long as transfer is not inconsistent with a state’s emergency preparedness or pandemic plan, or as directed by the local or state health department

Long-Term Care (LTC) Respiratory Surveillance Line List

Instructions for the Long-Term Care (LTC) Respiratory Surveillance Line List

The Respiratory Surveillance Line List provides a template for data collection and active monitoring of both residents and staff during a suspected respiratory illness cluster or outbreak at a nursing home or other LTC facility. Using this tool will provide facilities with a line listing of all individuals monitored for or meeting the case definition for the outbreak illness.

Each row represents an individual resident or staff member who may have been affected by the outbreak illness (i.e., case). The information in the columns of the worksheet capture data on the case demographics, location in the facility, clinical signs/symptoms, diagnostic testing results and outcomes. While this template was developed to help with data collection for common respiratory illness outbreaks the data fields can be modified to reflect the needs of the individual facility during other outbreaks.

Information gathered on the worksheet should be used to build a case definition, determine the duration of outbreak illness, support monitoring for and rapid identification of new cases, and assist with implementation of infection control measures by identifying units where cases are occurring.

LTC Respiratory Surveillance Line List

Instruction Sheet for Completion of the Long-Term Care (LTC) Respiratory Surveillance Line List

Section A: Case Demographics

In the space provided per column, fill in each line with name, age and gender of each person affected by the current outbreak at your facility. Please differentiate residents (R) from staff (S).

***Staff includes** all healthcare personnel (e.g., nurses, physicians and other providers, therapists, food services, environmental services) whether employed, contracted, consulting or volunteer.

For residents only: Short stay (S) residents are often admitted directly from hospitals, require skilled nursing or rehabilitation care, and are expected to have a length of stay less than 100 days. Long stay (L) residents are admitted to receive residential care or nursing support and are expected to have a length of stay that is 100 days or more. Indicate the stay type for each resident in this column.

Section B: Case Location

For resident only: Indicate the building (Bldg), unit or floor where the resident is located and the room and bed number for each resident being monitored for outbreak illness. *Answers may vary by facility due to differences in the names of resident care locations.

For staff only: For each staff member listed, indicate the floor, unit or location where that staff member had been primarily working at the time of illness onset.

Section C: Signs and Symptoms (s/s)

Symptom onset date: Record the date (month/day) each person developed or reported signs/symptoms (e.g., fever, cough, shortness of breath) consistent with the outbreak illness.

Symptoms: Fill in the box (Y or N) indicating whether or not a resident or staff member experienced each of the signs/symptoms listed within this section.

Additional documented s/s (select all codes that apply): In the space provided, record the code that corresponds to any additional s/s the resident or staff member experienced. If a resident or staff member experienced a s/s that is not listed, please use the space provided by "Other" to specify the s/s.

H – headache, SB – shortness of breath, LA – loss of appetite, C – chills, ST – sore throat, O – other: Specify _____

Section D: Diagnostics

Chest x-ray: Fill in the box (Y or N) indicating whether or not a chest x-ray was performed.

Type of specimen collected: (Select all codes that apply): In the space provided, record the type of specimen collected for laboratory testing. If the type of specimen collected is not listed, please use the space provided by "Other" to specify the specimen type.

NP – nasopharyngeal swab, OP – oropharyngeal swab, S – sputum, U – urine, O – Other: Specify _____

Date of collection: Record the date (month/day) of specimen collection.

Type of test ordered (select all codes that apply): In the space provided, record the code that corresponds to whether a diagnostic laboratory test was performed for each individual. If no test was performed, indicate "zero". If the laboratory test used to identify the pathogen is not listed, please use the space provided by "Other" to specify the type of test ordered.

0 – No test performed, 1 – Culture, 2 – Polymerase Chain Reaction (PCR), also called nucleic acid amplification testing includes multiplex PCR tests for several organisms using a single specimen, 3 – Urine Antigen, 4 – Other: Specify _____

Pathogen detected (select all codes that apply): In the space provided, record the code that corresponds to the bacterial and/or viral organisms that were identified through laboratory testing. If the test performed was negative, indicate "zero". If a pathogen not listed was identified through laboratory testing, please use the space provided by "Other" to specify the organism.

0 – Negative results; Bacterial: 1 – *Streptococcus pneumoniae*, 2 – *Legionella*, 3 – *Mycoplasma*
Viral: 4 – Influenza, 5 – Respiratory syncytial virus (RSV), 6 – Human metapneumovirus (HMPV), 7 – Other: Specify _____

Section E: Outcome During Outbreak

Symptom Resolution Date: Record the date that each person recovered from the outbreak illness and was symptom free for 24 hours.

Hospitalized: Fill in the box (Y or N) indicating whether or not hospitalization was required for a resident or staff member during the outbreak period. **Note: The outbreak period is the time from the date of symptom onset for the first case to date of symptom resolution for the last case.**

Died: Fill in the box (Y or N) indicating whether or not a resident or staff member expired during the outbreak period.

Case (C) or Not a case (leave blank): Based on the clinical criteria and laboratory findings collected during the outbreak investigation, record whether or not each resident or staff member meets the case definition (C) or is not a case (leave space blank).

LTC Respiratory Surveillance Line List

Date: ___/___/___

This worksheet was created to help nursing homes and other LTC facilities detect, characterize and investigate a possible outbreak of respiratory illness.

A. Case Demographics			B. Case Location			C. Signs and Symptoms (s/s)			D. Diagnostics			E. Outcome During Outbreak ^A

If faxing to your local Public Health Department, please complete the following information:

Facility Name: _____ City, State: _____ County: _____

Contact Person: _____ Phone: _____ Email: _____

^A **Note:** Outbreak defined as date of first case to resolution of last case.

^B **Definition of Fever** (Stone N, Ashraf MS, Calder, J, et al. Surveillance Definitions in Long-Term Care Facilities: Revisiting the McGeer Criteria. Infect Control Hosp Epidemiol 2012; 33:965-977):

(1) a single oral temp > 37.8°C (100°F) or (2) repeated oral temps > 37.2°C (99°F) or rectal temps > 37.5°C (99.5°F) or (3) a single temp > 1.1°C (2°F) over baseline from any site (oral, tympanic, axillary).

Long-Term Care (LTC) Respiratory Surveillance Outbreak Summary

Instructions for the Long-Term Care (LTC) Respiratory Surveillance Outbreak Summary

The Respiratory Outbreak Summary Form was created to help nursing homes and other LTC providers summarize the findings, actions and outcomes of an outbreak investigation and response. Completing this outbreak form will provide LTC facilities and other public health partners with a record of a facility's outbreak experience and highlight areas for outbreak prevention and response.

Instructions for each section of the form are described below. This form should be filled out by the designated infection preventionist with support from other clinicians in your facility (e.g., front-line nursing staff, physicians or other practitioners, consultant pharmacist, laboratory).

A LTC facility can use this form for internal documentation and dissemination of outbreak response activities. Facilities are encouraged to share this information with the appropriate public health authority by contacting the local health department. Should a facility decide to share this form with the local/state public health officials, please include facility contact information at the bottom of the form.

LTC Respiratory Surveillance Outbreak Summary

Section 1: Facility Information

Health Dept. Contact Name and Phone Number: A LTC facility should have contact information (name or division, phone number) for the local and/or state health department for outbreak guidance and reporting purposes. Enter the health dept. contact information your facility used to request support during an outbreak.

Date First Notified Local Health Dept: Record the date you first contacted local or state public health during this outbreak at your facility.

Total # of residents at facility: Document the total number of residents in the facility at the time of the outbreak.

Total # of employees: Document the total number of staff working in the facility at the time of the outbreak. Staff includes all healthcare personnel (e.g., nurses, providers, consultants, therapists, food services, environmental services) whether employed, contracted or volunteer.

Summary Form Status: Information in the summary form may be completed over the course of the outbreak. Record the dates your facility started collecting information on the form and completed the outbreak summary report.

Section 2: Influenza Vaccination Status

Total # of residents vaccinated: Record the total number of residents that received the Flu Vaccine within the past year.

Total # of staff vaccinated: Record the total number of staff that received the Flu Vaccine within the past year.

Section 3: Pneumococcal Vaccination Status

Total # of residents vaccinated: Record the total number of residents that received at least one dose of the Pneumococcal Vaccine (either polysaccharide or conjugate).

Section 4: Case Definition

Provide a description of the criteria used to determine whether a resident should be considered a case in this outbreak. The description can include: signs/symptoms, presence of positive diagnostic tests, location within facility, and the timeframe during which individuals may have been involved in the outbreak (e.g., within the past 4 weeks).

Example: A Respiratory illness case includes any resident with the following symptoms: cough, shortness of breath, sputum production and fever residing on Units 2E or 2W, with onset of symptoms between Jan 15th and Feb 1st with or without a sputum specimen positive for Streptococcus pneumoniae.

Section 5: Outbreak Period Information

Outbreak start: (Date of symptom onset of first case): Record the date the first person developed signs/symptoms (e.g., fever, cough, shortness of breath) consistent with the outbreak illness.

Average length of illness: Estimate the average number of days it takes for signs/symptoms to resolve, based on clinical course among residents/staff affected by the outbreak illness.

Outbreak end: (Symptom resolution date of last case): Record the date the last person recovered from the outbreak illness and became symptom free for 24 hours.

Total # of Cases: Document the number of residents and staff (if applicable) who were identified as having the outbreak illness.

LTC Respiratory Surveillance Outbreak Summary

Section 6: Staff Information

Were any ill staff delivering resident care? Check yes or no.

- If yes, try to estimate the number of ill staff involved in resident care based on date when a staff member reported symptoms compared with the date when/if staff member was excused from work.

Did any staff seek medical attention for an acute respiratory infection at any time during the outbreak? Check yes or no.

- If yes, try to estimate the number of staff that sought medical attention based on self-report.

If available, indicate if ill staff received care at an emergency department (ED). Check yes or no and estimate number of staff.

If available, indicate if ill staff was hospitalized as a result of the outbreak illness. Check yes or no and estimate number of staff.

Section 7: Diagnostic and Laboratory Tests

Chest x-ray: Fill in the box (yes or no) indicating whether or not residents and staff had an x-ray done as a part of the diagnosis of the outbreak illness. If yes, please record the # of individuals who received chest x-ray and the # of x-rays that had abnormal findings consistent with the outbreak illness.

List all bacterial (e.g., *S. pneumoniae*, *Mycoplasma*); viral (e.g., Influenza, RSV) organisms that were identified through laboratory testing; Use the space provided by "Other" to specify if a parasite or non-infectious cause of respiratory illness was identified.

Diagnostic testing results: In the table, each row corresponds to an organism identified during the outbreak. Use the column to specify the type of testing used to identify each organism (either microbiologic culture, PCR (also known as nucleic acid amplification) or specify if a different diagnostic test was used (e.g., Legionella urinary antigen). For each test type, document the total number of residents and staff that received laboratory confirmation by that test.

Section 8: If Influenza Identified During Outbreak:

Antiviral Treatment: Fill in the box (yes or no) indicating whether or not antiviral treatment was offered. If antiviral treatment was offered, please record the total number of residents and staff that received treatment.

Antiviral Prophylaxis Offered: Fill in the box (yes or no) indicating whether or not antiviral prophylaxis was offered to any additional residents, staff or family members at risk for infection due to the outbreak. If antiviral prophylaxis was offered, please record the total number of residents and staff that received prophylaxis.

Section 9: Resident Outcome

Hospitalizations: During the outbreak, fill in the box (yes or no) indicating whether or not hospitalization was required for any residents. If yes, please record how many residents were hospitalized.

Deaths: During the outbreak, fill in the box (yes or no) indicating whether or not any residents died. If yes, please record how many residents died during the outbreak period (deaths should be recorded even if unable to determine if outbreak illness was the cause).

Section 10: Facility Outbreak Control Interventions

In this section, check if any of the infection control strategies listed were implemented at your facility in response to the outbreak. If a practice or policy change was implemented during the outbreak that is not listed (e.g., new cleaning/disinfecting products used, change to employee sick leave policy), specify in the space provided by "Other". For each strategy, record the date the change was implemented (if available).

Section 11: # of New Cases Per Day

Please fill in the chart with the number of new cases that are residents and staff per day. Once each day is complete, add the number of new cases of residents and staff and place the sum in total column for that corresponding day.

In the space provided under the chart, record the date which corresponds to Day 1 on the outbreak period (i.e., date of outbreak start).

For HD Use Only	
<p>Facility Licensed by State: Fill in the box (yes or no) indicating whether or not the facility is licensed by the state.</p>	<p># of Licensed Beds: Document the total number of licensed beds at the facility.</p>
<p>Facility Certified by CMS: Fill in the box (yes or no) indicating whether or not the facility is certified by the Center for Medicare and Medicaid Services (CMS).</p>	<p># of staff employees: Document the total number of facility employed staff working in the facility at the time of the outbreak.</p>
<p>Facility Type: Check that box that best describes the type of care the facility provides: Nursing home, Intermediate Care Facility, Assisted living Facility or Other (specify).</p>	<p># of contract employees: Document the total number of contract/consulting providers working in the facility at the time of the outbreak.</p>

Coronavirus Disease (COVID-19) – Surge Capacity Staffing

Policy Statement

When staffing shortages are anticipated, the director of human resources (DHR), in collaboration with the director of nursing services (DNS), will use contingency capacity strategies to ensure staffing needs are met.

Policy Interpretation and Implementation

1. In order to provide a safe working environment and sufficient coverage for resident care, the DHR and the DNS collaborate to understand and anticipate the staffing needs of this facility.
2. The DHR communicates with the health department, emergency planning agencies and healthcare coalitions (state and local) to identify available options for additional staffing.

Contingency Staffing Strategies

Contingency staffing strategies are adopted when staffing shortages are anticipated. Contingency strategies are based on current guidelines from the CDC and CMS and include:

1. Adjusting schedules, hiring additional staff and rotating positions including:
 - a. cancelling non-essential procedures;
 - b. cross-training staff so that they can be reassigned to essential resident care functions;
 - c. addressing social factors, such as childcare issues and transportation by offering flexible scheduling and accommodation of adjusted hours to the extent possible;
 - d. identifying sources of additional licensed and non-licensed staff (e.g., healthcare coalitions, collaboration with other facilities, etc.); and
 - e. asking staff to postpone elected time off.
2. Identifying outside facilities that have been designated as isolation or alternate care sites with appropriate levels of staff.
3. Allowing asymptomatic staff who have been exposed to COVID-19 to continue working when:
 - a. they report normal temperature and lack of symptoms every day before reporting to work;
 - b. they wear a facemask at work for 14 days after the exposure event; and
 - c. they agree to stop any resident care activities, report to their supervisor, and leave the facility if (even mild) symptoms develop.
4. Prioritizing exposed and symptomatic personnel for testing. When personnel are tested and found to be infected with SARS-CoV-2 they are excluded from work until they meet all Return to Work Criteria unless staffing shortages continue despite other mitigation strategies and certain criteria are met.
5. Allowing staff with suspected or confirmed COVID-19 infection (who are well enough to work) to return to work before all Return to Work Criteria have been met is based on the following considerations:
 - a. The type of staffing shortages that need to be addressed;
 - b. Where the individual is in the course of their illness (e.g., viral shedding appears to be higher earlier in the course of illness);

continues on next page

- c. The types of symptoms they are experiencing (e.g., persistent fever);
 - d. Their degree of interaction and contact with residents and other staff in the facility; and
 - e. The type of residents they typically care for (e.g., immunocompromised patients).
6. Notifying residents, family and other staff members of measures that will be taken to protect them from exposure if staff with suspected or confirmed COVID-19 are allowed to work.

Crisis Staffing Strategies

Crisis staffing strategies are implemented if staffing shortages are interfering with safe resident care. Crisis strategies are based on current guidelines from the CDC and CMS and include:

1. Implementing regional plans to transfer residents with COVID-19 to designated healthcare facilities, isolation sites or alternate care sites with adequate staffing.
2. If not already done, allowing asymptomatic staff who have had an unprotected exposure to COVID-19 to continue to work. These individuals will:
 - a. report temperature and absence of symptoms each day before starting work;
 - b. wear a facemask while at work for the 14 days after the exposure event;
 - c. stop resident care activities and notify their supervisor and leave the facility if even mild symptoms consistent with COVID-19 develop; and
 - d. be prioritized for testing.
3. If shortages continue despite other mitigation strategies, implementing criteria to allow staff with suspected or confirmed COVID-19 (who are well enough to work but have not met all Return to Work Criteria) to work.
4. If staff are allowed to work before meeting all Return to Work Criteria, restricting them from contact with severely immunocompromised patients and prioritizing their duties in the following order:
 - a. If not already done, allowing staff with suspected or confirmed COVID-19 to perform job duties where they do not interact with others, such as in telemedicine services.
 - b. Allow staff with confirmed COVID-19 to provide direct care only for residents with confirmed COVID-19, preferably in a cohort setting.
 - c. Allow staff with confirmed COVID-19 to provide direct care for residents with suspected COVID-19.
 - d. As a last resort, allow staff with confirmed COVID-19 to provide direct care for residents without suspected or confirmed COVID-19.
5. If staff are permitted to return to work before meeting all Return to Work Criteria, requiring adherence to all return to work practices and work restrictions recommendations described in that guidance. These include:
 - a. wearing a facemask at all times while in the healthcare facility until all symptoms are completely resolved or until 14 days after illness onset, whichever is longer;
 - b. reminding them that in addition to potentially exposing residents, they could also expose their co-workers:
 - (1) Facemasks will be worn even when they are in non-resident care areas such as breakrooms; and
 - (2) If they must remove their facemask, for example, in order to eat or drink, they are asked to separate themselves from others.
 - c. restricting them from contact with severely immunocompromised patients until the full Return to Work Criteria have been met;

continues on next page

- d. adhering to hand hygiene and respiratory hygiene, and cough etiquette (e.g., cover nose and mouth when coughing or sneezing, dispose of tissues in waste receptacles); and
- e. self-monitoring for symptoms and seeking re-evaluation from occupational health if respiratory symptoms recur or worsen.

Coronavirus Disease (COVID-19) – Vaccination of Residents and Staff

Policy Statement

This facility has partnered with _____ pharmacy to provide on-site COVID-19 vaccination for residents and staff.

Policy Interpretation and Implementation

1. This facility is enrolled in the Pharmacy Partnership for Long-Term Care (LTC) Program with the pharmacy partner indicated above.
2. The pharmacy partner administering the vaccine is responsible for:
 - a. procurement of the vaccine dose;
 - b. supply chain storage and handling;
 - c. providing current EUA fact sheets specific to the vaccine;
 - d. obtaining and documenting consent for the vaccine;
 - e. administering the vaccine;
 - f. documenting the vaccine administration; and
 - g. reporting all required individual data elements to local, state/territorial and federal jurisdictions within 72 hours of administering each dose.
3. Facility staff may assist the pharmacy partner with:
 - a. coordinating dates and times for on-site clinics;
 - b. scheduling residents and staff;
 - c. gathering and reporting demographic information, allergies, health conditions, insurance information, etc.;
 - d. reviewing information, answering questions and assisting with obtaining consent;
 - e. retrieving and escorting residents for appointments;
 - f. observing residents and staff after doses;
 - g. assisting with V-safe downloads and reporting; and
 - h. submitting reports of adverse events following COVID-19 vaccination to the Vaccine Adverse Event Reporting System (VAERS).
4. Residents and staff who are eligible to receive the COVID-19 vaccine are strongly encouraged to do so.
5. The COVID-19 is provided free of charge. The pharmacy partner is authorized to bill private insurance, Medicare or Medicaid for an administration fee.
6. Individuals must consent to receiving the vaccine prior to administering. Resident consent (verbal or written) is documented in the resident's medical record. Staff consent is documented in the employee health record.
7. Residents (or representatives) and staff receive information about the vaccine and an opportunity to ask questions prior to consent. Information provided includes Emergency-Use Authorization (EUA) Fact Sheets specific to the vaccine he or she will receive which explains:
 - a. the risks and benefits of the vaccine;

continues on next page

- b. contraindications to receiving the vaccine; and
 - c. potential side effects and adverse reactions.
8. Individuals with contraindications to the COVID-19 vaccine are not given the vaccine unless they have been evaluated by an allergist-immunologist and it is determined that the person can safely receive the vaccine (e.g., under observation, in a setting with advanced medical care available).
 9. The following are considered contraindications to COVID-19 vaccines:
 - a. severe allergic reaction (e.g., anaphylaxis) after a previous dose of an mRNA COVID-19 vaccine or any of its components;
 - b. immediate allergic reaction of any severity to a previous dose of an mRNA COVID-19 vaccine or any of its components (including polyethylene glycol [PEG]); and/or
 - c. immediate allergic reaction of any severity to polysorbate (due to potential cross-reactive hypersensitivity with the vaccine ingredient PEG).
 10. When COVID-19 vaccines are administered in two (2) doses individuals who receive the first vaccine dose are automatically scheduled for a second dose.
 - a. The second dose of the Pfizer-BioNTech vaccine is administered no sooner than 21 days after the first dose.
 - b. The second dose of the Moderna vaccine is administered no sooner than 28 days after the first dose.
 - c. Second doses of either vaccine are given no later than 6 weeks (42 days) after the first dose.
 11. The [CDC Covid-19 Vaccine Product Information](#) page is reviewed for updates on vaccines and EUA Fact Sheets as they become available.
 12. Covid-19 vaccines are not administered within 14 days of any other vaccines.
 13. To administer COVID-19 vaccines to our residents and staff, a provider must have and be in compliance with the [CDC Covid-19 Vaccination Program Provider Agreement](#).
 14. Facility staff does NOT administer COVID-19 vaccines unless the facility is enrolled with the jurisdiction (state or county) as a COVID-19 vaccination provider.
 15. At the conclusion of the [Pharmacy Partnership for Long-Term Care \(LTC\) Program](#) (estimated March 2021), the facility will continue receiving COVID-19 vaccines by contracting with a LTC pharmacy that is enrolled as a COVID-19 vaccine provider with the [state/territory](#) or through the [Federal Retail Pharmacy Program](#) for COVID-19 vaccination.
 16. Questions regarding the COVID-19 vaccine or the vaccine program are handled by the infection preventionist.

Sample Letter to Residents:

A message from: *<Name of Facility's Administrator>*

Dear Resident:

Thank you for everything you do to protect yourself and others from getting COVID-19. As many of you know, residents of long-term care facilities are now recommended to receive COVID-19 vaccines. Making sure you get vaccinated early can help save your life and protect the lives of others, as you have the highest risk for infection and severe illness from COVID-19. We care about your health. Getting vaccinated is an important step to prevent getting sick with COVID-19 disease.

To offer convenient access to the vaccine, we have partnered with *<insert provider name>* to provide on-site COVID-19 vaccination for residents and staff free of charge. Please watch for additional information about on-site vaccination clinics in the coming weeks. When you agree to get vaccinated, this will be documented in your medical chart. We will work directly with *<provider name>* to ensure you also receive a fact sheet before vaccination, explaining the risks and benefits of the COVID-19 vaccine. This is called an Emergency Use Authorization (EUA) Fact Sheet.

We understand you may have questions about the vaccine. After getting vaccinated, you may have some side effects, which are normal signs that your body is building protection. The most common side effects are pain at the injection site, fever, and chills. These side effects tend to be mild to moderate and go away on their own within 1–2 days.

We will work with you to report any health problems that occur after vaccination. We call these types of health problems possible side effects or adverse events. In addition, we are encouraging residents who have a smartphone to enroll in v-safe, a tool that can be used to tell CDC if someone has any side effects after getting a COVID-19 vaccine.

COVID-19 vaccines are an important tool to help stop the pandemic. However, even after vaccination, everyone will need to continue following all the current guidance to protect themselves and others, including wearing a mask, staying at least 6 feet away from others, following facility and community guidance on visitation and infection control, and cleaning hands often.

Thank you again for all you are doing to stay safe. We will continue to update you on any new information about COVID-19 vaccination.

Please contact us with additional questions at *<insert contact information>*.

Sincerely,

<Name of Facility's Administrator/Medical Manager>

Anemia – Clinical Protocol

Assessment and Recognition

1. The nursing staff and physician will identify individuals with a history of anemia; for example, recent hospitalization with postoperative anemia, anemia associated with chronic renal failure, or an incidental finding of borderline low hemoglobin and/or hematocrit.
2. Nursing assessment will include:
 - a. Vital signs;
 - b. General appearance and assessment of select body systems (cardiac, pulmonary, abdomen, neurological);
 - c. Blood sugar if resident is a diabetic; urine clarity and color;
 - d. Any signs or symptoms of infection/acute illness including dehydration;
 - e. Description of current bowel and bladder function;
 - f. Assessment for bruising or any other signs of an unreported/unwitnessed fall;
 - g. Pain assessment;
 - h. Assessment for change in mood, behavior, orientation or alertness;
 - i. Resident's age and sex;
 - j. Intake and output history over 24 hours;
 - k. All current medications, any recent changes in medications and allergies;
 - l. History related to condition;
 - m. All active diagnoses; and
 - n. Any recent labs.
3. The nursing staff and physician will identify individuals who are at risk for developing anemia; for example, those with a history of gastrointestinal bleeding, nutritional deficiencies, cancer or malabsorption, or those receiving medications such as chemotherapy that may affect absorption or utilization of nutrients.
4. The nursing staff and physician will identify signs and symptoms suggesting possible complications of anemia; for example, glossitis, stomatitis, peripheral neuropathy, activity intolerance or fatigue, dizziness or lightheadedness, or refractory congestive heart failure.

Cause Identification

1. Based on the assessment and on consideration of possible causes, the physician will order appropriate diagnostic tests to assess the category, causes, and severity of anemia; for example, iron, iron-binding capacity, serum ferritin, reticulocyte count, vitamin B12 and folate, thyroid function, urinalysis, stools for occult blood, or other indicated tests.
2. Based on the assessment and test results, the physician will identify the category (blood loss, increased red blood cell destruction, decreased production or bone marrow failure, or mixed), severity, likely causes, and associated disorders (for example, pancytopenia).
3. Depending on these preliminary results, the physician will identify additional consultations or tests such as radiologic or endoscopic evaluation of the gastrointestinal tract, urinary cytology, or bone marrow aspiration.

continues on next page

Treatment/ Management

1. The physician will identify appropriate cause-specific and symptomatic interventions.
 - a. For example, these might include iron or vitamin/mineral supplementation to treat nutritional deficiency, stopping or adjusting medications that may be causing bleeding (such as nonsteroidal anti-inflammatory drugs [NSAIDs] or coumadin) or hemolysis, treating conditions associated with bleeding (for example, ulcerative colitis or gastritis) or treating a urinary tract infection associated with hematuria.
2. The physician will document when the underlying cause of anemia is irreversible or only partially correctable; for example, anemia due to bone marrow failure or leukemia, anemia of chronic disease, resident advance directives rejecting transfusions, etc.
3. The physician will identify situations where blood transfusions are appropriate, based on the severity of symptoms or other pertinent factors.
4. Use of any medications to treat anemia should be based on appropriate indications.
 - a. Erythropoietin use should be limited to appropriate indications; for example, individuals with cancer who are receiving chemotherapy or those who have anemia due to end-stage renal disease. Additionally, duration of erythropoietin use should be based on prescribing information, FDA warnings, and consideration of additional relevant factors such as the individual's prognosis, underlying causes of anemia, and monitoring of hemoglobin/hematocrit.

Monitoring and Follow-Up

1. The staff and physician will monitor the individual with anemia; for example, by observing function, monitoring for dyspnea or edema, follow-up lab tests, etc.
2. The physician will continue, adjust, or stop treatments based on the resident's responses and the status of underlying conditions.

Quality Assurance and Performance Improvement (QAPI) Program

Policy Statement

This facility shall develop, implement, and maintain an ongoing, facility-wide, data-driven QAPI program that is focused on indicators of the outcomes of care and quality of life for our residents.

Policy Interpretation and Implementation

The objectives of the QAPI Program are to:

1. provide a means to measure current and potential indicators for outcomes of care and quality of life.
2. provide a means to establish and implement performance improvement projects to correct identified negative or problematic indicators.
3. reinforce and build upon effective systems and processes related to the delivery of quality care and services.
4. establish systems through which to monitor and evaluate corrective actions.

Authority

1. The owner and/or governing board (body) of our facility is ultimately responsible for the QAPI program.
2. The governing board/owner evaluates the effectiveness of its QAPI program at least annually and presents findings to the QAPI committee.
3. The administrator is responsible for assuring that this facility's QAPI program complies with federal, state, and local regulatory agency requirements.
4. The QAPI committee reports directly to the administrator.

Implementation

1. The QAPI committee oversees implementation of our QAPI plan, which is the written component describing the specifics of the QAPI program, how the facility will conduct its QAPI functions, and the activities of the QAPI committee.
2. The QAPI plan describes the process for identifying and correcting quality deficiencies. Key components of this process include:
 - a. tracking and measuring performance;
 - b. establishing goals and thresholds for performance measurement;
 - c. identifying and prioritizing quality deficiencies;
 - d. systematically analyzing underlying causes of systemic quality deficiencies;
 - e. developing and implementing corrective action or performance improvement activities; and
 - f. monitoring or evaluating the effectiveness of corrective action/performance improvement activities, and revising as needed.

continues on next page

3. The committee meets monthly to review reports, evaluate data, and monitor QAPI-related activities and make adjustments to the plan.

Disclosure of Information

1. Information regarding QAPI activities may be disclosed only in accordance with applicable laws and regulations.
2. The QAPI plan is presented to the state survey agency annually during the recertification survey, and as requested during any other survey or by CMS.
3. Protection from disclosure is generally afforded documents generated by the QAPI committee, such as minutes, internal papers, or conclusions, unless these documents contain the evidence necessary to determine compliance with QAPI regulations.
 - a. Surveyors may require facilities to disclose QAPI committee records (which they may review and copy) to determine the extent to which facilities are compliant with QAPI regulations.
 - b. Surveyors may not use this information as a basis to cite new deficiencies, or to expand the scope and severity of already identified concerns.
4. Incident and accident reports, wound logs, or other reports or records used to track adverse events are not protected from disclosure. Surveyors may request these documents as part of their normal investigation of other areas of concern throughout the survey to support their findings.
5. Only documents and information covered under The Federal Patient Safety and Quality Improvement Act of 2005 (“patient safety work product”) and are part of a patient safety evaluation system (PSES) are protected from disclosure.

Coordination

1. The QAPI coordinator manages QAPI committee activities and changes to the QAPI plan.
2. The QAPI coordinator assists other committees, individuals, departments, and/or services in developing quality indicators, monitoring tools, assessment methodologies and documentation, and in making adjustments to the plan.
3. The QAPI coordinator serves as a liaison between the QAPI committee and individuals, services, and/or departments regarding QAPI activities.

Quality Assurance and Performance Improvement (QAPI) Program – Analysis and Action

Policy Statement

Quality deficiencies that are identified through feedback and data and will undergo appropriate corrective action. Corrective actions are monitored against established goals and benchmarks by the QAPI committee.

Policy Interpretation and Implementation

1. The QAPI program, overseen by the QAPI committee is designed to identify and address quality deficiencies through the analysis of the underlying cause and actions targeted at correcting systems at a comprehensive level.
2. The methodology for analysis and action is guided by a written QAPI plan that includes:
 - a. definition of the problem, based on information obtained through data, self-assessment and feedback systems.
 - b. an analysis of the root cause of the problem from a systems perspective.
 - c. establishing measurable goals or benchmarks for improvement.
 - d. specific interventions aimed at correcting the problem and achieving the stated goals or benchmarks.
 - e. methods and frequency of monitoring performance improvement objectives.
3. The QAPI committee is responsible for analyzing identified problems, establishing corrective actions, measuring progress against the established goals and benchmarks, communicating information to staff and residents, and reporting findings to the administrator and governing board.

Quality Assurance and Performance Improvement (QAPI) Program – Design and Scope

Policy Statement

The facility QAPI program is ongoing, comprehensive and addresses all care and services provided by the facility. The scope of our performance improvement efforts is reflective of the complexity of services and resources of the organization.

Policy Interpretation and Implementation

1. The QAPI program is designed to address all systems and practices in this facility that affect residents, including clinical care, quality of life, resident choice and safety.
2. The indicators of quality are defined and measured based on the current evidence supporting the best indicators of desired outcomes for residents in nursing facilities.
3. The indicators of quality for this facility reflect the care and services provided that are unique to our facility and resident population, as identified in the facility assessment.
4. The QAPI functions prioritize identified problem areas that are high-risk, high volume and/or problem prone.
 - a. **“High Risk.”** Refers to care or service areas associated with significant risk to the health or safety of residents, e.g., tracheostomy care; pressure injury prevention; administration of high risk medications such as warfarin, insulin, and opioids.
 - b. **“High Volume.”** Refers to care or service areas performed frequently or affecting a large population, thus increasing the scope of the problem, e.g., transcription of orders; medication administration; laboratory testing.
 - c. **“Problem-prone.”** Refers to care or service areas that have historically had repeated problems, e.g., call bell response times; staff turnover; lost laundry.

Quality Assurance and Performance Improvement (QAPI) Program – Feedback, Data and Monitoring

Policy Statement

The QAPI program is based on the collection information obtained from data, self-assessment and systems of feedback. Information is collected, evaluated and monitored by the QAPI committee.

Policy Interpretation and Implementation

1. Information obtained about the quality of care and services delivered to residents is evaluated and monitored by the QAPI committee in order to identify problems that are high risk, high volume or problem prone and to guide decisions regarding opportunities for improvement.
2. The QAPI process focuses on identifying systems and processes that may be problematic and could be contributing to avoidable negative outcomes related to resident care, quality of life, resident safety, resident choice or resident autonomy, and on making a good faith effort to correct or mitigate these outcomes.
3. Systems and tools used to identify, collect and evaluate data from all departments to monitor performance indicators include, but are not limited to the following:
 - a. Self-assessment tools:
 - Ongoing facility assessment
 - Monthly resident census data
 - Annual Survey results
 - QAPI self-assessment tools
 - b. Data collection tools:
 - Monthly surveillance reports for quality of care indicators
 - Monthly quality measures reports
 - Monthly staff turnover reports
 - Monthly summary of accident and incident reports (and/or other adverse event tracking tools)
 - c. Feedback from staff, residents and families:
 - Resident and family satisfaction surveys
 - Staff suggestions and exit interviews
 - Feedback from resident council meetings
 - Complaint survey results
4. Data and information collected are reviewed by the committee and prioritized according to the risk, volume, and potential problems.
5. Root cause analysis is conducted to identify problematic processes and systems that need to be addressed.
6. Corrective actions and performance improvement activities are initiated and monitored. The committee tracks and documents the progress of existing initiatives as well as newly identified ones, as part of the ongoing QAPI process.
7. The number and scope of performance improvement activities reflect the scope and complexity of this organization's services and available resources, as identified in the facility assessment.

continues on next page

8. The QAPI program is committed to no less than one project annually that focuses on a high-risk or problem-prone area identified through data collection and analysis.

Quality Assurance and Performance Improvement (QAPI) Program – Governance and Leadership

Policy Statement

The quality assurance and performance improvement program is overseen and implemented by the QAPI committee, which reports its findings, actions and results to the administrator and governing body.

Policy Interpretation and Implementation

1. The administrator, whether a member of the QAPI committee or not, is ultimately responsible for the QAPI program, and for interpreting its results and findings to the governing body.
2. The governing body is responsible for ensuring that the QAPI program:
 - a. is implemented and maintained to address identified priorities;
 - b. is sustained through transitions of leadership and staffing;
 - c. is adequately resourced and funded, including the provision of money, time, equipment, training and staff coverage sufficient to conduct the activities of the program;
 - d. is based on data, resident and staff input, and other information that measures performance; and
 - e. focuses on problems and opportunities that reflect processes, functions and services provided to the residents.
3. The QAPI coordinator coordinates the activities of the QAPI committee.
4. The responsibilities of the QAPI committee are to:
 - a. collect and analyze performance indicator data and other information;
 - b. identify, evaluate, monitor and improve facility systems and processes that support the delivery of care and services;
 - c. identify and help to resolve negative outcomes and/or care quality problems identified during the QAPI process;
 - d. utilize root cause analysis to help identify where identified problems point to underlying systematic problems;
 - e. help departments, consultants and ancillary services implement systems to correct potential and actual issues in quality of care;
 - f. establish benchmarks and goals by which to measure performance improvement;
 - g. coordinate the development, implementation, monitoring, and evaluation of performance improvement projects to achieve specific goals; and
 - h. communicate all phases of the QAPI process to the administrator and governing body through sharing meeting minutes, committee activities and results of QAPI activities.
5. The committee has the full authority to oversee the implementation of the QAPI program, including, but not limited to, the following:
 - a. Establishing performance and outcome indicators for quality of care and services delivered in the facility;
 - b. Choosing and implementing tools that best capture and measure data about the chosen indicators;

continues on next page

- c. Appropriately interpreting data within the context of standards of care, benchmarks, targets and the strengths and challenges of the facility; and
 - d. Communicating the information gathered and their interpretation to the owner/governing board (body).
6. The following individuals serve on the committee:
- a. Administrator, or a designee who is in a leadership role;
 - b. Director of nursing services;
 - c. Medical director;
 - d. Infection preventionist; and
 - e. Representatives of the following departments, as requested by the administrator:
 - (1) Pharmacy;
 - (2) Social services;
 - (3) Activity services;
 - (4) Environmental services;
 - (5) Human resources; and
 - (6) Medical records.
7. The committee meets at least quarterly (or more often as necessary). Committee members are reminded of meeting day, time and location via e-mail at least two business days prior to the meeting.
8. Special meetings may be called by the administrator as needed to present issues that need to be addressed before the next regularly scheduled meeting.

Alcoholic Beverages

Level II

Purpose

The purpose of this procedure is to establish uniform guidelines concerning the administration of alcoholic beverages.

General Guidelines

1. A physician's order must be received before any alcoholic beverage may be administered to a resident.
2. Should such an order be received, the Nurse Supervisor receiving the order must contact the pharmacist to determine if any of the resident's current medications would interact with alcohol.
3. Should there be a medication that would interact with the alcohol, the Nurse Supervisor must inform the physician of such medication.
4. Record and follow the physician's instructions.
5. Alcoholic beverages must be paid for by the resident, his family, and/or the resident's representative (sponsor).
6. The Nurse Supervisor receiving the alcoholic beverage must label the bottle.
7. The label must contain:
 - a. The resident's name and room number.
 - b. The exact dosage to be administered.
 - c. The time(s) each dose is to be administered.
 - d. The name of the physician.
8. Alcoholic beverages must be treated as medication and stored in the medicine room.
9. Should you have any doubt concerning the administration of the beverage to the resident, contact the Director of Nursing Services.

Joint Mobility Screen (MP5478)

Dysphagia – Clinical Protocol

Assessment and Recognition

1. The staff and physician will identify individuals with a history of swallowing difficulties or related diagnoses such as dysphagia, as well as individuals who currently have difficulty chewing or swallowing food.
2. Based on the information collected and correlated by various disciplines, the staff and practitioner, in conjunction with the SLP, will define the situation carefully (for example, differentiate coughing, choking, wheezing, and aspirating; identify the circumstances, details and frequency and severity of any episodes, presence of a feeding tube, and other related information) and whether the situation needs additional evaluation and clarification.
3. If a swallowing problem is identified or suspected, a healthcare practitioner, in conjunction with nursing and the SLP, will identify and document pertinent information, including the resident/patient's:
 - a. level of consciousness;
 - b. ability to swallow 3 ounces of water without drooling, coughing or choking (unless contraindicated by clinical evidence);
 - c. previous and recent history of swallowing capability and difficulty;
 - d. ability to follow commands;
 - e. condition, function, gross strength and coordination of muscles of the face, mouth and tongue;
 - f. pulse oximetry during or after eating or drinking, compared to usual baseline; and
 - g. where feasible, asking specific questions related to swallowing (for example, using the EAT-10 screen or comparable questions) from the patient's perspective.

Cause Identification

1. It is important to clarify the symptoms and the history in detail in order to help identify causes, since symptoms related to chewing or swallowing may have modifiable causes.
2. Correct cause identification is the foundation for pertinent interventions. The healthcare practitioner should address should obtain symptom details and try to clarify the nature and causes of the problem and not simply order a speech therapy evaluation.
3. In most cases, causal factors should be clarified before instituting significant dietary restrictions. Exceptions might include individuals with obvious inability to clear saliva or swallow food or liquids.
4. Medical and other causes of dysphagia, coughing, or choking can include:
 - a. oral and dental disorders;
 - b. thyroid disorders (including thyroiditis);
 - c. oropharyngeal and esophageal disorders (including pharyngitis, esophageal spasm, malignancy, stricture, and candida esophagitis);
 - d. gastroesophageal reflux disease;
 - e. medication side effects; for example, including aspirin and other nonsteroidal anti-inflammatory drugs, corticosteroids, chemotherapy agents, antipsychotics, antidepressants, ACE inhibitors, antibiotics, cholinesterase inhibitors, seizure medications, and proton pump inhibitors; and
 - f. psychiatric disorders (anxiety, depression, and various personality disorders).

continues on next page

Treatment/Management

1. Taking into account the entire picture (not just a test result or a symptom), the interdisciplinary team (including the medical practitioner) will define the resident / patient's situation, including causes, complications, and benefits and risks.
 - a. Relevant findings include the resident/patient's overall condition and nutritional status; identified and suspected causes of swallowing difficulty and related issues; overall prognosis, quality of life considerations, resident/patient goals and wishes (for example, as documented in advance directives and/or living wills); results of swallowing evaluation and studies; and review of whether various alternatives are available, feasible, or have already been tried.
 - b. The risks and benefits of allowing individuals to eat and drink must be weighed appropriately. Swallowing abnormalities are common, but do not necessarily imply that there is a problem needing an intervention or a limitation.
2. The staff and physician will first try to identify and implement simple interventions to manage the situation; for example, cutting food into smaller pieces, allowing the individual to eat more slowly, addressing oral and dental problems, or addressing factors that make the individual less attentive or drowsy during meals.
3. The physician will address underlying medical conditions causing or contributing directly or indirectly to cough or difficulty eating, chewing, or swallowing; for example, treat esophagitis, address medical conditions affecting mental status or level of consciousness, or reduce, change, or stop medications associated with dry mouth, confusion, dyspepsia, altered level of consciousness, coughing, or dysphagia.
4. The staff and practitioners will identify and document patient choice. If a resident/patient or family decline recommendations for a downgraded diet, the staff or physician will document this in the medical record.
 - a. Resident/patient wishes regarding diet, including its content and consistency, should weigh heavily when considering possible restrictions.
 - b. The risk of clinically significant complications such as aspiration pneumonia should be presented in the same balanced context as any other risk factors.
5. If a modified consistency diet or other restrictions are indicated (that is, the risk of clinically significant aspiration or other complications outweighs the benefits of an unaltered or minimally altered diet), nursing will obtain an order for such restrictions from the physician.
 - a. Decisions to modify or restrict food and fluid intake should be based on weighing all of these relevant factors, including identified causes and resident/patient goals and wishes, and not just on a test result or a symptom.
 - b. The physician and staff will coordinate documentation in the medical record to identify the rationale for any restrictions, including review of possible causes and the feasibility of various measures to address the situation.
 - (1) Examples of situations in which speech therapy interventions may be helpful include individuals who have had a recent stroke with subsequent impaired chewing and swallowing; or individuals with neuromuscular disorders where compensatory techniques may allow the individual to eat more freely and reduce the risk of aspiration.
 - (2) There is not a simple and obvious relationship between prandial liquid aspiration and pneumonia. Some individuals have complications from aspiration, while others have "subclinical" (asymptomatic) or occasional aspiration that does not require significant diet modification or other interventions. Aspiration does not necessarily cause pneumonia, and many people who occasionally aspirate can eat and drink without complications.

continues on next page

6. The staff and physician will identify and address any complications of swallowing disorders and their underlying causes.
7. Generally, tube feeding is not recommended unless the above steps have been followed and other pertinent interventions are not feasible or have failed to prevent complications of clinically significant aspiration.
 - a. Percutaneous gastrostomy tubes may be beneficial for short-term use in select situations (for example, individuals with dysphagia due to a new stroke), but are unlikely to benefit others (for example, individuals with advanced dementia or other end-stage or terminal conditions).
 - b. In conjunction with the resident/patient and family, the physician must carefully consider the clinical and ethical appropriateness of any recommendations that the resident/patient should not be allowed to eat at all or should be tube fed because of aspiration risk.

Monitoring and Follow-Up

1. The staff and physician will monitor the progress of individuals with swallowing difficulties; for example, ease of eating, improvement of symptoms, and resolution of underlying causes.
2. For individuals who have been placed on modified consistency diets, the staff will monitor and report to the physician objective evidence of the resident/patient's progress in eating and drinking and tolerance of any restrictions, and will look for complications of such restrictions such as weight loss and an overall decline. The staff and physician will identify individuals whose swallowing capabilities decline, fluctuate, or result in clinically significant complications and will adjust diet and food consistency where relevant and make other appropriate interventions.
3. The staff and physician will identify individuals whose food and fluid restrictions can be upgraded; for example, from thickened to thin liquids or pureed to mechanical soft.

Osteoporosis – Clinical Protocol

Assessment and Recognition

1. The physician will help identify individuals with a history of osteopenia (moderate bone loss) or osteoporosis (more severe bone loss) and those with complications of osteoporosis; for example, osteoporosis confirmed by DEXA scan, kyphosis, a history of fractures with minimal or no trauma, a loss of height associated with back pain (indicating vertebral compression), or a loss of height relative to the individual's height at age 30.
2. The physician will identify individuals who are at risk for additional bone loss and distinguish non-modifiable (for example, female, small body frame, Caucasian or Asian race, etc.) from possibly modifiable factors (for example, smoking and inactivity) that may adversely affect bone metabolism.
3. The staff and physician will assess residents with identified osteoporosis or obvious skeletal deformity to determine functional capabilities, disabilities, and complications including pain and fall risk.

Cause Identification

1. The physician will confirm the diagnosis of osteoporosis based primarily on clinical findings such as evidence of compression fractures, previous fracture, loss of height as a result of kyphosis or exaggerated cervical lordosis, and on laboratory values and diagnostic test results where available and pertinent; for example, x-ray evidence of bone loss and results of a DEXA scan.
2. As appropriate, the physician will seek potentially modifiable causes of the individual's bone loss; for example, primary hyperparathyroidism, chronic corticosteroid usage, osteomalacia, renal failure, hyperthyroidism, immobility, and inadequate intake of calcium and vitamin D.

Treatment/Management

1. The physician and staff will identify pertinent medical interventions for individuals with osteoporosis or those with significant risk for osteoporosis.
2. The staff will institute basic measures, including strategies to try to maintain adequate supplementation, maximize mobility, and address modifiable risk factors.
 - a. Relevant measures may include fall prevention strategies (including gait and balance training), range of motion exercises in non-ambulatory residents, and regular weight-bearing exercise.
3. The physician will review current medications and try to reduce, discontinue, or substitute for medications that predispose residents to osteoporosis (for example, anticonvulsants and glucocorticoids) or increase the risk of falling (see policy on Managing Falls and Fall Risk).
4. The physician will order calcium and vitamin D supplementation as appropriate and if not contraindicated.
 - a. Calcium and vitamin D supplementation may slow additional bone loss. Total daily amounts (including dietary intake) should approximate 1200-1500 mg/day of calcium and 800-1000 international units/day of vitamin D, unless otherwise indicated.
5. The physician will evaluate whether the resident is a candidate for taking bisphosphonates, calcitonin, or other medications for treating osteoporosis based on severity of bone loss, ability to tolerate and take the medications appropriately, presence of relative contraindications, overall prognosis, and other factors.

continues on next page

6. The physician and staff will identify and institute treatments for complications of osteoporosis such as pain and impaired mobility.
7. The physician will consider whether the resident with complications from vertebral compression fractures might benefit from palliative surgical interventions such as vertebroplasty or kyphoplasty.

Monitoring

1. The staff and physician will periodically assess and document the individual's progress in maintaining or improving bone integrity.
 - a. If feasible and pertinent, the situation should be re-evaluated approximately every 3 to 6 months; for example, objective pain assessment, evaluation of ADL function and dependency, strength, and mobility.
2. The staff and physician will monitor the individual for side effects of treatments for osteoporosis; for example, heartburn or esophagitis in someone taking a bisphosphonate, or nasal irritation from calcitonin.
 - a. The physician should identify alternatives for someone who can benefit from treatment but who is experiencing significant side effects from a current osteoporosis-related medication regimen.

Hydration – Clinical Protocol

Assessment and Recognition

1. The physician and staff will help define the individual's current hydration status (fluid and electrolyte balance or imbalances).
 - a. The physician will distinguish various types of fluid and electrolyte imbalance (for example, hyponatremia, hypernatremia, pre-renal azotemia, etc.) from true dehydration (clinically significant loss of total body water).
2. The staff, with the physician's input, will identify and report to the physician individuals with signs and symptoms (for example, delirium, lethargy, increased thirst, etc.) or lab test results (for example, hypernatremia, azotemia, etc.) that might reflect existing fluid and electrolyte imbalance.
3. The physician and staff will identify significant risk for subsequent fluid and electrolyte imbalance; for example, individuals with prolonged vomiting, diarrhea, or fever, or who are taking diuretics and/or ACE inhibitors and who are not eating or drinking well.

Cause Identification

1. The physician will help identify the cause(s) of any existing fluid and electrolyte imbalance or help the staff document why the individual should not be tested or evaluated.
 - a. A limited review for causes (for example, based on the clinical situation and a basic metabolic profile [BMP]) may be appropriate even if an extensive work-up is not.

Treatment/Management

1. The physician will manage significant fluid and electrolyte imbalance, and associated risks, appropriately and in a timely manner.
 - a. Timeliness depends on the severity, nature, and causes of the fluid and electrolyte imbalance.
 - b. For minor, uncomplicated fluid and electrolyte imbalance, oral rehydration may suffice. For more severe or complicated fluid and electrolyte imbalance, subcutaneous (hypodermoclysis) or intravenous hydration may be needed.
 - c. Any medications that are contributing to fluid and electrolyte imbalance should be tapered or stopped (at least temporarily), or the physician should provide clinically valid documentation as to why they cannot or should not be changed, even temporarily.
2. The staff will provide supportive measures such as supplemental fluids and adjusting environmental temperature, where indicated.

continues on next page

Monitoring and Follow-Up

1. The physician and staff will monitor for the subsequent development, progression, or resolution of fluid and electrolyte imbalance in at-risk individuals.
 - a. For example, replacement may be adequate if the resident is clinically stable, not having delirium, voiding at least every 3-4 hours, and the urine specific gravity (where attainable) is less than 1.015.
2. The physician will adjust treatments based on specific information (lab results, level of consciousness, etc.) relevant to that individual.
 - a. Oral replacement may be adequate if the patient is clinically stable, not having delirium, voiding at least every 3-4 hours, and the urine specific gravity (where attainable) is less than 1.015.
 - b. Repeating the basic metabolic profile and/or serum osmolality can help track progress in correcting abnormalities.

Version	1.3 (H5MACL0023)

Nutrition (Impaired)/Unplanned Weight Loss – Clinical Protocol

Assessment and Recognition

1. The nursing staff will monitor and document the weight and dietary intake of residents in a format which permits comparisons over time.
2. The staff and physician will define the individual's current nutritional status (weight, food/fluid intake, and pertinent laboratory values) and identify individuals with anorexia, weight loss or gain, and significant risk for impaired nutrition; for example, high risk residents with acute symptoms such as vomiting, diarrhea, fever and infection, or those taking medications that may be causing weight gain or increasing the risk of anorexia or weight loss.
3. The physician will consider whether any assessment including additional diagnostic testing is indicated to help clarify the severity or consequences of weight loss and/or impaired nutrition.
 - a. No lab tests are sensitive or specific enough for defining nutritional status that they should be ordered for everyone. Lab tests should be ordered if they are likely to substantially help establish current status or prognosis, causes or choices of interventions; otherwise, routine ordering to assess or follow nutritional status is not generally indicated.
4. The staff will report to the physician significant weight gains or losses or any abrupt or persistent change from baseline appetite or food intake.

Cause Identification

1. The physician will review for medical causes of weight gain, anorexia and weight loss before ordering interventions.
2. For individuals with recent or rapid weight gain or loss (for example, more than a pound a day), the staff and will review for possible fluid and electrolyte imbalance as a cause.
 - a. Conditions such as heart failure and renal failure can cause rapid weight gain and fluid deficits can result in rapid weight loss (1 kg/2.2 pounds gained or lost for each liter of fluid excess or deficit). The physician, with the help of the multidisciplinary team, will identify conditions and medications that may be causing anorexia, weight loss or increasing the risk of weight loss.
3. The physician will help identify medical conditions (cancer, cardiac or renal disease, depression, dental problems, etc.) and medications that may be causing weight gain or loss or increasing risk for either gaining or losing weight.
 - a. Many categories of diseases and medications can affect appetite directly or indirectly by affecting taste or causing lethargy, confusion, dry mouth, etc.
4. The physician will review carefully, and rule out medical causes of, oral or swallowing problems before authorizing other consults or interventions to modify diet consistency.
 - a. Sometimes, an extensive workup may not be appropriate or knowing the cause may not change the interventions. Nevertheless, a systematic review for causes based on an individual's history, comorbidities, risk factors, etc. may be appropriate even if an extensive workup is not.

continues on next page

5. The physician will review and rule out medical causes of oral or swallowing problems before authorizing other consults or interventions to modify diet consistency.
 - a. A physician should define and differentiate basic causes of apparent swallowing or choking problems; other disciplines may be trained to treat symptoms but not to identify a differential diagnosis.
6. The physician (or staff, based on a discussion with the physician) will document relevant medical information regarding the nature, severity, causes, and consequences of impaired nutritional status, especially in complex situations such as where multiple causes coexist.

Treatment/Management

1. The staff and physician will identify pertinent interventions based on identified causes and overall resident condition, prognosis, and wishes.
 - a. Treatment decisions should consider all pertinent evidence and relevant issues (e.g., food intake, resident / patient wishes, overall condition and prognosis, etc.), and should not be based solely on lab or diagnostic test results (albumin, cholesterol, swallowing studies, etc.).
2. The physician will authorize appropriate interventions, as indicated.
 - a. This may include tapering, stopping, or switching medications known to be associated with undesirable weight gain or anorexia or weight loss.
 - b. The physician will document if cause-specific interventions could not be identified or are not feasible.
3. The staff and physician will review and consider existing dietary restrictions and modified consistency diets.
 - a. Dietary restrictions are not always essential, and they may even be unnecessary or harmful. In some instances, the risk of continued weight loss and hydration deficits may outweigh other considerations that such restrictions are meant to address.
4. The physician will limit prescribing of “appetite stimulants” to situations in which underlying causes cannot be identified or treated, other pertinent interventions have not worked or are not feasible, these medications have a valid indication, and improving appetite and weight is consistent with the individual’s condition, prognosis, and wishes.
 - a. A pertinent assessment and meaningful review of possible medical and non-medical causes of altered nutritional status should precede the use of such medications.

Monitoring

1. The physician and staff will monitor nutritional status, an individual’s response to interventions, and possible complications of such interventions (for example, additional weight gain or loss, nausea, or vomiting).
2. When medical conditions or medication-related adverse consequences are causing or contributing to altered nutritional status, the physician and staff will collaborate in adjusting interventions, taking into account the status of those causes and the resident/patient’s responses, goals, wishes, prognosis, and complications.

continues on next page

3. The physician and staff will collaborate to address any ethical issues related to weight and nutrition (for example, possible use of artificial nutrition and hydration) related to severe or prolonged impairment of nutritional status and weight loss.
 - a. Such recommendations should be consistent with resident/patient treatment wishes; for example, as expressed through an advance directive.
 - b. The physician and staff should ordinarily not recommend or order a feeding tube until seeking to identify causes and trying other alternatives or identifying them as legitimately not feasible.
 - c. The physician and staff will document the medical and ethical rationale for recommending, not recommending, or discontinuing tube feedings, consistent with the clinical situation and applicable laws and regulations about the withholding or withdrawing of artificial nutrition and hydration.

Enteral Nutrition

Policy Statement

Adequate nutritional support through enteral nutrition is provided to residents as ordered.

Policy Interpretation and Implementation

1. The interdisciplinary team, including the dietitian, conducts a full nutritional assessment within current initial assessment timeframes to determine the clinical necessity of enteral feedings. The assessment includes:
 - a. evaluation of the resident's current clinical and nutritional status;
 - b. relevant functional and psychosocial factors; and
 - c. a review of interventions to maintain oral intake prior to the use of a feeding tube and the resident's response to them.
2. The recommendation to initiate the use of enteral nutrition is based on the results of the comprehensive nutritional assessment, and is consistent with current standards of practice, the resident's advance directives, treatment goals and facility policies.
3. The dietitian, with input from the provider and nurse:
 - a. estimates calorie, protein, nutrient and fluid needs;
 - b. determines whether the resident's current intake is adequate to meet his or her nutritional needs;
 - c. recommends special food formulations; and
 - d. calculates fluids to be provided (beyond free fluids in formula).
4. Enteral nutrition is ordered by the provider based on the recommendations of the dietitian. If a feeding tube is ordered, the provider and interdisciplinary team document why enteral nutrition is medically necessary.
5. Some examples of potential benefits of using a feeding tube include:
 - a. addressing malnutrition and dehydration;
 - b. promoting wound healing; and/or
 - c. allowing a resident to gain strength that may allow him or her to return to oral nutrition.
6. If the resident has a feeding tube placed prior to admission or returning to the facility, the provider and the interdisciplinary team will review the rationale for the placement of the feeding tube, the resident's current clinical and nutritional status, and the treatment goals and wishes of the resident.
7. The decision to continue or discontinue the use of the feeding tube is made through collaboration between the interdisciplinary team, the provider and the resident.
8. The dietitian monitors residents who are receiving enteral nutrition, and makes appropriate recommendations for interventions to enhance tolerance and nutritional adequacy of enteral feedings.
9. The nursing staff and provider monitor the resident for signs and symptoms of inadequate nutrition, altered hydration, hypo- or hyperglycemia, and altered electrolytes. The nursing staff and provider also monitor the resident for worsening of conditions that place the resident at risk for the above.
10. Enteral feedings are scheduled to try to optimize resident independence whenever possible (e.g., at night or during hours that do not interfere with the resident's ability to participate in facility activities).

continues on next page

11. The nurse confirms that orders for enteral nutrition are complete. Complete orders include:
 - a. the enteral nutrition product;
 - b. delivery site (tip placement);
 - c. the specific enteral access device (nasogastric, gastric, jejunostomy tube, etc.);
 - d. administration method (continuous, bolus, intermittent);
 - e. volume and rate of administration;
 - f. the volume/rate goals and recommendations for advancement toward these; and
 - g. instructions for flushing (solution, volume, frequency, timing and 24-hour volume).
12. The provider will consider the need for supplemental orders, including:
 - a. confirmation of tube placement;
 - b. laboratory monitoring;
 - c. instructions for EN preparation;
 - d. nutritional consultation;
 - e. head of bed elevation;
 - f. oral care; and
 - g. checks for gastric residual volume (GRV).
13. Staff caring for residents with feeding tubes are trained on potential adverse effects of tube feeding, such as:
 - a. reduced opportunity for socialization;
 - b. diminished sensory experience; and
 - c. restriction of movement.
14. Staff caring for residents with feeding tubes are trained on how to recognize and report complications associated with the insertion and/or use of a feeding tube, such as:
 - a. aspiration;
 - b. tube misplacement or migration;
 - c. skin breakdown around insertion site;
 - d. perforation of the stomach or small intestine leading to peritonitis;
 - e. esophageal swelling, strictures, fistulas; and
 - f. clogging of the tube.
15. Staff caring for residents with feeding tubes are trained on how to recognize and report complications relating to the administration of enteral nutrition products, such as:
 - a. nausea, vomiting, diarrhea and abdominal cramping;
 - b. inadequate nutrition;
 - c. metabolic abnormalities;
 - d. interactions between feeding formula and medications; and
 - e. aspiration.
16. Risk of aspiration is assessed by the nurse and provider and addressed in the individual care plan. Risk of aspiration may be affected by:
 - a. diminished level of consciousness;
 - b. moderate to severe swallowing difficulties;
 - c. improper positioning of the resident during feeding; and
 - d. failure to confirm placement of the feeding tube prior to initiating the feeding.

continues on next page

17. Residents receiving enteral nutrition are periodically reassessed for the continued appropriateness and necessity of the feeding tube. Results of these assessments are documented and any changes are made to the care plan. Input from the resident or legal representative is included in the assessment.
18. Central supply is responsible for ordering all tube feeding supplies. The staff may use products from a basic formulary until any specialized products can be delivered.

Nutritional Assessment

Policy Statement

As part of the comprehensive assessment, a nutritional assessment, including current nutritional status and risk factors for impaired nutrition, shall be conducted for each resident.

Policy Interpretation and Implementation

1. The dietitian, in conjunction with the nursing staff and healthcare practitioners, will conduct a nutritional assessment for each resident upon admission (within current baseline assessment timeframes) and as indicated by a change in condition that places the resident at risk for impaired nutrition.
2. As part of the comprehensive assessment, the nutritional assessment will be a systematic, multidisciplinary process that includes gathering and interpreting data and using that data to help define meaningful interventions for the resident at risk for or with impaired nutrition.
3. The nutritional assessment will be conducted by the multidisciplinary team and shall identify at least the following components:
 - a. Nursing:
 - (1) Usual body weight;
 - (2) Current height and weight;
 - (3) A description of the resident's usual intake and appetite;
 - (4) A history of reduced appetite or progressive weight loss or gain prior to admission;
 - (5) Current clinical conditions and recent events that may have affected a resident's nutritional status and risk factors;
 - (6) Advance directives that may influence decision-making regarding nutrition support;
 - (7) General appearance – a description of the resident's overall appearance;
 - (8) The resident's usual route(s) of intake (e.g., oral, enteral, parenteral);
 - (9) Usual meal and snack patterns;
 - (10) Food preferences and dislikes (including flavors, textures, and forms);
 - (11) Food restrictions, including food allergies and cultural or religious practices affecting food choices; and
 - (12) Preferred portion sizes.
 - b. Consultant Pharmacist:
 - (1) Current medication regimen, including a list of medications that affect nutrient absorption, appetite, level of consciousness, and/or gastrointestinal function.
 - c. Physicians and Practitioners:
 - (1) Current clinical conditions and recent events that may have affected a resident's nutritional status and risk factors;
 - (2) Current laboratory results related to fluid and electrolyte status (BUN, creatinine, serum osmolality); and
 - (3) The presence of chewing or swallowing abnormalities, i.e., conditions of the mouth, teeth, gums pharynx or esophagus that affect the resident's ability to chew or swallow food.

continues on next page

- d. Dietitian:
 - (1) An estimate of calorie, protein, nutrient and fluid needs;
 - (2) Whether the resident's current intake is adequate to meet his or her nutritional needs; and
 - (3) Special food formulations.
4. The multidisciplinary team shall identify, upon the resident's admission and upon his or her change of condition, the following situations that place the resident at increased risk for impaired nutrition (Note: Many residents have multiple, co-existing risk factors.):
 - a. **Cognitive or functional decline** – includes anything that impairs the resident's ability to eat the meals that are provided (for example, decreased mental alertness, poor motor coordination or decreased range of motion).
 - b. **Chewing or swallowing abnormalities** – onset or exacerbation of conditions of the mouth, teeth, gums pharynx or esophagus that affect the resident's ability to chew or swallow food.
 - c. **Pain** – the presence of clinical conditions or situations in which a resident's level of pain interferes with his or her ability to chew, swallow or otherwise consume the meals as provided.
 - d. **Medication changes** – includes changes resulting in loss of appetite, nausea, constipation, lethargy, decreased absorption, swallowing difficulty, etc.
 - e. **Environmental factors** – environmental changes that affect the resident's intake or appetite during mealtimes (for example, noise or room temperature).
 - f. **Increased need for calories and/or protein** – onset or exacerbation of diseases or conditions that result in a hypermetabolic state and an increased demand for calories and protein (e.g., cancer, COPD, liver disease; hyperthyroidism, wounds).
 - g. **Poor digestion or absorption** – onset or exacerbation of conditions that affect digestion and absorption of nutrients (pancreatitis, gastritis, motility disorders).
 - h. **Fluid and nutrient loss** – prolonged fluid and nutrient losses secondary to diarrhea and/or vomiting that may increase nutritional requirements.
 - i. **Inadequate availability of food or fluids** – lack of access to the amount of food or fluids that the resident requires to maintain sufficient nutrition and hydration.
5. For residents who are receiving enteral nutrition support, the nutritional assessment shall include gathering information and documenting why the enteral nutrition is medically necessary.
6. Sources of information for the resident nutritional assessment may include the following:
 - a. Standardized nutrition screening and assessment tools;
 - b. Resident Assessment Instrument (RAI);
 - c. Assessments from other disciplines;
 - d. Observation;
 - e. Resident and family interviews; and
 - f. The resident's current medical record.
7. Once current conditions and risk factors for impaired nutrition are assessed and analyzed, individual care plans will be developed that address or minimize to the extent possible the resident's risks for nutritional complications. Such interventions will be developed within the context of the resident's prognosis and personal preferences.
8. Individualized care plans shall address, to the extent possible:
 - a. the identified causes of impaired nutrition;
 - b. the resident's personal preferences;
 - c. goals and benchmarks for improvement; and
 - d. time frames and parameters for monitoring and reassessment.

continues on next page

9. If the need for enteral or parenteral nutrition is determined by the IDT, the nutrition care plan shall indicate the route of administration and the resident’s requirements for nutrient intake.
 - a. Nutrition therapy will be consistent with the resident’s stated wishes and goals as indicated in the advance directive.
 - b. When selecting the route of nutrition therapy, the least invasive and most efficacious therapy will be selected.
 - c. Whenever possible, oral diet with supplementation will be used to administer nutrition therapy.
 - d. The gastrointestinal tract is the preferred route for nutrition support.
 - e. The need for enteral or parenteral nutrition shall be periodically reassessed for appropriateness and effectiveness (at least quarterly for enteral nutrition and monthly for parenteral nutrition).

Resident Hydration and Prevention of Dehydration

Policy Statement

This facility will strive to provide adequate hydration and to prevent and treat dehydration.

Policy Interpretation and Implementation

1. The dietitian will assess all residents for hydration as part of the comprehensive assessment, at least quarterly, and more often as necessary per resident need.
2. Minimum fluid needs will be calculated and documented on initial, annual, and significant change assessments, using current standards of practice.
3. Physician orders to limit fluids will take priority over calculated fluid needs. The dietitian may refer calculated needs to the physician if restrictions potentially increase risk for dehydration.
4. The dietitian and nursing staff will educate the resident and family regarding hydration and preventing dehydration.
5. Nurses will assess for signs and symptoms of dehydration during daily care.
6. Nurses' aides will provide and encourage intake of bedside, snack and meal fluids, on a daily and routine basis as part of daily care.
 - a. Intake will be documented in the medical records.
 - b. Aides will report intake of less than 1200ml/day to nursing staff.
7. If potential inadequate intake and/or signs and symptoms of dehydration are observed, intake and output monitoring will be initiated and incorporated into the care plan.
 - a. ADL status, diagnosis, individual preferences, habits, and cognitive and medical status will be considered in all interventions.
 - b. The physician will be notified.
8. Orders may be written for extra fluids to be encouraged between meals and/or with medication passes.
 - a. A specific minimum amount should be included in the order (e.g. 240ml fluids BID with medication pass).
 - b. "Force fluids" is not an appropriate order. "Encourage fluids" is not an adequate order.
9. The dietitian, nursing staff, and the physician will assess factors that may be contributing to inadequate fluid intake. Orders for medications that may exacerbate dehydration (e.g., diuretics) will be reviewed and held if medically appropriate.
10. Laboratory tests may be ordered to assess hydration if intake and symptoms indicate possible significant dehydration.
11. If laboratory results are consistent with actual dehydration, the physician may initiate IV hydration. Hospitalization will be recommended, as necessary.
12. Nursing will monitor and document fluid intake and the dietitian will be kept informed of status. The interdisciplinary team will update the care plan and document resident response to interventions until the team agrees that fluid intake and relating factors are resolved.

Therapeutic Diets

Policy Statement

Therapeutic diets are prescribed by the attending physician to support the resident's treatment and plan of care and in accordance with his or her goals and preferences.

Policy Interpretation and Implementation

1. Diet will be determined in accordance with the resident's informed choices, preferences, treatment goals and wishes. Diagnosis alone will not determine whether the resident is prescribed a therapeutic diet.
2. A therapeutic diet must be prescribed by the resident's attending physician (or non-physician provider). The attending physician may delegate this task to a registered or licensed dietitian as permitted by state law.
3. Diet order should match the terminology used by the food and nutrition services department.
4. A "therapeutic diet" is considered a diet ordered by a physician, practitioner or dietitian as part of treatment for a disease or clinical condition, to modify specific nutrients in the diet, or to alter the texture of a diet, for example:
 - a. diabetic/calorie controlled diet;
 - b. low sodium diet;
 - c. cardiac diet; and
 - d. altered consistency diet.
5. If a "mechanically altered diet" is ordered, the provider will specify the texture modification.
6. The resident has the right not to comply with therapeutic diets.
7. The dietitian, nursing staff, and attending physician will regularly review the need for, and resident acceptance of, prescribed therapeutic diets.
8. The dietitian and nursing staff will document significant information relating to the resident's response to his/her therapeutic diet in the resident's medical record.
9. Snacks will be compatible with the therapeutic diet.
10. As appropriate, the attending physician may temporarily suspend a therapeutic diet for special occasions.
11. The attending physician may liberalize the diet at the request of the IDT (if the resident is losing weight or not eating well) or the resident.
12. If the resident or the resident's representative declines the recommended therapeutic diet, the interdisciplinary team will collaborate with the resident or representative to identify possible alternatives.

Weight Assessment and Intervention

Policy Statement

The multidisciplinary team will strive to prevent, monitor, and intervene for undesirable weight loss for our residents.

Policy Interpretation and Implementation

Weight Assessment

1. The nursing staff will measure resident weights on admission, the next day, and weekly for two weeks thereafter. If no weight concerns are noted at this point, weights will be measured monthly thereafter.
2. Weights will be recorded in each unit's weight record chart or notebook and in the individual's medical record.
3. Any weight change of 5% or more since the last weight assessment will be retaken the next day for confirmation. If the weight is verified, nursing will immediately notify the dietitian in writing. Verbal notification must be confirmed in writing.
4. The dietitian will respond within 24 hours of receipt of written notification.
5. The dietitian will review the unit weight record by the 15th of the month to follow individual weight trends over time. Negative trends will be evaluated by the treatment team whether or not the criteria for "significant" weight change has been met.
6. The threshold for significant unplanned and undesired weight loss will be based on the following criteria [where *percentage of body weight loss* = $(usual\ weight - actual\ weight) / (usual\ weight) \times 100$]:
 - a. 1 month – 5% weight loss is significant; greater than 5% is severe.
 - b. 3 months – 7.5% weight loss is significant; greater than 7.5% is severe.
 - c. 6 months – 10% weight loss is significant; greater than 10% is severe.
7. If the weight change is desirable, this will be documented and no change in the care plan will be necessary.

Analysis

1. Assessment information shall be analyzed by the multidisciplinary team and conclusions shall be made regarding:
 - a. the resident's target weight range (including rationale if different from ideal body weight);
 - b. the approximate calorie, protein, and other nutrient needs compared with the resident's current intake;
 - c. the relationship between current medical condition or clinical situation and recent fluctuations in weight; and
 - d. whether and to what extent weight stabilization or improvement can be anticipated.
2. The physician and the multidisciplinary team will identify conditions and medications that may be causing anorexia, weight loss or increasing the risk of weight loss. For example:
 - a. cognitive or functional decline;
 - b. chewing or swallowing abnormalities;
 - c. pain;

continues on next page

- d. medication-related adverse consequences;
- e. environmental factors (such as noise or distractions related to dining);
- f. increased need for calories and/or protein;
- g. poor digestion or absorption;
- h. fluid and nutrient loss; and/or
- i. inadequate availability of food or fluids.

Care Planning

1. Care planning for weight loss or impaired nutrition will be a multidisciplinary effort and will include the physician, nursing staff, the dietitian, the consultant pharmacist, and the resident or resident's legal surrogate.
2. Individualized care plans shall address, to the extent possible:
 - a. the identified causes of weight loss;
 - b. goals and benchmarks for improvement; and
 - c. time frames and parameters for monitoring and reassessment.

Interventions

1. Interventions for undesirable weight loss shall be based on careful consideration of the following:
 - a. Resident choice and preferences;
 - b. Nutrition and hydration needs of the resident;
 - c. Functional factors that may inhibit independent eating;
 - d. Environmental factors that may inhibit appetite or desire to participate in meals;
 - e. Chewing and swallowing abnormalities and the need for diet modifications;
 - f. Medications that may interfere with appetite, chewing, swallowing, or digestion;
 - g. The use of supplementation and/or feeding tubes; and
 - h. End of life decisions and advance directives.
2. The dietitian will discuss undesired weight gain with the resident and/or family.
3. Interventions for undesired weight gain should consider resident preferences and rights. A weight loss regimen should not be initiated for a cognitively capable resident without his/her approval and involvement.
4. If a resident declines to participate in a weight loss goal, the dietitian will document the resident's wishes, and those wishes will be respected.

Encouraging and Restricting Fluids

Level II

Purpose

The purpose of this procedure is to provide the resident with the amount of fluids necessary to maintain optimum health. This may include encouraging or restricting fluids.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan and/or your daily assignment sheet to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Follow specific instructions concerning fluid intake or restrictions.
2. Be accurate when recording fluid intake.
3. Record fluid intake on the intake side of the intake and output record. Record fluid intake in mLs.
4. Be supportive of the resident's fluid intake. Encourage the resident to follow specific instructions.
5. Encourage the resident's family and visitors to stay within the limits of his or her intake.
6. Substitute other liquids (i.e., tea, broth, soda, gelatin, milk, ice cream, etc.) as permitted by the resident's diet.
7. When a resident has been placed on restricted fluids, remove the water pitcher and cup from the room. If the resident refuses to have the water pitcher removed, notify the supervisor and in turn, the physician.
8. Be sure an intake and output record is maintained in the resident's room.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Intake and output record;
2. Pen or pencil; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

Encouraging Fluids:

1. Wash and dry your hands thoroughly before serving the resident fluids.
2. Take the fluid container to the resident's room.
3. Inform the resident you have brought him or her a drink. Tell the resident what type of drink it is.
4. Encourage the resident to drink the fluid. Should the resident refuse, report such information to your supervisor.
5. Record the amount of fluid consumed on the intake side of the intake and output record. Record fluid intake in mLs.

continues on next page

6. Provide mouth care as necessary.
7. Remove fluid container.
8. Wash and dry your hands thoroughly.

Restricting Fluids:

1. Remove the resident's water pitcher and cup from the room. Store in designated area. If the resident refuses to have the water pitcher removed, notify the supervisor and in turn, the physician.
2. Wash and dry your hands thoroughly before serving the resident fluids.
3. Take the fluid container to the resident's room.
4. Inform the resident you have brought him or her a drink. Tell the resident what type of drink it is.
5. Encourage the resident to drink the fluid. Should the resident refuse, report such information to your supervisor.
6. Record the amount of fluid consumed on the intake side of the intake and output record. Record fluid intake in mLs.
7. Provide mouth care as necessary.
8. Remove fluid container.
9. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual who performed the procedure.
3. Any changes in the resident's condition.
4. Any problems or complaints made by the resident related to the procedure.
5. Any evidence of dehydration such as weight loss, confusion, drowsiness, dry skin, etc.
6. The amount (in mLs) of fluids consumed by the resident during the shift.
7. The type of liquid consumed (i.e., tea, milk, coffee, soup, etc.).
8. If the resident refused the treatment, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Hypodermoclysis – Subcutaneous Hydration

Level III

Purpose

The purpose of this procedure is to provide guidelines for administration of subcutaneous hydration to the resident as ordered.

General Guidelines

1. Verify with state Nurse Practice Act as to RN/LPN scope of practice regarding this procedure.
2. Hypodermoclysis is a method of hydration that does not require an intravenous catheter for delivery.
3. Hypodermoclysis involves using small needles to deliver isotonic fluids (0.9 NS, lactated ringers, D5W) slowly into the subcutaneous tissue.
4. This system is designed for short-term, preventative hydration or for mild dehydration.
5. Hypodermoclysis is NOT for antibiotics, narcotics, or fluids with electrolytes (KCL, magnesium, etc.).
6. Sites for needle placement are the abdomen, stomach, and front or side of thighs. Less commonly used sites are the upper arms or upper back shoulder area.
7. The fluid is infused into the subcutaneous tissue where it is absorbed slowly. While the fluid is absorbed, a *fluid wheal* will form. This is normal and is not an infiltration of fluids.
8. Hypodermoclysis reduces the chance of the following complications associated with intravenous therapy:
 - a. Fluid overload, CHF;
 - b. Phlebitis; and
 - c. Infections.
9. Physician order should include:
 - a. Type and quantity of isotonic fluid;
 - b. Rate (determined by type of delivery set); and
 - c. Length of treatment.

Equipment and Supplies

1. Hypodermoclysis set with needle strip;
2. Isotonic solution bag;
3. Antiseptic skin cleaning solution;
4. Non-sterile gloves;
5. Transparent dressing; and
6. IV pole.

Steps in the Procedure

1. Review physician order.
2. Explain procedure to resident.
3. Assemble fluid and kit.
4. Wash hands. Don non-sterile gloves.
5. Prime tubing including attached needle set until all air is removed.
6. Do sterile site preparation and allow to air dry.
7. Pinch up skin or flatten skin. Insert needle strip flat into skin.

continues on next page

8. Secure needle strip to skin using transparent dressing. Tape tubing to skin.
9. Date dressing and tubing.
10. Start fluid and adjust flow rate. Make sure that resident is comfortable.
11. Monitor for fluid wheal formation. This is affected by metabolism rate of resident.
12. If necessary, the site may be lightly massaged to help fluid absorption.
13. Observe for any signs of peripheral edema (not the fluid wheal), leakage or fluid overload. Monitor for line disconnection from skin.
14. If the site needs to be changed, the whole set including needles are changed as one piece. Contact pharmacy for new set. No new order is needed.

Documentation

1. Document the following in the resident's medical record upon insertion:
 - a. Procedure;
 - b. Type of fluids; and
 - c. Dressing and tubing.
2. Document the change date on the medication administration record.
3. Document the following in the resident's medical record every shift:
 - a. The type of fluid being infused, location of needle placement, type of antiseptic used to clean skin;
 - b. Intake and output totals;
 - c. Time fluid bag was started and discontinued;
 - d. Condition of skin where needles are inserted, any leakage, peripheral edema (not fluid wheal), statement from resident regarding how they are tolerating the treatment;
 - e. Date and time of tubing and needle strip site change and reason for changing site (leakage, skin irritation, 72 hour site change); and
 - f. Any communication with physician about problems, laboratory values.

Reporting

1. Report to physician or supervisor any information about treatment.
2. Report to oncoming shift nurses the type of treatment, needle insertion site, any complications, and any objective information concerning treatment.

Version	1.1 (H5MAPR0324)

Intake, Measuring and Recording

Level II

Purpose

The purpose of this procedure is to accurately determine the amount of liquid a resident consumes in a 24-hour period.

Preparation

1. Verify that there is a physician's order for this procedure and/or that the procedure is being performed per facility policy.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Inform the resident and his or her family and visitors that the resident is on **intake** and **output**.
2. If the resident is medically capable of understanding the procedure, ask him or her to assist you in telling you when he or she drank some fluid and how much he or she drank.
3. Fluids taken intravenously are recorded by the licensed nurse.
4. Record the fluid intake as soon as possible after the resident has consumed the fluids.
5. At the end of your shift, total the amounts of all liquids the resident consumed.
6. Record all fluid intake on the intake and output record in cubic centimeters (mLs).
7. Post an intake and output record form in the resident's room.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Measuring container;
2. Intake and output record;
3. Pen or pencil; and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Be sure that the intake and output record is available.
4. Pour the leftover fluid from the serving container into the measuring container.
5. Place the measuring container on a flat surface (i.e., bedside stand, overbed table, etc.).
6. Carefully look at the level of fluid. Maintain eye level so that you can see the number reached by the level of the fluid.

continues on next page

7. Subtract the amount in the measuring container from the amount in the serving container. This is the amount consumed. Example:

Resident served 8 oz. glass of water	8 oz. = 240 mLs
Leftover fluid 3 oz.	3 oz. = 90 mLs
Total liquid resident consumed	5 oz. = 150 mLs

Alternately, the resident on intake, with his/her permission, may receive fluids in specific containers designed for ease in measuring fluid intake.

8. Record the amount noted on the intake side of the intake and output record.
9. Record the time the intake was measured.
10. Pour unused fluids down the commode.
11. Discard disposable equipment and supplies in designated containers.
12. Clean the bedside stand or overbed table and return it to its proper position.
13. Wash, rinse, and return the graduate to its designated storage area.
14. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record, per facility guidelines:

1. The date and time the resident's fluid intake was measured and recorded.
2. The name and title of the individual who measured and recorded the resident's fluid intake.
3. The amount (in mLs) of liquid consumed.
4. The type of liquid consumed (i.e., tea, milk, coffee, soup, etc.).
5. If the resident refused the treatment, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Intravenous Administration of Fluids and Electrolytes

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic administration of intravenous fluids and electrolytes for hydration.

Preparation

1. A physician's order is necessary to give intravenous fluids and electrolytes.
2. Review the resident's care plan and medical history for any special needs. These could include lung and heart related problems, agitation, allergies, and/or lab values.
3. Assess resident's lung and heart status and vital signs before and during therapy to assess for fluid overload.
4. Assemble equipment. Verify that infusion catheter is patent and has no complications.
5. The licensed nurse who is responsible for administering the fluids and electrolytes shall be knowledgeable of the following:
 - a. indications for use;
 - b. side effects;
 - c. toxicities;
 - d. incompatibilities;
 - e. stability;
 - f. storage requirements;
 - g. potential complications; and
 - h. appropriate rates and doses and routes of administration.

General Guidelines

1. First Dose of medication should be given in a situation in which close observation of the resident and the ability to intervene in the case of complications is possible. Obtain order for anaphylaxis protocol, or note if there is a standing protocol for intervention.
2. Resident should be monitored frequently, per facility policy, when continuous fluids are infusing. Monitor for signs and symptoms of fluid overload, catheter and insertion site complications, and the resident's tolerance of procedure. Fluids may be stopped by a nurse if signs of problem are present.
3. Refer to Intravenous Therapy policies and procedures for catheter insertion, care and maintenance.

Equipment and Supplies

1. Infusion solution;
2. Administration set;
3. Saline (preservative-free 0.9% sodium chloride) or heparin for flush, if appropriate;
4. Needleless access device/adaptor;
5. Electronic infusion pump or regulator tubing;
6. Gloves;

continues on next page

7. Alcohol swabs; and
8. Tape.

Assessment

1. Inspect intravenous catheter and insertion site for signs and symptoms of complications at scheduled intervals (per facility policy), during routine site care and when changing administration sets.
2. Prior to administration of intravenous fluids and electrolytes assess resident's:
 - a. overall health status;
 - b. cardiovascular and respiratory status;
 - c. history of allergies;
 - d. baseline vital signs, height and weight; and
 - e. laboratory results and appropriateness of therapy.
3. Review physician's order. Confirm type, volume of solution, route, and rate of administration.
4. Verify the identity of the resident.
5. Inspect solution for leaks, cracks, precipitate, and expiration date.

Steps in the Procedure

1. Perform hand antisepsis and apply non-sterile gloves.
2. Prime tubing of administration set.
3. Disinfect catheter access device with alcohol, rubbing back and forth around end of cap.
4. Flush catheter using normal saline per facility protocol.
5. Connect primed administration set to catheter injection/access device using needleless access device/adaptor.
6. Open roller clamp.
7. Establish prescribed rate of flow:
 - a. If infusing via gravity:
 - (1) check orders for amount to be infused and duration;
 - (2) calculate drops per minute; and
 - (3) adjust clamp to achieve desired flow rate.
 - b. If infusing via pump:
 - (1) check orders for amount to be infused and duration;
 - (2) follow manufacturer's directions to program pump; and
 - (3) program to achieve desired flow rate.
8. When infusion is complete:
 - a. For intermittent therapy:
 - (1) clamp tubing and disconnect from catheter;
 - (2) if tubing will be reused, replace sterile cap; and
 - (3) flush catheter per protocol.
 - b. For continuous therapy, mark solution container with label that states when bag was started and approximate time of completion. Always use a label or tape (never write directly on the bag with ink or marker).
9. Document procedure in the resident's medical record and on the intake/output record.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the infusion was administered.
2. The type of solution administered.
3. The amount of solution administered.
4. The route of administration.
5. The rate of administration.
6. The condition of the IV site before and after administration.
7. Notification of the physician if there are any complications.
8. Quote from resident stating how they tolerated the procedure.
9. The signature and title of the person recording the data.

Reporting

1. Notify physician, supervisor, and on coming shift of complications or resident refusal of treatment.
2. Report other information in accordance with facility policy and professional standards of practice.

Nutrition and Hydration to Maintain Skin Integrity

Level III

Purpose

The purpose of this procedure is to provide guidelines for the assessment of resident nutritional needs, to aid in the development of an individualized care plan for nutritional interventions, and to help support the integrity of the skin through nutrition and hydration.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. When there is a decline in a resident's appetite, nutritional intake, weight, or overall condition, caregivers should first attempt to discover the factors compromising nutritional status and offer support with eating.
2. If intake continues to be inadequate, impractical, or impossible, nutritional support must be implemented according to the plan of care.
3. Ensure that interventions for nutrition and hydration are compatible with the individual's wishes and/or advance directives.
4. Although poor nutritional status is associated with increased risk of pressure ulcer development, no specific nutritional interventions have been proven conclusively to prevent or heal pressure ulcers.
5. Healing of acute (e.g., postoperative) and chronic (e.g., pressure ulcers) wounds requires enough protein and calories so that the body will not use lean body mass for energy and wound repair.
6. Recommended protein levels for a resident with wounds or at risk of developing wounds is approximately 1.2 – 1.5 gm/protein/kg body weight.
7. The recommended daily intake of protein may be adjusted according to clinical need and standards of clinical practice for specific conditions or situations.
8. Ensure that the resident's intake of fluid is sufficient. "Sufficient fluid" means the amount of fluid needed to prevent dehydration and maintain health.

Assessment

Nutritional Assessment

1. The Dietitian, in conjunction with the nursing staff and healthcare practitioners, will conduct a nutritional assessment for each resident upon admission and as indicated by a change in condition that places the resident at risk for impaired nutrition.
2. Reassessments will be conducted at least every three (3) months or more often if the resident's condition changes and/or he or she develops risk factors for impaired nutrition.
3. The nutritional assessment will be a systematic, multidisciplinary process that includes gathering and interpreting data and using that data to help define meaningful interventions for the resident at risk for or with impaired nutrition.

continues on next page

Hydration Assessment

1. A general guideline for determining baseline daily fluids needs is to multiply the resident's body weight in kg times 30mL (2.2 lbs = 1kg), except for residents with clinical conditions that necessitate fluid restriction (e.g., renal or cardiac distress).
2. The specific amount of hydration needed is specific for each resident, and fluctuates as the resident's condition fluctuates (e.g., increase fluids if resident has fever or diarrhea).
3. Risk factors for dehydration include:
 - a. coma/decreased sensorium;
 - b. fluid loss and increased fluid needs (e.g., diarrhea, fever, uncontrolled diabetes);
 - c. fluid restriction secondary to renal dialysis;
 - d. functional impairments that make it difficult to drink, reach fluids, or communicate fluid needs (e.g., aphasia);
 - e. dementia in which resident forgets to drink or forgets how to drink; and/or
 - f. refusal of fluids.

Interventions/Care Strategies

1. Interventions for the resident with wounds or at risk for developing wounds may include providing enough calories to stabilize weight and ensuring adequate protein intake given the resident's current weight and clinical situation.
2. Encourage the resident to eat as many calories and as much protein as tolerated.
3. Provide small, frequent meals and/or between-meal snacks to reach caloric and protein goals.
4. The use of tube feedings or supplementation (oral or TPN) will be determined by the Physician and multidisciplinary team.

Equipment and Supplies

The following equipment and supplies will be necessary when providing nutrition.

1. Nutritional screening/assessment tools;
2. Adaptive feeding devices in accordance with assessed needs and the plan of care; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Explain and ask resident's permission to conduct a nutritional assessment/reassessment.
2. Complete a nutritional assessment using nutrition screening/assessment tools, interview, observation and record review.
3. Review supportive ancillary documentation that impacts the nutritional assessment, including, but not limited to, the food and fluid consumption record (Appetite Sheet), weight and height records, laboratory results, and nursing notes.
4. Implement nutritional support and interventions according to the plan of care.

Documentation

The following information should be recorded in the resident's medical record:

1. The results of the nutritional assessment.
2. The name and title of the assessing Dietitian.

continues on next page

3. Dietary progress notes indicating progress and status related to care plan goals, and effectiveness of recommended interventions.
4. Food consumption.
5. Changes in the resident's nutritional status.
6. Problems or complaints reported by the resident related to nutrition.
7. If the resident refused nutrition, the reason(s) and explanation of risk, benefits and alternatives.
8. Observations of any unusual behaviors or symptoms exhibited by the resident.
9. Care plan interventions that address both nutritional deficits and risk factors.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure or interventions.
2. If the resident is refusing care, an evaluation of the basis for refusal, and the identification and evaluation of potential alternatives is indicated.
3. Report other information in accordance with facility policy and professional standards of practice.

Output, Measuring and Recording

Level II

Purpose

The purpose of this procedure is to accurately determine the amount of urine that a resident excretes in a 24-hour period.

Preparation

1. Verify that there is a physician's order for this procedure and/or that the procedure is being performed per facility policy.
2. Review the resident's care plan and provide for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Portable bedside commode, urinal, bedpan, or specipan;
2. Toilet tissue;
3. Graduate (measuring container);
4. Intake and output record;
5. Pen or pencil;
6. Paper towels; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the equipment on the bedside stand. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Be sure that the intake and output record is available.
4. Put on gloves.
5. Pour or drain the urine from the bedpan, urinal or catheter into the graduate (measuring container).
6. Place the measuring container on a flat surface (i.e., bedside stand, etc.). (Note: Be sure that the measuring container is placed on a paper towel. Do not place the container directly onto the surface.)
7. **Carefully** observe the level of urine in the graduate. Maintain eye level so that you can see the number reached by the level of the urine.
8. Record the amount noted on the output side of the intake and output record. Record in mLs.
9. Record the time the output was measured.
10. Collect specimens as instructed.
11. Pour urine down the commode. Flush the commode.
12. Wash, rinse, and return the graduate to its designated storage area per facility policy in accordance with infection control and privacy policies.
13. Clean the bedpan or urinal. Wipe dry with a clean paper towel. Discard paper towel into designated container. Store the bedpan or urinal per facility policy in accordance with infection control and privacy policies. Do not leave it in the bathroom or on the floor.

continues on next page

14. Remove gloves and discard into the designated container. Wash and dry your hands thoroughly.
15. Allow the resident to wash his or her hands. (Note: Use wash basin or clean wash cloth. Be sure water in basin is clean.)
16. Clean the bedside stand.
17. Discard all disposable items into designated containers.
18. Wash and dry your hands thoroughly.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded on the bedside intake and output record and/or in the resident's medical record:

1. The date and time the resident's urine output was measured and recorded.
2. The name and title of the individual who measured and recorded the resident's urine output.
3. The amount (in mLs) of output.
4. The amount and character of output.
5. If the resident refused the treatment, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Parenteral Lipid Administration

Level III

Purpose

The purpose of this procedure is to provide guidelines for the appropriate administration of lipids through a venous access device.

Preparation

1. A 1.2 micron filter is attached to the primary administration set (tubing) when lipids are administered.
2. An electronic infusion pump must be used with lipids and/or parenteral nutrition (PN).
3. Lipid administration requires a physician order. Lipid strength, volume, rate and frequency must be included in physician order.
4. Lipids are commonly ordered in conjunction with TPN/PPN solutions.

General Guidelines

1. Lipids are used to provide calories and/or essential fatty acids to residents who are not able to get sufficient oral intake.
2. Lipids may be administered mixed with parenteral nutrition or separately.
3. When lipids are administered concurrently with TPN, the lipid solution may be connected to primary tubing via “piggyback” attached below the filter if possible.
4. Administration sets used to administer lipid-based infusates such as intravenous fat emulsions (IVFE), total nutrient admixture (TNA), or total parenteral nutrition (TPN), should be free of diethylhexyl-phthalate (DEHP). DEHP is considered a toxin especially in neonates, pediatrics, and long term care patients.
5. The pharmacy may mix a 3 in 1 solution of PN with lipids which is delivered and administered as one bag.
6. Lipids can be administered through peripheral or central catheters if separate from PN.
7. Aseptic technique should be used at all times when administering lipids.
8. Lipids that are not mixed with PN solutions expire 12 hours after being started. If part of TNA, lipids expire 24 hours after being started.
9. Lipids that are not mixed with PN solutions do not require refrigeration.
10. Lipids must be inspected for signs of instability and deterioration prior to administration. Signs of instability include discoloration (other than white color), separation, oily appearance, and/or inconsistent texture.
11. Never shake lipid container or add anything to lipids; this could cause aggregation of fat globules.
12. No other medications or fluids are to be attached or added to the lipid solution.
13. Lipid administration is contraindicated in residents with:
 - a. Allergy to egg yolk;
 - b. Hepatic disease;
 - c. Hyperlipidemia; or
 - d. Blood coagulation defect caused by a depressed platelet count.

continues on next page

14. Monitor the resident receiving lipids for:
 - a. Signs/symptoms of adverse reactions such as fluid overload, chest pain, nausea, shortness of breath, abdominal pain, or wheezing;
 - b. Lab results for levels of triglycerides, cholesterol, and liver enzymes; and
 - c. Any signs/symptoms of catheter or resident infection.
15. Administration set (tubing), needleless access device, and container must be changed every **24 hours** and with each new container.

Equipment and Supplies

1. Lipid (or 3 in 1) solution;
2. Needleless access device;
3. Electronic infusion pump;
4. Administration set (tubing);
5. Non-sterile gloves;
6. Alcohol swabs;
7. 1.2 micron filter; and
8. Normal saline (preservative-free 0.9% sodium chloride) flushes (1-2).

Steps in the Procedure

1. Inspect lipid solution for discoloration or other signs of breakdown (separation, oily appearance, inconsistent texture). Do not administer if any signs of problems are observed.
2. Verify order, type of solution, rate, and the 5 “rights” of medication administration.
3. Assemble solution, tubing, needleless access cap, saline flushes, and alcohol wipes.
4. Perform hand antisepsis. Don non-sterile gloves.
5. Place tubing in container and prime tubing.
6. Close clamp on tubing, replace access device, and flush catheter with normal saline (per protocol).
7. To run “piggyback” into primary PN tubing, place at most distal side port (Y site) after cleansing port with alcohol.
8. Place tubing into pump and set rate as ordered.
9. Start pump and observe flow.
10. Note resident response to procedure.

Documentation

The following should be documented in the resident’s medical record:

1. Date, time, amount, and flow rate of lipids administered.
2. Solution and equipment change. Document in the treatment administration record.
3. Any observation facts related to catheter insertion site, problems with solution, resident reactions. Any interventions that were done.
4. Intake and output if ordered.

continues on next page

Reporting

1. Report any complications with treatment to physician, supervisor, and oncoming shift.
2. Report any problems with solution to pharmacy.
3. Report resident reaction to procedure.
4. Report other information in accordance with facility policy or professional standards of practice.

Version	2.0 (H5MAPR0307)

Parenteral Nutrition

Level III

Purpose

The purpose of parenteral nutrition (PN) is to provide guidelines for the safe and aseptic administration of partial or total nutrition to residents who have a need for supplemental nutrition.

Definitions

1. **Parenteral Nutrition (PN)** – A sterile pharmacy-prepared form of nutrition that is delivered through an intravenous route. It can be in the form of partial (PPN) or total (TPN) nutrition. It may or may not include lipids.
2. **Partial Parenteral Nutrition (PPN)** – May be referred to as peripheral parenteral nutrition. Final dextrose concentration <10% and osmolality <900mOsm/liter.
 - a. May be put through large gauge peripheral over the needle catheter (20 gauge or larger) or midline. *Central lines are preferred.*
 - b. Short term treatment (usually 7-10 days).
 - c. Must be regulated by an electronic pump.
3. **Total Parenteral Nutrition (TPN)** – Final dextrose concentration > 10% and osmolality of >900mOsm/liter.
 - a. Must be given through a central venous access device.
 - b. Must be regulated by an electronic pump.
 - c. Treatment for short or long term therapy.

Preparation

1. A physician's order is necessary for this treatment. The PN order should include the formula or a list of all individual ingredients/nutrients in the base solution, total volume and rate of administration as well as orders for monitoring laboratory results on a routine basis.
2. Parenteral nutrition should be started in a hospital setting due to a high risk of complications.
3. Residents will have had stable glucose levels and no complications for at least 48 hours in the hospital before being transferred to long term care.
4. Verify with State Nurse Practice Act the role of the Nurse and requirements for RN coverage on the unit while PN is infusing.
5. The long term care facility is responsible for having the proper staffing (per State Nurse Practice Act) before resident arrives in facility.
6. The assessment and management of PN residents is a multidisciplinary function involving the Dietitian, Physician, Nursing and Pharmacist.
7. The Physician may write orders for the Pharmacist to monitor and change the PN solution orders, in accordance with state practice laws.

General Guidelines

Handling and Storage:

1. Do not accept PN bags from any facility other than the pharmacy. Keep PN bags refrigerated and protected from light until shortly before use.

continues on next page

Safety Precautions:

1. Parenteral nutrition orders will include an order for dextrose 10% IV to run at the same rate as PN, in case the PN has to be stopped or discontinued suddenly.
2. The orders for PN and the PN bag labels must match. Otherwise, contact the pharmacy.
3. Avoid unplanned interruptions of PN.
4. Administer PN via an electronic pump. The solution must be filtered.
5. The size of the filter on the end of the IV tubing is determined by the type of solution:
 - a. 0.2 micron filter is used if solution does not contain intravenous fat emulsion (lipids).
 - b. 1.2 micron filters are used if lipids are in solution.
6. Use strict aseptic technique when handling PN.
7. For multi-lumen catheters, specify/label one lumen for PN use only. Do not use this lumen for other infusions or blood sampling.
8. Use only administration sets that are free of diethylhexyl-phthalate (DEHP) to administer PN.

Infusions:

1. Change PN bags at least every 24 hours.
2. Change administration set, filter, and needleless connection device with every new bag that is administered (at least every 24 hours).
3. Change fat emulsions (lipids) at least every 12 hours. If part of TNA, change every 24 hours.
4. Do not administer medications via “piggyback” or IV push through the PN tubing/lumen.
5. Do not disconnect tubing to administer another medication. The system must stay intact to maintain sterile system.
6. Only mix and administer additives with PN per facility/pharmacy protocol.

Monitoring:

1. Routinely monitor residents receiving TPN/PPN per facility protocol for the following signs and symptoms of complications:
 - a. Hypo/hyperglycemia;
 - b. Fluid/electrolyte imbalance;
 - c. Infection;
 - d. Malnutrition;
 - e. Catheter complication;
 - f. Change of mental status; and
 - g. Other potential complications associated with PN therapy.
2. Include the following clinical monitoring at regular intervals (per physician or pharmacy order):
 - a. Intake/output;
 - b. Glucose levels;
 - c. Urinalysis;
 - d. Electrolytes; and
 - e. Laboratory values (CBC, chemistry) or other labs per orders.

Equipment and Supplies

1. Parenteral nutrition solution*;
2. Fat emulsion (lipid) solution*;
3. Administration sets with in-line (or add-on) filtration systems;
4. Saline or heparin for flush, as appropriate;

continues on next page

5. Needleless access device/adaptor;
6. Electronic infusion pump;
7. Gloves;
8. Alcohol swabs; and
9. Tape.

*These may be in a 3 in 1 mixture.

Steps in the Procedure

1. Keep PN solution refrigerated and protected from light until shortly before administration.
2. Verify orders. Compare orders to bag label. Verify with second nurse if required by facility protocol.
3. Assess IV site and catheter for any complications.
4. Check resident chart for any allergies or special considerations.
5. Check lab results for appropriate use of therapy.
6. Do physical assessment, especially heart, lungs, and extremities, to determine if resident can tolerate large amounts of continuous fluids.
7. Check vital signs for any signs of complications.
8. Verify if there are any additives to be put in bag. If so, add before starting PN.
9. Verify identity of resident.
10. Inspect bag and equipment sterility, precipitate, expiration date, any separation of PN and lipids (if present). Call pharmacy if any problems are noted.
11. Perform hand antisepsis. Don non-sterile gloves.
12. Clean end of needleless access device on catheter with alcohol (70%).
13. Flush catheter with 0.9% sodium chloride (normal saline).
14. Attach tubing with filter to PN bag. Prime tubing and filter by opening roller clamp. Prime, then clamp tubing. Place sterile end cap on tubing.
15. Set pump with prescribed rate and volume (continuous or intermittent).
16. Clean end of needleless access device on catheter with alcohol (70%).
17. Connect end of filter (or tubing if filter is attached to catheter) into catheter connection device.
18. Check connections. Secure tubing to resident with tape.
19. Start infusion and monitor for proper flow and any complications.
20. Educate resident that her or she should notify the nurse if any problems develop such as shortness of breath, heart palpitations, catheter-related pain, or signs/symptoms of hypoglycemia/ hyperglycemia.
21. Monitor resident, insertion site, and flow at regular intervals (at least every 2 hours).
22. Dispose of flush syringes and equipment packaging properly.

Documentation

The following should be documented in the resident's medical record:

1. Date and time of administration.
2. Signature and title of nurse(s) checking and hanging PN bag and person monitoring infusion.
3. Rate and volume infused.
4. Additives. Document in the medicine administration record.
5. Infusion rate, and changing of PN bag, tubing, needleless access device, filter, and flushes.
6. Any complications, interventions, the condition of insertion site/dressing/catheter, any changes in PN formula, lab results, and the resident's response to procedure.

continues on next page

Reporting

1. Report any complications with PN infusion to physician, supervisor, and oncoming shift.
2. Report any changes in PN formula and lab results.

Version	2.1 (H5MAPR0209)

Parenteral Nutrition (PN) – Continuous vs. Cycled

Level III

Purpose

The purpose of this procedure is to explain the difference between continuous and cycled parenteral nutrition (PN) and to establish the guideline for tapering the rate of infusion when starting or stopping parenteral nutrition infusions.

Definitions

1. **Continuous Parenteral Nutrition** – The PN is infused at the **same rate** for **24 hours** a day. The solution bag and equipment are changed at approximately the same time each day. The system stays intact without interruption.
2. **Cycled Parenteral Nutrition** – The PN is infused for a shorter interval lasting **less than 24 hours**. The PN infuses for a time interval according to physician order. Many times this is done to accommodate resident schedules and allows for more freedom in lifestyle.

General Guidelines

1. The nurse must have received training and demonstrated competency related to the handling of PN prior to performing this procedure.
2. Use aseptic technique at all times when administering PN.
3. Parenteral nutrition should be delivered by midline or central line, according to the concentration of dextrose.
4. Guidelines for tapering **cycled parenteral nutrition** are as follows:
 - a. The rate **tapers upward for 1-2 hours** when starting the infusion.
 - b. Then the PN runs at a set rate for a determined time.
 - c. The rate **tapers downward for 1-2 hours** before the infusion is stopped or discontinued.
 - d. The time intervals and tapering rates will be determined by the physician or the pharmacist.
 - e. The bag is then disconnected from the catheter and discarded.
 - f. The catheter is flushed with saline/heparin per protocol.
5. **Never stop or discontinue parenteral nutrition suddenly.**
 - a. The PN rate must be tapered downward over several hours to allow the pancreas to adjust to the decrease in glucose intake (and the subsequent decreased need for insulin). This will help prevent hypoglycemia.

continues on next page

- b. Total parenteral nutrition (TPN) (>10% dextrose) orders should include dextrose 10% IV fluid to be used if for some reason the TPN has to be stopped suddenly or is not available.
- c. The Dextrose 10% should be run at the same rate that the TPN was running. The Dextrose 10% can be run on an IV flow regulator tubing until TPN and pump are available.

Version	1.2 (H5MAPR0306)

Parenteral Nutrition - Placement of Additives

Level III

Purpose

The purpose of this procedure is to establish guidelines for placing additives in the parenteral nutrition (PN) mixture.

Preparation

1. Verify with state Nurse Practice Act the role of the licensed nurse and requirements for RN coverage on the unit while PN is infusing.
2. The nurse placing the additives into the PN bag must have received training and demonstrated competency related to the handling of PN prior to performing this procedure.
3. Maintain aseptic technique when working with PN. The room where the additives are placed in PN bag **must** be clean and away from general traffic.
4. Check expiration dates on additive bottles/vials and inspect the PN solution for deterioration or breakdown before placing additives.
5. Check additives for compatibility before adding to the PN solution.

General Guidelines

1. Additives are medications or supplements that are added to the PN solution just before infusing the PN. Examples of additives include multi-vitamins, vitamin K, H₂ blockers and regular insulin.
2. Medications added to PN are stable for \leq 24 hours. Parenteral nutrition solutions may be delivered from the pharmacy in quantities that last 3-4 days. Therefore, medications are added to the PN at the facility rather than at the pharmacy.
3. Additives and/or medications added to the PN solution must be handled in a manner that is compliant with USP<797> Guidelines for Compounding Sterile Preparations.
4. If the following criteria are met, the preparation is designated "Immediate-Use" and is exempt from ISO 5 (hood) and ISO 7 (cleanroom) USP <797> requirements:
 - a. There are no more than three additives.
 - b. None of the additives are considered hazardous.
 - c. The transfer of substances does not involve more than two entries into any one container or package of sterile infusion solution or administration container (e.g., bag or vial).
 - d. Compounding is a continuous process, and can be completed in under one hour.
 - e. Aseptic technique is maintained, and the compound is under constant surveillance.
 - f. Administration begins no later than one hour after the preparation begins.
 - (1) If not administered immediately, the preparation will be labeled with the one-hour BUD.
 - (2) If administration is not initiated within one hour after the preparation begins, it will be discarded.
 - g. The preparation must be administered immediately and completely (or the administration witnessed) by the person who prepared it, OR the CSP must be labeled with:
 - (1) the resident/patient identification information;
 - (2) the names and amount of all ingredients;
 - (3) the name or initials of the person who prepared the CSP;
 - (4) the exact 1-hour beyond-use date (BUD) and time.

continues on next page

5. Other general guidelines include:
 - a. Place additives in PN bag before the bag is connected to the resident. Never add medications while PN is infusing; this could result in a bolus dose of medication.
 - b. Place additives in the PN mixture immediately before administering the PN to the resident.
 - c. Add medications to the PN bag one at a time using a new syringe for each medication.
 - d. When additive is placed in bag, rotate bag back and forth. DO NOT SHAKE BAG.

Equipment and Supplies

1. Parenteral nutrition solution;
2. Alcohol wipes;
3. Filter straw for glass medication ampules;
4. Sterile syringe for each additive;
5. Sterile injection needle(s) or needleless system to access medication containers and injection port of bag;
6. Sharps container;
7. Non-sterile gloves; and
8. Waterproof barrier for counter top.

Steps in the Procedure

1. Verify orders for PN. Check orders against PN bag label. If they do not match, call pharmacy and verify.
2. Verify orders for additives.
3. Check compatibility of medications.
4. Clean countertop with alcohol, soap and water, or antimicrobial solution. Place waterproof barrier on counter top.
5. Perform hand antisepsis. Don non-sterile gloves.
6. Assemble equipment and medication additives.
7. Clean injection port of PN bag with 70% alcohol wipes.
8. Draw up additives one at a time in separate sterile syringes. Use filter straw to draw up medications from glass ampules.
9. Place additives into PN bag one at a time. Rotate bag back and forth gently in between medications to mix medicines. DO NOT SHAKE BAG.
10. Wipe injection port with alcohol in between each additive.
11. Document medications added to the PN solution on a label affixed to the PN bag.
12. Prepare bag to be hung after the addition of additives.
13. Discard used equipment according to facility procedure.

Documentation

The following should be documented in the resident's medical record:

1. Additives (document on label affixed to PN bag AND medication administration record).
2. If there was any visible deterioration in the PN solution and notification of the pharmacy.
3. Any communication with physician, supervisor, or oncoming shift (document in the nurses' notes).

continues on next page

Reporting

1. Report any problems or complications with the PN solution or the additives to the pharmacy.
2. Report any complications with the procedure to the Director of Nursing Services or the physician.
3. Report any changes in the resident's condition to the physician.
4. Any changes in PN formula.

Serving Drinking Water

Level I

Purpose

The purposes of this procedure are to provide the resident with a fresh supply of drinking water and to provide adequate fluids for the resident.

Preparation

1. Drinking water shall be obtained from an approved source that is:
 - a. A public water system; or
 - b. A nonpublic water system that is constructed, maintained and operated according to applicable state/federal law.
2. Verify that there is **not** a physician's order for **NPO** (nothing by mouth) or any fluid or ice restrictions before serving drinking water to the resident.
3. Review the resident's care plan and provide for any special needs of the resident.
4. Residents who are not permitted to have ice may receive tap water only. (Note: Notice on resident's drinking cup will be marked "**Omit Ice.**")
5. When in doubt about serving ice water or other fluids to a resident, check with your supervisor.
6. Assemble the equipment and supplies necessary to perform the procedure. Arrange them on the rolling cart.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Movable serving cart;
2. Ice chest and cover;
3. Ice;
4. Scoop;
5. Water pitcher and cup;
6. Flexible straw;
7. Paper towels; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Fill the ice chest with ice. Cover the chest.
2. Roll the cart to the outside entrance of the resident's room.
3. Go to the resident's bedside stand and pick up the water pitcher.
4. Take the water pitcher into the bathroom. Empty the contents into the commode. Flush the commode.
5. Rinse the water pitcher with tap water. Pour the water down the sink.
6. Fill the water pitcher one-half full with tap water.
7. Unless the resident is in isolation, take the water pitcher to the ice cart outside the room. Fill the pitcher with ice. Do not let the ice scoop touch the water pitcher.
8. Return the water pitcher to the resident's bedside stand.

continues on next page

9. Wipe the bedside stand with a clean paper towel. Discard used paper cups, paper towels and other disposable items into designated container.
10. Offer the resident a fresh cup of water.
11. Place the water pitcher and cup within easy reach of the resident. Place flexible straws next to the water pitcher.
12. Repeat steps 2 through 11 until the procedure has been completed for each of your assigned residents. Wash your hands.

Documentation

The person performing this procedure should record the following information:

1. The time that the procedure was performed. (Note on daily flow sheet or record.)
2. The name and title of the individual(s) who performed the procedure.
3. If the resident refused the drinking water, the reason(s) why and the intervention taken.
4. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the drinking water.
2. Report other information in accordance with facility policy and professional standards of practice.

Monitoring Residents on Patient-Controlled Analgesia

Pain – Clinical Protocol

Assessment and Recognition

1. The physician and staff will identify individuals who have pain or who are at risk for having pain.
 - a. This includes reviewing known diagnoses and conditions that commonly cause pain; for example, degenerative joint disease, rheumatoid arthritis, osteoporosis (with or without vertebral compression fractures), diabetic neuropathy, oral or dental pathology, and post-stroke syndromes.
 - b. It also includes a review for any treatments that the resident currently is receiving for pain, including complementary and non-pharmacologic treatments.
2. The nursing staff will assess each individual for pain upon admission to the facility, at the quarterly review, whenever there is a significant change in condition, and when there is onset of new pain or worsening of existing pain.
3. The staff and physician will identify the characteristics of pain such as location, intensity, frequency, pattern, and severity.
 - a. Staff will use a consistent approach and a standardized pain assessment instrument appropriate to the resident's cognitive level.
4. The nursing staff will identify any situations or interventions where an increase in the resident's pain may be anticipated; for example, wound care, ambulation, or repositioning.
5. The staff and physician will evaluate how pain is affecting mood, activities of daily living, sleep, and the resident's quality of life, as well as how pain may be contributing to complications such as gait disturbances, social isolation, and falls.

Cause Identification

1. The physician will help identify causes of pain; for example, by examining the resident directly, reviewing the resident's history, and via discussion with the resident and staff.
2. The physician will help identify the extent to which underlying causes of pain can be addressed or reversed.
3. The physician will perform or order appropriate tests as needed to help clarify sources of pain. For example, an x-ray may help to identify the cause of joint pain.

Treatment/Management

1. With input from the resident to the extent possible, the physician and staff will establish goals of pain treatment; for example, freedom from pain with minimal medication side effects, less frequent headaches, or improved functioning, mood, and sleep.
2. The physician will order appropriate non-pharmacologic and medication interventions to address the individual's pain.
 - a. Pain medications should be selected based on pertinent treatment guidelines. Generally, and to the extent possible, an analgesic regimen should utilize the simplest regimen and lowest risk medications before using more problematic or higher risk approaches.

continues on next page

3. Staff will provide the elements of a comforting environment and appropriate physical and complementary interventions; for example, local heat or ice, repositioning, massage, and the opportunity to talk about chronic pain.
4. For the individual who is receiving opioid analgesics, the physician will order a regimen of laxatives and other measures to prevent constipation.

Monitoring

1. The staff will reassess the individual's pain and related consequences at regular intervals; at least each shift for acute pain or significant changes in levels of chronic pain and at least weekly in stable chronic pain.
 - a. Review should include frequency, duration and intensity of pain, ability to perform activities of daily living (ADLs), sleep pattern, mood, behavior, and participation in activities.
2. The staff will evaluate and report the resident/patient's use of standing and PRN analgesics.
 - a. Depending on the characteristics of pain, the physician may start with PRN doses or supplement standing doses with PRN doses for breakthrough pain.
 - b. If there are more than occasional analgesic requests, the physician will consider changing to regular administration of at least one analgesic with another medication for PRN use, increasing the standing dose of an existing analgesic, switching to another analgesic, and/or adding nonpharmacological measures.
3. Periodically the physician will evaluate and summarize the status of an individual with chronic or fluctuating pain including the status of any active conditions that exacerbate pain, consequences or complications of pain, and effectiveness of current interventions for pain.
4. The staff and physician will monitor for adverse effects of pain medications such as gastrointestinal bleeding from nonsteroidal anti-inflammatory drugs (NSAIDs), and anorexia, confusion, lethargy, severe constipation related to opioids.
 - a. The physician will adjust or discontinue medications accordingly, based on effectiveness and side effects.
5. If the resident's pain is complex or not responding to standard interventions, the Attending Physician may consider additional consultative support.
 - a. If a consultant is involved in managing pain, the attending physician will maintain an active role by reviewing the consultant's recommendations, addressing medical issues that affect pain, monitoring for complications related to treatment, and evaluating subsequent progress.
 - b. The physician should not simply defer to the consultant for all pain-related issues.
6. If pain is stable and the underlying cause is resolved or it is unclear whether a source of pain remains, the physician will consider a trial reduction or elimination of analgesic medication; for example, reduce the standing dose of an analgesic and see if there is any change in pain-related symptoms or use of PRN analgesics.
 - a. Reductions in opioid analgesics are especially important in light of their limited efficacy in the treatment of chronic non-cancer pain and their many diverse significant side effects.
 - b. Based on results of attempted dose reductions, the physician should document a clinically significant rationale for not attempting further analgesic reduction. It should not just be assumed that the absence of pain symptoms implies the need for indefinite analgesic administration. Sometimes a trial tapering or discontinuation of analgesics is indicated to determine if current medications or doses are still needed.

Administering Pain Medications

Level III

Purpose

The purpose of this procedure is to provide guidelines for assessing the resident's level of pain prior to administering analgesic pain medication.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. The pain management program is based on a facility-wide commitment to appropriate assessment and treatment of pain, based on professional standards of practice, the comprehensive care plan, and the resident's choices related to pain management.
2. "Pain management" is defined as the process of alleviating the resident's pain based on his or her clinical condition and established treatment goals.
3. Pain management is a multidisciplinary care process that includes the following:
 - a. Assessing the potential for pain;
 - b. Recognizing the presence of pain;
 - c. Identifying the characteristics of pain;
 - d. Addressing the underlying causes of the pain;
 - e. Developing and implementing approaches to pain management;
 - f. Identifying and using specific strategies for different levels and sources of pain;
 - g. Monitoring for the effectiveness of interventions; and
 - h. Modifying approaches as necessary.
4. Cognitive, cultural, familial, or gender-specific influences on the resident's ability or willingness to verbalize pain are considered when assessing and treating pain. Comprehensive pain assessments are conducted upon admission to the facility, at the quarterly review, whenever there is a significant change in condition, and when there is onset of new pain or worsening of existing pain.
5. Acute pain (or significant worsening of chronic pain) should be assessed every 30 to 60 minutes after the onset and reassessed as indicated until relief is obtained.
6. For stable chronic pain the resident's pain and consequences of pain are assessed at least weekly.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Standardized pain assessment tools, as indicated per facility protocol. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the purpose of the assessment to the resident.
3. Conduct a pain assessment as indicated. The initial assessment is comprehensive and should follow the facility pain assessment procedure.
4. Conduct an abbreviated pain assessment if there has been no change of condition since the previous assessment. The assessment shall consist of at least the following components:
 - a. Whether pain has improved or worsened since the last assessment;
 - b. The general condition of the resident;
 - c. Verbal and non-verbal signs of pain;
 - d. Level of consciousness; and
 - e. Evidence or reports of adverse consequences related to medications.
5. Evaluate and document the effectiveness of non-pharmacologic interventions (e.g., repositioning, warm or cold compresses, etc.).
6. Administer pain medications as ordered. If there are signs or symptoms of serious adverse consequences related to narcotic (opioid) analgesics (including somnolence, delirium, respiratory depression), notify the practitioner prior to administering.
7. Place the call light within easy reach of the resident.
8. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
9. Re-evaluate the resident's level of pain 30-60 minutes after administering.

Documentation

Document the following in the resident's medical record:

1. Results of the pain assessment;
2. Medication;
3. Dose;
4. Route of administration; and
5. Results of the medication (adverse or desired).

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Intravenous Pain Management

Level III

Purpose

The purpose of this procedure is to provide guidelines for the safe and aseptic administration of intravenous (IV) pain medication.

Preparation

1. Verify with state Nurse Practice Act LPN/RN scope of practice for this procedure.
2. A physician's order is necessary for this procedure.
3. Review the resident's care plan to assess for any special needs of the resident.
4. Assemble the equipment and supplies as needed.
5. The licensed nurse responsible for administering IV pain therapy shall be knowledgeable of:
 - a. indications for use;
 - b. appropriate doses and diluents;
 - c. side effects;
 - d. contraindications;
 - e. toxicities;
 - f. incompatibilities;
 - g. stability;
 - h. storage requirements;
 - i. potential complications; and
 - j. conventional and alternative methods of pain control.
6. Follow state Nurse Practice laws regarding scope of practice for administering prescribed intravenous pain medicine.
7. Anaphylaxis and naloxone medication protocols/orders/medications must be in place in the facility prior to the administration of IV pain medication.
8. Do not leave narcotic bags or cassettes in an unsecured locked area when not in use for resident infusion.

General Guidelines

1. First Dose of medication should be given in a situation in which close observation of resident and the ability to intervene in the case of complications is possible.
2. Frequent observation of the resident is necessary when IV pain medication is given. Monitor for pain control, change in vital signs, mental status, breathing status, nausea/vomiting, rash, or intolerance of medication.
3. Use a separate administration set for each medication.
4. When administering continuous IV or subcutaneous pain medication, use electronic infusion device to monitor rate of infusion.
5. Choose proper type of intravenous catheter to accommodate type of medication and duration of treatment.

Equipment and Supplies

1. Prescribed medication;
2. Administration set;

continues on next page

3. Saline (preservative-free 0.9% sodium chloride) or heparin for flush, as appropriate;
4. Needleless access device/adaptor;
5. Electronic infusion pump;
6. Gloves;
7. Alcohol swabs; and
8. Tape.

Assessment

1. Inspect intravenous catheter site for signs of complications at scheduled intervals and upon routine site care and administration set changes.
2. Prior to administration of pain medications assess resident's:
 - a. level of pain using appropriate pain scale;
 - b. level of consciousness;
 - c. history of allergies; and
 - d. baseline vital signs, height and weight.
3. Prior to administration of intravenous pain medication, assess the resident for risk factors for respiratory depression and other adverse events, including:
 - a. age;
 - b. morbid obesity;
 - c. obstructive sleep apnea;
 - d. COPD; and
 - e. renal insufficiency.
4. Monitor resident during administration of pain medication for signs of:
 - a. respiratory depression;
 - b. level of consciousness/confusion;
 - c. unsteady gait, risk of falling;
 - d. nausea and vomiting;
 - e. pruritus;
 - f. constipation;
 - g. urinary retention; and/or
 - h. hypotension or hypertension.
5. Review physician's order. Confirm type and amount of medication, route, and rate of administration.
6. Verify the identity of the resident.
7. Check medication label and verify against the order.
8. Inspect medication for any leaks, cracks, precipitate and expiration date.

Steps in the Procedure

1. Perform hand antisepsis and don non-sterile gloves.
2. Prime tubing of administration set.
3. Disinfect catheter injection/access port.
4. Flush catheter.
5. Connect primed administration set to catheter injection/access device.
6. Open clamp on tubing.

continues on next page

7. **Establish prescribed rate of flow using an electronic infusion pump.**
 - a. Follow orders for amount to be infused and duration.
 - b. Follow manufacturer's directions to program pump.
 - c. Program to achieve desired flow rate.
8. Begin infusion.
9. Instruct resident on expected outcomes and potential side effects.
10. Use pulse oximeter to monitor for respiratory depression.
11. Monitor resident closely. Assess and re-assess the resident for:
 - a. current level of pain;
 - b. side effects of pain medications; and
 - c. adverse reactions to pain medication.
12. When infusion is complete, clamp tubing and disconnect from catheter.
13. If tubing will be reused, replace sterile end cap on tubing.
14. Flush catheter per protocol.
15. Document procedure in the resident's medical record.

Documentation

1. The following should be documented in the resident's medical record, and/or narcotic control record:
 - a. Results of the initial and/or follow-up pain assessments.
 - b. Any complications, side effects, problems with infusion, change in dose, refusal of medication.
 - c. Any communication with physician, supervisor, or oncoming shift.
 - d. Any waste of narcotic when treatment is finished.
 - e. Effectiveness of pain treatment, per resident statement or use of scale.
 - f. Any changes in orders.
 - g. Condition of catheter and any complications/interventions.
2. Document narcotic administration in appropriate controlled medication record.

Reporting

The following should be reported to physician, supervisor, and oncoming shift as per facility policy:

1. Resident refusal of treatment.
2. New onset or worsening of assessed or resident-reported pain level.
3. Effectiveness of treatment.
4. Any side effects or complications from treatment/interventions.
5. Resident statement regarding tolerance of treatment.

Pain Assessment and Management

Level III

Purpose

The purposes of this procedure are to help the staff identify pain in the resident, and to develop interventions that are consistent with the resident's goals and needs and that address the underlying causes of pain.

General Guidelines

1. The pain management program is based on a facility-wide commitment to appropriate assessment and treatment of pain, based on professional standards of practice, the comprehensive care plan, and the resident's choices related to pain management.
2. "Pain management" is defined as the process of alleviating the resident's pain based on his or her clinical condition and established treatment goals.
3. Pain management is a multidisciplinary care process that includes the following:
 - a. Assessing the potential for pain;
 - b. Recognizing the presence of pain;
 - c. Identifying the characteristics of pain;
 - d. Addressing the underlying causes of the pain;
 - e. Developing and implementing approaches to pain management;
 - f. Identifying and using specific strategies for different levels and sources of pain;
 - g. Monitoring for the effectiveness of interventions; and
 - h. Modifying approaches as necessary.
4. Cognitive, cultural, familial, or gender-specific influences on the resident's ability or willingness to verbalize pain are considered when assessing and treating pain. Comprehensive pain assessments are conducted upon admission to the facility, at the quarterly review, whenever there is a significant change in condition, and when there is onset of new pain or worsening of existing pain.
5. Acute pain (or significant worsening of chronic pain) should be assessed every 30 to 60 minutes after the onset and reassessed as indicated until relief is obtained.
6. For stable chronic pain the resident's pain and consequences of pain are assessed at least weekly.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Standardized pain assessment tool, as indicated per facility protocol; and
2. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

Recognizing Pain

1. Observe the resident (during rest and movement) for physiologic and behavioral (non-verbal) signs of pain.
2. Possible **Behavioral Signs of Pain, including:**
 - a. Verbal expressions such as groaning, crying, screaming;
 - b. Facial expressions such as grimacing, frowning, clenching of the jaw, etc.;
 - c. Changes in gait, skin color and vital signs;
 - d. Behavior such as resisting care, irritability, depression, decreased participation in usual activities;
 - e. Limitations in his or her level of activity due to the presence of pain;
 - f. Guarding, rubbing or favoring a particular part of the body;
 - g. Difficulty eating or loss of appetite;
 - h. Insomnia; and
 - i. Evidence of depression, anxiety, fear or hopelessness.
3. Possible **Physiological Signs of Pain, including:**
 - a. Increased blood pressure;
 - b. Tachycardia;
 - c. Increased respirations;
 - d. Diaphoresis;
 - e. Anorexia; or
 - f. Somnolence.
4. Ask the resident if he/she is experiencing pain. Be aware that the resident may avoid the term “pain” and use other descriptors such as throbbing, aching, hurting, cramping, numbness or tingling.
5. Review the medication administration record to determine how often the individual requests and receives PRN pain medication, and to what extent the administered medications relieve the resident’s pain.

Assessing Pain:

1. During the comprehensive pain assessment gather the following information as indicated from the resident (or legal representative):
 - a. History of pain and its treatment, including pharmacological and non-pharmacological interventions;
 - b. Characteristics of pain:
 - (1) Location of pain;
 - (2) Intensity of pain (as measured on a standardized pain scale);
 - (3) Characteristics of pain (e.g., aching, burning, crushing, numbness, burning, etc.);
 - (4) Pattern of pain (e.g., constant or intermittent); and
 - (5) Frequency, timing and duration of pain.
 - c. Impact of pain on quality of life;
 - d. Factors that precipitate or exacerbate pain;
 - e. Factors and strategies that reduce pain; and
 - f. Symptoms that accompany pain (e.g., nausea, anxiety).
2. Assess pain using a consistent approach and a standardized pain assessment instrument appropriate to the resident’s cognitive level.
3. Discuss with the resident (or legal representative) his or her goals for pain management and satisfaction with the current level of pain control.

continues on next page

Identifying the Causes of Pain:

1. Review the MDS and other documentation for indications of the onset or worsening of pain symptoms. Indicators of pain may include MDS items such as sleep cycle, changes in mood, decline in function, weight loss and skin conditions.
2. Review the resident's clinical record to identify conditions or situations that may predispose the resident to pain, including:
 - a. Musculoskeletal Conditions:
 - (1) Degenerative joint disease;
 - (2) Rheumatoid arthritis;
 - (3) Osteoporosis;
 - (4) Fractures; and
 - (5) Amputation.
 - b. Skin/Wound Conditions:
 - (1) Pressure, venous or arterial ulcers; and
 - (2) Surgical incision.
 - c. Neurological conditions such as multiple sclerosis:
 - (1) Neuropathy;
 - (2) Headache;
 - (3) Head trauma; and
 - (4) Post-stroke syndrome.
 - d. Circulatory/Heart:
 - (1) Angina;
 - (2) DVT; and
 - (3) Peripheral vascular disease.
 - e. Gastrointestinal:
 - (1) Gastroesophageal reflux disease;
 - (2) Inflammatory bowel disease; and
 - (3) Constipation.
 - f. End of life/Hospice Care;
 - g. Oral health conditions; or
 - h. Infection:
 - (1) Urinary tract infection; and
 - (2) Pneumonia.
3. Review the resident's treatment record or recent nurses' notes to identify any situations or interventions where an increase in the resident's pain may be anticipated, for example:
 - a. Bathing, dressing, or other ADLs;
 - b. Treatments such as wound care or dressing changes;
 - c. Ambulation or physical therapy; and/or
 - d. Turning or repositioning.
4. In some cases the underlying causes of pain cannot be determined.

Defining Goals and Appropriate Interventions:

1. The pain management interventions shall be consistent with the resident's goals for treatment. Such goals will be specifically defined and documented. For example, freedom from pain with minimal medication side effects, less frequent headaches, or improved functioning, mood, and sleep.
2. Pain management interventions shall reflect the sources, type and severity of pain.

continues on next page

3. Pain management interventions shall address the underlying causes of the resident's pain. For example, if there is acute pain associated with an infected wound the intervention shall address treating the infection in addition to pain control.
4. For those situations where the cause of the resident's pain has not been or cannot be determined, follow current standards of practice for managing pain to help determine appropriate options.

Implementing Pain Management Strategies:

1. Non-pharmacological interventions may be appropriate alone or in conjunction with medications. Some non-pharmacological interventions include:
 - a. Environmental – adjusting the room temperature, smoothing the linens, providing a pressure-reducing mattress, repositioning, etc.;
 - b. Physical – ice packs, cool or warm compresses, baths, transcutaneous electrical nerve stimulation (TENS), massage, acupuncture, etc.;
 - c. Exercise – range of motion exercises to prevent muscle stiffness and contractures; and
 - d. Cognitive or Behavioral – relaxation, music, diversions, activities, etc.
2. Pharmacological interventions (i.e., analgesics) may be prescribed to manage pain, however they do not usually address the cause of pain and can have adverse effects on the resident (e.g., drowsiness, increased risk of falling; loss of appetite).
3. The physician and staff will establish a treatment regimen based on consideration of the following:
 - a. The resident's medical condition;
 - b. Current medication regimen;
 - c. Nature, severity and cause of the pain;
 - d. Course of the illness; and
 - e. Treatment goals.
4. Strategies that may be employed when establishing the medication regimen include:
 - a. Starting with lower doses and titrating upward as necessary;
 - b. Administering medications around the clock rather than PRN;
 - c. Combining long-acting medications with PRNs for breakthrough pain;
 - d. Combining non-narcotic analgesics with narcotic (opioid) analgesics; and
 - e. Reducing or preventing anticipated adverse consequences of medications (e.g., bowel regimen to preventing constipation related to opioid analgesics).
5. Implement the medication regimen as ordered, carefully documenting the results of the interventions.

Monitoring and Modifying Approaches:

1. Re-assess the resident's pain and consequences of pain at least each shift for acute pain or significant changes in levels of chronic pain and at least weekly in stable chronic pain.
2. Monitor the following factors to determine if the resident's pain is being adequately controlled:
 - a. The resident's response to interventions and level of comfort over time;
 - b. The status of the underlying cause(s) of pain, if identified previously; and
 - c. The presence of adverse consequences to treatment.
3. Monitor the resident by performing a basic assessment with enough detail and, as needed, with standardized assessment tools (e.g., approved pain scales, etc.) and relevant criteria for measuring pain management (e.g., target signs and symptoms).
4. If pain has not been adequately controlled, the multidisciplinary team, including the physician, shall reconsider approaches and make adjustments as indicated.

continues on next page

- If pain symptoms have resolved or there is no longer an indication for pain medication, the multidisciplinary team and physician shall try to discontinue or taper analgesic medications to the extent possible.

Documentation

- Document the resident's reported level of pain with adequate detail (i.e., enough information to gauge the status of pain and the effectiveness of interventions for pain) as necessary and in accordance with the pain management program.
- Upon completion of the pain assessment, the person conducting the assessment shall record the information obtained from the assessment in the resident's medical record.

Reporting

Report the following information to the physician or practitioner:

- Significant changes in the level of the resident's pain;
- Adverse effects from pain medications, such as gastrointestinal bleeding from nonsteroidal anti-inflammatory drugs (NSAIDs), anorexia, confusion, lethargy, severe constipation, or ileus related to opioids; and/or
- Prolonged, unrelieved pain despite care plan interventions.

Version	2.0 (H5MAPR0208)

Patient-Controlled Analgesia

Level III

Purpose

The purpose of this procedure is to provide guidelines for safe and effective administration of intravenous (IV) pain medication through patient-controlled analgesia (PCA).

Preparation

1. Verify with state Nurse Practice Act LPN/RN scope of practice for this procedure.
2. A physician's order is necessary for this procedure. The physician's order will include:
 - a. medication;
 - b. medication concentration;
 - c. IV solution and infusion rate;
 - d. mode of delivery;
 - e. loading dose;
 - f. PCA dose;
 - g. basal rate; and
 - h. lockout interval.
3. Review the care plan to assess for any special needs.
4. Assemble the equipment and supplies as needed.

Definitions:

1. **Loading dose** – the initial dose given prior to initiating PCA therapy.
2. **PCA dose** – the amount of medication delivered by activating the PCA pump.
3. **Basal rate** – an amount delivered continuously during PCA therapy. (**Note:** This is not typically prescribed unless the patient is opioid tolerant.)
4. **Lockout interval** – the period of time during which the patient cannot self-administer medication through the PCA pump.
5. **Opioid tolerance** – patients who have taken at least 60 mg of morphine (or 30 mg of oxycodone; or 8 mg of oral hydromorphone; or the equivalent dose of another opioid) daily for a week or longer. Patients who do not meet the criteria for opioid tolerance are considered *opiate naïve*.
6. **Authorized agent-controlled analgesia (AACCA)** – a consistently available and competent individual is given authorization and training by the provider to activate the dosing button on the PCA for residents who are unable to utilize PCA independently. This individual may be a family member, nurse or caregiver.

General Guidelines

1. Follow facility policy regarding orders, clinical competency and monitoring of residents on PCA.
2. The IDT will assess the resident to determine if he or she is an appropriate candidate for PCA.

continues on next page

3. Upon initial setup, after a pump refill, or after a programming change, have two clinicians double-check the following:
 - a. the name of the patient;
 - b. the drug;
 - c. the concentration (standardized concentrations from the pharmacy);
 - d. PCA pump settings; and
 - e. the line attachment.
4. Have supplemental oxygen and an opioid antagonist (naloxone) on hand, as ordered.
5. Assess the IV site per facility protocol.

Equipment and Supplies

1. Prescribed medication cartridge, syringe, or bag;
2. PCA pump and key;
3. Pain and sedation assessment tools; and
4. Medication administration record.

Assessment

1. Inspect intravenous catheter site for signs of complications at scheduled intervals and upon routine site care and administration set changes.
2. Prior to administration of intravenous pain medications assess resident's:
 - a. appropriateness of PCA therapy, including the resident's ability to comprehend instructions and participate in therapy;
 - b. the availability of an authorized agent for AACA, if appropriate;
 - c. level of pain using approved pain scale;
 - d. level of agitation and/or sedation;
 - e. respirations (rate and quality);
 - f. oxygen saturation;
 - g. ventilation (ETCO₂, if available); and
 - h. allergies.
3. Prior to administration of intravenous pain medication, assess the resident for risk factors for respiratory depression and other adverse events, including:
 - a. age;
 - b. morbid obesity;
 - c. obstructive sleep apnea;
 - d. COPD; and
 - e. renal insufficiency.

Patient/Family Education

1. The nurse will provide patient and family education before PCA is administered.
2. Written educational materials will be provided to reinforce verbal teaching.

continues on next page

3. Education will include the following:
 - a. a description of PCA;
 - b. the patient, AACA and family roles in pain management;
 - c. the goals of pain management;
 - d. pump operation;
 - e. how to activate a PCA dose;
 - f. the importance of not administering “unauthorized” PCA doses (PCA by proxy);
 - g. safety features of the pump, including lockout intervals and time-dose limits;
 - h. what to expect in terms of patient monitoring and frequent assessments;
 - i. potential side effects of narcotic analgesia; and
 - j. when to alert the nurse.

Changing the PCA Cartridge/Syringe

1. Review physician’s order. Confirm type and amount of medication, route, rate of administration and PCA pump parameters.
2. Have another nurse check and sign off on the medication and pump parameters (see General Guidelines).
3. Wash hands.
4. Verify the identity of the resident.
5. Check the patient’s established primary IV line.
6. Make sure the PCA medication is compatible with any medication in the primary IV line.
7. Remove the PCA medication from the narcotics cabinet and sign out on the controlled medication record.
8. Inspect medication for leaks, cracks, precipitate and expiration date.
9. Open the door to the PCA pump with the key and insert the cartridge/syringe.
10. Close and lock pump door.
11. Follow the prompts on the pump to establish PCA settings. (Note: the key may need to remain in the lock in order to change pump settings.)
12. Have another nurse verify the settings.
13. Start infusion.

Monitoring

1. Monitor resident during administration of pain medication for the following:
 - a. Level of pain;
 - b. Respiratory rate and quality (depth, effort and sound);
 - c. Sedation;
 - d. Oxygen saturation (SpO₂ on room air);
 - e. Unsteady gait, risk of falling;
 - f. Nausea and vomiting;
 - g. Pruritus;
 - h. Constipation;
 - i. Urinary retention; and
 - j. Hypotension or hypertension.
2. Monitoring frequency will be based on facility-approved PCA monitoring protocol (see below for example).

continues on next page

Documentation

1. Document narcotic administration in appropriate medication administration record.
2. Document results of monitoring on flow-sheet.
3. Document PCA doses on flow sheet.
4. The following should be documented in the resident's medical record, and/or narcotic control record if applicable:
 - a. Results of the initial and/or follow-up pain assessments;
 - b. Complications, side effects, problems with infusion, change in dose, refusal of medication;
 - c. Communication with physician, supervisor, or oncoming shift;
 - d. Waste of narcotic when treatment is finished;
 - e. Effectiveness of pain treatment, per resident statement or use of scale;
 - f. Changes in orders; and
 - g. Condition of catheter and any complications/interventions.

Reporting

The following should be reported to physician, supervisor, and oncoming shift as per facility policy.

1. Resident refusal of treatment.
2. New onset or worsening of assessed or resident-reported pain level.
3. Increased sedation.
4. Respiratory depression.
5. Other side effects or complications from treatment/interventions.

Chronic Obstructive Pulmonary Disease (COPD) – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals with a history of COPD or other chronic respiratory conditions.
 - a. Examples include a review of recent hospitalizations for exacerbations of existing COPD or respiratory failure, chest X-Ray results showing changes consistent with COPD, or results of pulmonary function tests.
2. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs (including detailed description of respirations);
 - b. Full lung assessment (including sounds of wheezing, sputum production);
 - c. Level of consciousness;
 - d. Pulse oximetry result;
 - e. Onset, duration, frequency, severity;
 - f. What has been done so far to manage the situation;
 - g. All current medications, any changes plus allergies;
 - h. Precipitating and relieving factors; and
 - i. All current diagnoses.
3. The physician and staff will identify individuals with risk factors for developing COPD or for exacerbation of existing COPD; for example, a history of smoking, environmental or occupational exposure; a family history of COPD or other chronic respiratory diseases; a history of previous complications of, or recurrent hospitalization for complicated respiratory illnesses.
4. The physician and staff will identify individuals with symptoms that suggest undiagnosed COPD or exacerbation of COPD.
 - a. The staff should describe signs and symptoms in sufficient detail; for example, the staff should not just document that someone has “shortness of breath,” which could imply dyspnea (difficult or labored breathing), tachypnea (excessively rapid respirations), or hyperventilation (abnormally prolonged, rapid, shallow breathing associated with decreased pCO₂).
5. Based on an examination and additional testing (as indicated), the physician will identify the presence of COPD and/or clarify its severity.
 - a. Although a physical examination alone cannot diagnose COPD, it may help identify related signs and symptoms as well as the nature and severity of related complications and co-existing conditions.
 - b. Screening tests may include pulse oximetry at rest and with activity, pulmonary function tests, or simple observations such as the 6-minute walk test (how far someone can walk in 6 minutes on flat terrain with a coaching companion) or timing how long it takes someone to expel a full breath after a full inspiration.
 - c. Additional diagnostic or screening tests might include chest x-ray or blood gases.
6. The staff and physician will identify the impact of COPD on an individual’s function and quality of life; for example, activity intolerance, dyspnea on exertion, impaired Activities of Daily Living (ADLs), or anxiety.

continues on next page

7. The physician will identify individuals with complications of COPD; for example, cor pulmonale, arrhythmia or lethargy, or confusion due to hypoxia.

Cause Identification

1. Where the diagnosis of COPD is unclear, the physician will help verify it.
 - a. Chronic obstructive pulmonary disease (COPD) is a chronic, progressive disease characterized by airflow limitation that is not fully reversible.
 - b. COPD is identified by a combination of factors including chronic productive cough that is present daily or intermittently, chronic sputum production, progressive or persistent dyspnea that is worse with exercise or with respiratory infections, and a history of exposure to risk factors such as cigarette smoke and chemicals. COPD symptoms often are non-specific and may mimic those found in other respiratory and cardiac conditions.
 - c. The definitive diagnosis is made via pulmonary function testing (spirometry). COPD is considered to be present if the ratio of FEV1 (forced expiratory volume in 1 second) to forced vital capacity (FVC) [FEV1/FVC ratio] is less than 70 percent after bronchodilator treatment.
2. The physician will help identify factors causing or contributing to COPD and complications in individuals with COPD, or will document why causes could not or should not be identified.

Treatment/Management

1. In conjunction with the staff, resident/patient, and family, the physician will address healthcare treatment issues that may arise in individuals with COPD, including resuscitation or intubation.
2. The staff and physician will also encourage advance care planning in individuals with more advanced or complicated COPD, as with anyone who has a significant irreversible or progressive chronic condition.
3. The physician and staff will identify relevant elements of the care plan; for example, what symptoms to expect (dyspnea, cough, fever, progressive activity intolerance, etc.), how often and what to monitor, when to report findings to the physician, and so on.
4. Key objectives of COPD management include:
 - a. Minimize disease progression;
 - b. Relieve symptoms;
 - c. Improve exercise tolerance;
 - d. Improve or stabilize health status, where possible;
 - e. Prevent and treat exacerbations;
 - f. Prevent and treat complications; and
 - g. Minimize side effects from treatments.
5. The physician and staff will manage COPD, and address causes and exacerbating factors.
 - a. Examples include promoting adequate hydration and nutrition, stabilizing cardiac function, and seeking and addressing causes of anemia.
6. The staff and physician will address individuals who smoke.
 - a. Smoking cessation is a primary preventive measure. To the extent possible, the staff and physician will encourage and help smokers to stop or cut back significantly.
 - b. The facility will strive to maintain the best possible air quality; for example, adequate ventilation systems, appropriate air temperatures, and well maintained central air systems and air filters.

continues on next page

- c. Indoor air pollution may cause or exacerbate symptoms in COPD residents as well as in non-impaired individuals.
7. The staff and physician will identify and address infection risks in individuals with COPD or COPD risk.
 - a. Staff will encourage COPD residents to take the influenza and pneumococcal vaccines.
 - b. During influenza season and respiratory outbreaks, staff will monitor individuals with COPD for onset of respiratory infections.
8. The physician will prescribe treatments for residents with COPD that are consistent with relevant guidelines and protocols; for example, those provided by the Global Initiative for Chronic Lung Disease (GOLD) or American Medical Directors Association (AMDA).
 - a. Medications should be utilized from the following categories in a sequence determined by the clinical situation, including severity and duration of COPD, contraindications, and responses to previous interventions:
 - (1) anticholinergic agent (short-acting PRN or routinely);
 - (2) anticholinergic agent (long-acting routinely);
 - (3) short-acting beta-2 agonist PRN;
 - (4) short-acting beta-2 agonist routinely;
 - (5) long-acting beta-2 agonist;
 - (6) corticosteroids (oral or inhaled); and/or
 - (7) long-acting theophylline.
9. The physician will prescribe ancillary treatments as indicated; for example, supplemental oxygen, diuretics, and antibiotics.
 - a. Supplemental oxygen has been demonstrated to be helpful in treating hypoxia associated with COPD and related conditions such as cor pulmonale and primary pulmonary hypertension. Oxygen therapy during exercise may help increase walking distance and endurance.
 - b. Oxygen may be administered as long-term continuous therapy, during exercise, or to relieve acute dyspnea (for example, nasal-prong oxygen at flow rates of 1-3 liters/minute in stable individuals).
10. The physician and staff will encourage a resident with COPD to improve his/her endurance and exercise tolerance by formulating an individualized exercise and activity program to the extent feasible; for example, breathing exercises, riding a stationary bicycle, or pulmonary rehabilitation.
11. The physician and staff will identify and manage complications of COPD, such as acute infections, hypoxia, polycythemia, heart failure, and acute respiratory failure.
 - a. The physician will identify situations where hospitalization may be indicated; for example, dyspnea with unstable vital signs, fever, and a respiratory rate greater than 28 breaths per minute.
 - b. Respiratory rate and overall clinical status should be considered in addition to pulse oximetry results to gauge the stability of a patient with pulmonary symptoms. Although maintaining oxygen saturation above 90 percent is desirable for the long term, consistently maintaining an oxygen saturation above 90 percent may not be feasible and a low or fluctuating oxygen saturation by itself does not necessarily imply an emergency or the need for hospitalization.
12. The staff and physician will identify and treat acute exacerbations of COPD; for example, recognizing and reporting when an individual with COPD has a change in function or activity tolerance, increased dyspnea, additional sputum production, cough, increasing lethargy or confusion, increased wheezing, increased respiratory or heart rates.
 - a. The physician will review the situation and order appropriate interventions.

continues on next page

Monitoring and Follow-Up

1. The staff and physician will monitor the progress of individuals with COPD, including ongoing evaluation and documentation of signs and symptoms and condition changes.
 - a. The physician and staff will use screening tests such as pulse oximetry appropriately and in accordance with their known limitations. They should be realistic about goals for correcting and maintaining oxygen saturation. Individuals with chronically low oxygen saturation often compensate for hypoxia.
2. The physician will monitor the individual for beneficial and adverse effects (for example, candidal esophagitis, dysphagia, cardiac arrhythmia, restlessness, or insomnia) of medications used to treat COPD.

Pneumonia, Bronchitis and Lower Respiratory Infections – Clinical Protocol

Assessment and Recognition

1. The physician will help identify residents who have recently had pneumonia or bronchitis and those who are at risk for getting respiratory infections (for example, those with COPD or a history of respiratory failure).
2. The staff will identify residents with symptoms that suggest possible bronchitis or pneumonia (for example, dyspnea (at rest and/or on exertion), tachypnea, increased sputum production, fever, chest pain, cough, or hemoptysis).
3. The staff and physician will identify individual risk, such as significant oral or dental disease, presence of a feeding tube, or clinically significant swallowing abnormalities.

Cause Identification

1. The physician will examine the resident and order appropriate diagnostic tests (such as a chest X-ray and complete blood count [CBC]) as indicated to help verify the clinical diagnosis of pneumonia, differentiate causes of respiratory symptoms, and identify the severity of any infection or related complications.
 - a. In general, a routine sputum gram staining and culture are not likely to be useful in either the outpatient or inpatient settings, as many specimens primarily contain oral flora.
 - b. Sputum gram stain and culture might help in cases of suspected drug-resistant bacteria, non-bacterial or atypical infections such as *Mycobacterium tuberculosis*, or organisms not treated by commonly used empiric antibiotic therapy.
 - c. Pulse oximetry may be helpful for residents with respiratory rate >25 breaths/min.
 - d. A chest X-ray may be helpful for residents with suspected or documented pneumonia and hypoxemia (relative to their usual O₂ saturation levels).

Treatment/Management

1. The physician will order appropriate treatment, including antibiotics, as indicated.
 - a. The staff and physician will indicate when limited or no antibiotic treatment may be indicated; for example, because nonbacterial pneumonia is suspected or confirmed, lack of clear indication for antibiotics, or resident/patient or substitute decision-maker choices declining aggressive or potentially life-sustaining medical interventions.
2. The physician and staff will manage significant comorbidities, complications, and risk factors (for example, adjust or temporarily stop diuretics that may impair hydration status, treat concurrent congestive heart failure, or address anemia).
3. The physician will order, and the staff will provide, interventions to support the individual with pneumonia (for example, administer oxygen to treat hypoxia, encourage coughing and deep breathing, provide nebulizer treatments for bronchospasm, etc.).
4. The physician will identify individuals who need hospitalization because of the severity of pneumonia or the presence of complications.

continues on next page

5. Clinical signs suggesting more severe cases may include tachypnea (respiratory rate in the upper 20's/minute) with labored respirations, unstable vital signs, and a substantial and persistent decline in pulse oximetry results of greater than 3 percent from baseline.
6. The staff and physician will identify measures to try to prevent recurrent lower respiratory infections (for example, provide oral healthcare, adjust tube feedings, improve mobility, encourage smoking reduction or cessation, provide influenza and pneumococcal pneumonia vaccination, etc.).

Monitoring

1. The staff and physician will monitor the respiratory status and overall condition of a resident with pneumonia, including complications such as recurrent infection, emphysema, pleural effusion, and respiratory failure.
2. If a resident who has received a course of antibiotics to treat pneumonia or bronchitis has not stabilized or improved as anticipated, the physician will see the resident and evaluate the situation before prescribing a second or subsequent course of antibiotics.

Chest Tube, Caring for a Resident with a

Level III

Purpose

The purpose of this procedure is to provide nursing care of the resident with a chest tube.

Preparation

1. Assess the resident with a chest tube at least every 4 hours, or as ordered.
2. Review the reason for the chest tube to be familiar with the expected amount of drainage and overall condition of the resident.
3. Check the orders to confirm the prescribed amount of suction, if ordered.

Steps in the Procedure

1. Perform hand hygiene.
2. Place bed in semi-Fowler's position.
3. Assess the chest tube insertion site. Ensure dressing is dry and intact and that there is no fluid around the site. There should be no sounds of air leaks from the insertion site.
4. Change dressing every 48 hours for an established chest tube (at least 48-hours post-insertion).
5. Make sure all connections are taped and secured. There should be no kinked, compressed or bent tubing. The drainage system (collection chamber) should be positioned below the level of the chest tube and secured so that it does not tip over.
6. Check the water-seal chamber and ensure that water is at the marked level. Add water if needed. The water should move up and down with respirations (tidaling). Some bubbling is normal. Note the amount of tidaling. If there is no tidaling, notify the physician promptly.
7. Check the suction control dial to ensure it is at the prescribed level. If suction was not ordered, make sure the suction port is open.
8. Assess the level of air leak (internal air level of the resident) via the air leak meter. There should be no bubbling in the air leak meter.
9. Ensure that the clamp is open. Do not clamp a chest tube unless changing the drainage system, checking for air leaks, or if the tube becomes disconnected.
10. Measure the amount of drainage in the collection chamber. Mark date and time on the outside of the chamber.
11. Assist the resident with position change and deep breathing, coughing or spirometry exercises to promote fluid drainage and lung expansion.

Documentation

Document the following in the resident's record.

1. Amount of fluctuation or tidaling in water seal chamber.
2. The amount and characteristic of drainage in the collection chamber (use flow sheet).
3. Condition of the dressing and/or insertion site.
4. Dressing change, if done.
5. Amount of suction, if ordered.
6. Resident's condition and reported level of pain.

continues on next page

Reporting

Notify the physician or practitioner:

1. If there is bubbling inside the air leak meter, which indicates an air leak within the system;
2. Immediately if the chest tube becomes dislodged from the insertion site;
3. If there is drainage that has changed color, or is bloody, or if there is a large increase from the previous measured amount; and/or
4. If the resident is having difficulty breathing or is otherwise in distress.

Version	1.0 (H5MAPR0350)

CPAP/BiPAP Support

Level III

Purpose

1. To provide the spontaneously breathing resident with continuous positive airway pressure with or without supplemental oxygen.
2. To improve arterial oxygenation (PaO₂) in residents with respiratory insufficiency, obstructive sleep apnea, or restrictive/obstructive lung disease.
3. To promote resident comfort and safety.

Preparation

1. Only a qualified and properly trained nurse or respiratory therapist should administer oxygen through a CPAP mask.
2. Review the resident's medical record to determine his/her baseline oxygen saturation or arterial blood gases (ABGs), respiratory, circulatory and gastrointestinal status.
3. Review the physician's order to determine the oxygen concentration and flow, and the PEEP pressure (CPAP, IPAP and EPAP) for the machine.
4. Review and follow manufacturer's instructions for CPAP machine setup and oxygen delivery.
5. Resident should be NPO for at least 2 hours before using a full-face mask.

General Guidelines

1. CPAP (continuous positive airway pressure) and BiPAP (bilevel positive airway pressure) can be used in conjunction with ventilation to improve oxygenation.
2. BiPAP delivers CPAP but allows separate pressure settings for expiration (EPAP) and inspiration (IPAP).
3. CPAP is used when residents have not responded to attempts to increase PaO₂ with other types of oxygen delivery systems (e.g., nasal cannula).
4. CPAP may be appropriate for improving arterial oxygenation in residents with respiratory insufficiency, obstructive sleep apnea, or restrictive/obstructive lung disease.
5. CPAP is generally not appropriate in residents with the following conditions:
 - a. Swallowing difficulties;
 - b. Airway obstruction;
 - c. Unconsciousness, disorientation, or uncooperativeness;
 - d. Hypotension;
 - e. Previous pneumothorax;
 - f. Epistaxis (nose bleeding); and/or
 - g. Bullous lung disease.
6. Side effects associated with CPAP may include:
 - a. Claustrophobia;
 - b. Sleep disturbances;
 - c. Discomfort upon exhaling;
 - d. Headaches;
 - e. Dry mouth;
 - f. Sore throat;

continues on next page

- g. Nosebleeds; and/or
 - h. Gastrointestinal distension.
7. Complications associated with CPAP may include:
- a. Tension pneumothorax;
 - b. Skin breakdown around the mask;
 - c. Aspiration; and/or
 - d. Diminished cardiac output.

Equipment and Supplies

1. NO SMOKING sign for the resident's room;
2. CPAP/BiPAP system (flow generator);
3. Disposable circuit tubing with mask and head strap;
4. Large bore tubing (6 foot);
5. Humidification system;
6. Filter; and
7. Pulse oximeter.

Steps in the Procedure

1. Explain the procedure to the resident. Ask his/her permission to continue.
2. Explain the safety precautions required during oxygen administration (if used).
3. Explain possible side effects of CPAP and instruct to report any discomfort to the nurse.
4. Wash your hands.
5. Connect filter to air flow outlet.
6. Connect one end of the large-bore tubing to the outlet port of the humidifier and the other to the CPAP circuit tubing.
7. Position the exhalation port of the mask away from the resident's face and free from obstruction.
8. Set mode, CPAP, IPAP and EPAP settings on the machine, as prescribed.
9. Attach pulse oximeter to the resident.
10. Holding the mask to the resident's face, turn on the machine and allow him/her to become acclimated to the pressure.
11. Once the resident is acclimated, secure mask on his/her face.
 - a. The mask should fit firmly but does not need to be airtight.
 - b. Placing the mask on too tightly increases the chance of aspiration and skin breakdown.
12. Connect supplemental oxygen (Note: Connect oxygen after the CPAP machine has been turned on and disconnect before it has been turned off.) and adjust flow rate as prescribed.
13. Monitor the oxygen saturation of the resident.

General Guidelines for Cleaning

1. These are general guidelines for cleaning. Specific cleaning instructions are obtained from the manufacturer/supplier of the PAP device.
2. These guidelines are for single-resident use cleaning.
3. Machines must be preprocessed for use between residents by the supplier of the device.
4. **Machine cleaning:** Wipe machine with warm, soapy water and rinse at least once a week and as needed.

continues on next page

5. **Humidifier** (if used):
 - a. Use clean, distilled water only in the humidifier chamber.
 - b. Clean humidifier weekly and air dry.
 - c. To disinfect, place vinegar-water solution (1:3) in clean humidifier. Soak for 30 minutes and rinse thoroughly.
6. **Filter cleaning:**
 - a. Rinse washable filter under running water once a week to remove dust and debris. Replace this filter at least once a year.
 - b. Replace disposable filters monthly.
7. **Masks, nasal pillows and tubing:** Clean daily by placing in warm, soapy water and soaking/agitating for 5 minutes. Mild dish detergent is recommended. Rinse with warm water and allow it to air dry between uses.
8. **Headgear (strap):** Wash with warm water and mild detergent as needed. Allow to air dry.

Documentation

Document the following in the resident's medical record:

1. General assessment (including vital signs, oxygen saturation, respiratory, circulatory and gastrointestinal status) prior to procedure;
2. Time CPAP was started and duration of the therapy;
3. Mode and settings for the CPAP/IPAP/EPAP;
4. Oxygen concentration and flow, if used;
5. How the resident tolerated the procedure; and
6. Oxygen saturation during therapy.

Reporting

1. Notify the physician if the resident refuses the procedure.
2. Notify the physician if the resident experiences any adverse consequences, including (but not limited to) respiratory distress and marked change in vital signs.

Mechanical Ventilation: Setup and Monitoring

Level III

Purpose

The purpose of this procedure is to provide assisted or controlled ventilation to a resident with acute or chronic respiratory insufficiency.

Preparation

1. Verify that there is a physician's order for this procedure. Review the physician's orders, including instructions for:
 - a. Tidal volume;
 - b. Ventilatory rate;
 - c. Peak flow rate;
 - d. Pressure limit;
 - e. Sensitivity;
 - f. Oxygen concentration;
 - g. Mode (assist control or rate control); and
 - h. Special parameters such as positive end expiratory pressure (PEEP) settings.
2. In an emergency, a qualified nurse may initiate mechanical ventilation and then obtain specific orders promptly thereafter.
3. Review the resident's care plan to assess for any special needs of the resident.
4. Assemble the equipment and supplies as needed.
5. Obtain and use the written instructions specific for the ventilator to be used.

General Guidelines

1. Only a qualified nurse or respiratory therapist can initiate mechanical ventilation, based on an appropriate physician order.
2. Long-term ventilator care may be used for residents with neuromuscular disease, spinal cord injury, advanced COPD, or other chronic conditions that affect independent respiratory function.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Mechanical ventilator;
2. Oxygen source;
3. Tracheostomy tube connector;
4. Spirometer or respirometer;
5. Humidification system;
6. Remote ventilator alarm;
7. Oxygen analyzer; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Assessment

While the resident is on mechanical ventilation, assess for the following:

1. Signs and symptoms of hypoxia, including:
 - a. Restlessness;
 - b. Increased pulse rate;
 - c. Increased rate and depth of respirations;
 - d. Diminished lung sounds;
 - e. Cyanosis;
 - f. Fatigue;
 - g. Pallor; and/or
 - h. Confusion.
2. Airway obstruction (suction as indicated);
3. Arterial blood gases or oxygen saturation;
4. Vital signs; and
5. Cardiac rhythm.

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Plug the ventilator into an electrical outlet and connect oxygen and/or air, as appropriate.
3. Check for proper functioning of lights, alarms, filters, fittings, and the humidifier.
4. Start the ventilator following instructions for the ventilator being used.
5. Explain the situation to the resident, if the resident is alert and able to comprehend.
6. Set the ventilator for the various settings established in the physician's order.
7. Listen to the resident's lungs and document breath sounds.
8. Check the ventilator pressure.
9. Connect the ventilator to the resident.
10. Adjust the remote and ventilator alarms so that they can be heard by staff responsible for monitoring the resident.
11. Listen to the resident's lungs for breath sounds. Check for chest wall symmetry during ventilation.
12. Set up suction equipment. Suction the airway as indicated.
13. Document the resident's status and chart all ventilator settings.
14. Discard personal protective equipment in designated receptacles. Wash and dry your hands thoroughly.
15. Reposition the bed covers. Make the resident comfortable.
16. Place the call light within easy reach of the resident.
17. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
18. Review and document the resident's status and ventilator settings at least every 4 hours or as indicated by the resident's condition.

Documentation

After initiating mechanical ventilation, the following information should be recorded in the resident's medical record:

1. The date and time that the procedure was performed.

continues on next page

2. The name and title of the individual who performed the procedure.
3. The mechanical ventilator settings, including:
 - a. Tidal volume;
 - b. Ventilatory rate;
 - c. Peak flow rate;
 - d. Pressure limit;
 - e. Sensitivity;
 - f. Oxygen concentration;
 - g. Mode (assist control or rate control); and
 - h. Special parameters such as positive end expiratory pressure (PEEP) settings.
4. All assessment data obtained before, during, and after the procedure.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR0180)

Oxygen Administration

Level III

Purpose

The purpose of this procedure is to provide guidelines for safe oxygen administration.

Preparation

1. Verify that there is a physician's order for this procedure. Review the physician's orders or facility protocol for oxygen administration.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Oxygen therapy is administered by way of an oxygen mask, nasal cannula, and/or nasal catheter.
 - a. The oxygen mask is a device that fits over the resident's nose and mouth. It is held in place by an elastic band placed around the resident's head.
 - b. The nasal cannula is a tube that is placed approximately one-half inch into the resident's nose. It is held in place by an elastic band placed around the resident's head.
 - c. The nasal catheter is a piece of tubing inserted through the resident's nostrils into the back of his/her mouth. It is held in place by a piece of skin tape attached to the resident's forehead and/or cheek.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Portable oxygen cylinder (strapped to the stand);
2. Nasal cannula, nasal catheter, mask (as ordered);
3. Humidifier bottle;
4. "No Smoking/Oxygen in Use" signs;
5. Regulator; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Assessment

Before administering oxygen, and while the resident is receiving oxygen therapy, assess for the following:

1. Signs or symptoms of cyanosis (i.e., blue tone to the skin and mucous membranes);
2. Signs or symptoms of hypoxia (i.e., rapid breathing, rapid pulse rate, restlessness, confusion);
3. Signs or symptoms of oxygen toxicity (i.e., tracheal irritation, difficulty breathing, or slow, shallow rate of breathing);
4. Vital signs;
5. Lung sounds;
6. Arterial blood gases and oxygen saturation, if applicable; and
7. Other laboratory results (hemoglobin, hematocrit, and complete blood count), if applicable.

continues on next page

Steps in the Procedure

1. Wash and dry your hands thoroughly.
2. Place an “Oxygen in Use” sign on the outside of the room entrance door. Close the door.
3. Place an “Oxygen in Use” sign in a designated place on or over the resident’s bed.
4. Remove all potentially flammable items (e.g., lotions, oils, alcohol, smoking articles, etc.) from the immediate area where the oxygen is to be administered.
5. Unless otherwise instructed, unplug and/or relocate all electrical devices (e.g., radios, televisions, electric shavers, etc.) in the immediate area where oxygen is to be administered.
6. Remove any woolen blankets, nylon and/or rayon clothing, etc., from the immediate area where oxygen is to be administered.
7. Check the tubing connected to the oxygen cylinder to assure that it is free of kinks.
8. Turn on the oxygen. Unless otherwise ordered, start the flow of oxygen at the rate of 2 to 3 liters per minute.
9. Place appropriate oxygen device on the resident (i.e., mask, nasal cannula and/or nasal catheter).
10. Adjust the oxygen delivery device so that it is comfortable for the resident and the proper flow of oxygen is being administered.
11. Securely anchor the tubing so that it does not rub or irritate the resident’s nose, behind the resident’s ears, etc.
12. Check the mask, tank, humidifying jar, etc., to be sure they are in good working order and are securely fastened. Be sure there is water in the humidifying jar and that the water level is high enough that the water bubbles as oxygen flows through.
13. Observe the resident upon setup and periodically thereafter to be sure oxygen is being tolerated (see “Assessment”).
14. Periodically re-check water level in humidifying jar.
15. Discard used supplies into designated containers.
16. Discard personal protective equipment in designated receptacles. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
20. Instruct the resident, his/her family, visitors and roommate (if any) of the oxygen safety precautions. Provide the resident with a written copy of the *Oxygen Safety* handout.
21. Wash and dry your hands thoroughly.

Documentation

After completing the oxygen setup or adjustment, the following information should be recorded in the resident’s medical record:

1. The date and time that the procedure was performed.
2. The name and title of the individual who performed the procedure.
3. The rate of oxygen flow, route, and rationale.
4. The frequency and duration of the treatment.
5. The reason for p.r.n. administration.
6. All assessment data obtained before, during, and after the procedure.
7. How the resident tolerated the procedure.

continues on next page

8. If the resident refused the procedure, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR0207)

Pulse Oximetry (Assessing Oxygen Saturation)

Level III

Purpose

The purpose of this procedure is to monitor arterial blood oxygen saturation (SaO₂) without the use of invasive devices.

Preparation

1. Review the physician's orders or facility protocol for pulse oximetry.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Refer to the manufacturer's instructions for pulse oximetry placement and alarm settings.
4. Assemble the equipment and supplies as needed.

General Guidelines

1. The pulse oximeter is a probe with light emitting diodes (LEDs) connected to an oximeter. The LED emits light waves that are absorbed by oxygenated and deoxygenated hemoglobin molecules. The oximeter measures the light reflected by these molecules and calculates the pulse oxygen saturation (SpO₂), which is a reliable measure of SaO₂. Several factors can influence the accuracy of pulse oximetry, such as:
 - a. **Amount of hemoglobin.** The pulse oximeter measures oxygen saturation of the hemoglobin, not absolute hemoglobin levels. Therefore, a severely anemic resident could have normal SaO₂ without maintaining adequate oxygen in the tissues.
 - b. **Placement of the oximeter.** Impaired circulation (e.g., peripheral vascular disease, temperature-induced vasoconstriction) to the area in which the oximeter probe is placed will provide inaccurate data. Since the elderly often have impaired peripheral circulation, the probe should be placed on the ear or bridge of the nose.
 - c. **Activity.** Movement of the probe may affect the oximeter readings. Do not place probe on the finger of a resident who experiences hand tremors.
 - d. **Light.** Bright lights (sunlight, treatment lights, etc.) may interfere with accuracy of the SpO₂ readings.
 - e. **Foreign objects.** Artificial nails and nail polish can prevent the LEDs from reaching the saturated hemoglobin molecules, lowering the SpO₂ readings.
2. Normally SpO₂ is between 90 and 100 percent; SpO₂ below 70 percent is life threatening.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Pulse oximeter;
2. Appropriate probe;
3. Nail polish remover;
4. Flow chart or documentation record; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Assessment

1. Assess the resident for the following signs and symptoms of impaired oxygen saturation:
 - a. Altered respirations, difficulty breathing, abnormal breath sounds;

continues on next page

- b. Cyanotic appearance of nail beds, lips, skin, mucous membranes, skin;
 - c. Restlessness, irritability; and/or
 - d. Confusion, loss of consciousness.
2. Assess the site most appropriate for probe placement:
 - a. If the resident has impaired peripheral circulation or hand tremors, place the probe on the ear or bridge of the nose.
 - b. If the resident is obese, use a disposable, adhesive probe.
 - c. Do not attach clip-on probe if area is edematous or skin integrity is compromised.
 3. Assess the resident for latex allergy. If the resident is allergic to latex, do not use adhesive probes.

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. Perform hand antisepsis.
4. Assist the resident to a comfortable, resting position.
5. If placing probe on finger, support the resident's lower arm. Remove fingernail polish.
6. Attach probe to selected site and probe cable to monitor.
7. Turn on oximeter.
8. Compare oximeter pulse rate with resident's radial or apical pulse (they should be the same).
9. **For intermittent monitoring:**
 - a. Wait until oximeter displays a constant SpO₂ value and pulse display reaches its maximum for every cardiac cycle. Record SpO₂ on readout.
10. For continuous monitoring:
 - a. Check alarm limits and volume. Reset to desired levels.
 - b. Verify that alarms are activated.
 - c. Assess skin integrity under probe regularly.
 - d. Reposition probe regularly.
11. If SpO₂ is less than 90 percent:
 - a. Reposition the probe and re-evaluate readings.
 - b. If SaO₂ is less than acceptable level for resident's condition, notify the physician.
 - c. Position the resident in semi or high-Fowler's position.
12. If pulse wave intensity is low:
 - a. Locate different site for probe and reposition.
 - b. Use a different probe.
 - c. Assess cardiovascular status by assessing radial and apical pulses.
13. Remove probe when monitoring is complete. Turn off monitor.
14. Discard all disposable items in designated receptacles.
15. Discard personal protective equipment (if used) in designated receptacles.
16. Perform hand antisepsis.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

continues on next page

Documentation

The SaO2 flow sheet should be placed in the medical record. In addition, the following information should be recorded in the resident’s medical record:

1. The date and time that the procedure was performed.
2. The type of probe and location of placement.
3. The assessment data gathered prior to the procedure.
4. The resident’s response to the procedure.
5. Any unusual findings and action taken.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person performing the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR0227)

Suctioning the Lower Airway (Endotracheal [ET] or Tracheostomy Tube)

Level III

Purpose

The purpose of this procedure is to remove secretions, maintain a patent airway, and prevent infection of the lower respiratory tract.

Preparation

1. Verify that there is a physician's order for this procedure. Review the physician's orders or facility protocol for suctioning.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Obtain baseline vital signs and oxygen saturation from the resident's medical record.
4. Obtain information about the resident's medical history, including date of intubation (tracheostomy), respiratory signs and symptoms, and risk factors for increased secretions, decreased airway clearance and/or airway obstruction (i.e., Chronic Obstructive Pulmonary Disease [COPD], chest trauma, abdominal surgery, and smoking).
5. Assemble the equipment and supplies as needed.
6. Test equipment before use. Determine if suction equipment is generating appropriate negative pressure. Use lower negative pressure with older residents whose oral mucosa is fragile.
 - a. Wall suction units should be set between 100-120 mm Hg.
 - b. Portable suction devices should have negative pressure set at 10-15 mmHg.

General Guidelines

1. Complications of suctioning the lower airway include trauma to the airway, infection, hypoxia, hypoxemia, and cardiac dysrhythmias (resulting from hypoxemia). To minimize the risk of complications, apply the following guidelines:
 - a. Suction only as needed, based on assessment of the resident's level of respiratory distress;
 - b. Use sterile equipment to avoid widespread pulmonary and systemic infection (Note: Suctioning of the lower airway is a sterile procedure. All equipment that comes in contact with the lower airway must be sterile.);
 - c. Hyperinflate the resident with a manual resuscitation (Ambu) bag (as ordered) before and after suctioning; and
 - d. Hyperoxygenate the resident by increasing the oxygen flow (as ordered) before the procedure and between suctioning. (Note: After the procedure, oxygen should be readjusted as ordered to prevent oxygen toxicity and increased CO₂ in COPD residents.)
2. Monitor the resident's pulse and oxygen saturation (see procedure entitled *Pulse Oximetry*) during suctioning. If pulse decreases more than 20 beats per minute (BPM) or increases more than 40 BPM, or oxygen saturation drops below 90 percent (or 5 percent from baseline) discontinue suctioning and re-ventilate and re-oxygenate the resident.

continues on next page

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Sterile suction catheter kit;
2. Sterile drape;
3. Sterile cup;
4. Sterile gloves;
5. #10 to #16 French catheter (catheter outer diameter should not exceed one-half the internal diameter of the tube);
6. Sterile gauze;
7. Towel or Chux pad;
8. 100 cc sterile saline or sterile water;
9. Resuscitation (Ambu) bag with supplemental oxygen;
10. Wall or portable unit;
11. Tubing (approximately 6 feet); and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Assessment

1. Identify the following risk factors for impaired airway clearance or aspiration:
 - a. Impaired cough or gag reflex;
 - b. Dysphagia;
 - c. Weak respiratory muscles (from injury, abdominal surgery, etc.);
 - d. COPD;
 - e. Pulmonary infection;
 - f. Presence of feeding tube;
 - g. Smoking; and/or
 - h. Decreased level of consciousness.
2. Assess for the following signs and symptoms of respiratory distress/hypoxia/ hypoxemia:
 - a. Diminished breath sounds;
 - b. Tachypnea;
 - c. Dyspnea;
 - d. Gurgling, crackling or wheezing upon inspiration;
 - e. Cyanosis;
 - f. Decreased oxygen saturation (SpO₂);
 - g. Restlessness; and/or
 - h. Drooling, secretions or vomitus in mouth.

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. Perform hand antisepsis.
4. Put on gloves.
5. Put on mask and protective eyewear (goggles or face shield), as indicated.

continues on next page

6. Assist the resident to semi-Fowler's position with head turned toward you. If the resident is unconscious, place in lateral position facing you.
7. Connect one end of suction tubing to suction unit and place the other end near the resident.
8. Turn on suction unit and adjust to appropriate negative pressure (100-120 mmHg for wall unit or 10-15 mmHg for portable unit).
9. Remove gloves.
10. Open suction catheter kit.
11. Place sterile drape across the resident's chest.
12. Remove sterile cup, touching only the outside.
13. Fill cup with 100 cc sterile saline or sterile water.
14. Apply sterile gloves. *The dominant hand will remain sterile.*
15. Holding the catheter in dominant hand and the tubing in the non-dominant hand, connect the catheter to the tubing.
16. Suction a small amount of water from the cup to verify negative pressure. Rest catheter tip on sterile surface (e.g., sterile drape or open catheter kit).
17. Remove oxygen or humidity delivery device using non-dominant hand.
18. Hyperinflate and hyperoxygenate the resident using an Ambu bag connected to supplemental oxygen.
19. Manually ventilate ("bag") the resident 4 to 5 times, coordinating with natural breaths. Remove bag.
20. Instruct the resident to inhale.
21. Upon inhalation, insert the catheter into airway (ET tube or tracheostomy tube) *without applying suction*. Advance the catheter until resistance is met and/or resident coughs (at the carina). Pull back 1 to 2 cm.
22. Apply intermittent suction and slowly withdraw catheter while rotating between thumb and forefinger. Limit suction time to no more than 10 seconds.
23. Re-ventilate and oxygenate the resident for a minimum of one minute between suction passes.
24. Rinse catheter and tubing with sterile saline or sterile water until clear.
25. Assess cardio-pulmonary status.
26. Repeat steps 20 through 24, if necessary. Limit suction passes to a maximum of three.
27. Suction the oral or nasal cavity. (Note: Oropharyngeal and nasopharyngeal suctioning contaminate the catheter. Do not re-insert catheter into ET or tracheostomy tube.)
28. Replace oxygen or humidity delivery device.
29. If the resident's physical or medical condition permits, assist the resident to a position that promotes deep breathing and coughing.
30. Turn off suction.
31. Disconnect catheter from tubing. Wrap catheter around gloved hand. Pull the glove off and over the catheter. Discard in designated receptacle.
32. Remove drape and discard in designated receptacle.
33. Discard water or saline in commode. Dispose of cup in designated receptacle.
34. Empty and rinse collection container if necessary or as indicated by facility protocol.
35. Discard personal protective equipment in designated receptacles. Wash and dry your hands thoroughly.
36. Apply clean gloves and provide oral hygiene for the comfort of the resident, if indicated.
37. Perform hand antisepsis.
38. Reposition the bed covers. Make the resident comfortable.
39. Place the call light within easy reach of the resident.
40. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time that the procedure was performed.
2. The type and size of catheter used.
3. Amount of negative pressure (mmHg) used to suction.
4. Amount, color and characteristics of secretions (color, odor, thickness, etc.).
5. The resident’s response to the procedure.
6. Cardio-pulmonary status, including lung sounds, during the procedure.
7. Assessment data before and after the procedure.
8. If the resident refused the treatment, the reason(s) why and the intervention taken.
9. The signature and title of the person performing the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR 0265)

Suctioning the Upper Airway (Nasal Pharyngeal Suctioning)

Level III

Purpose

The purpose of this procedure is to clear the upper airway of mucous secretions and prevent the development of respiratory distress.

Preparation

1. Verify that there is a physician's order for this procedure. Review the physician's orders or facility protocol for suctioning.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Obtain baseline vital signs and oxygen saturation from the resident's medical record.
4. Assemble the equipment and supplies as needed.
5. Test equipment before use. Determine if suction equipment is generating appropriate negative pressure. Use lower negative pressure with older residents whose oral mucosa is fragile.
 - a. Wall suction units should be set between 100-120 mm Hg.
 - b. Portable suction devices should have negative pressure set at 10-15 mmHg.

General Guidelines

1. Use the nasal route to suction the pharynx whenever practical. Suctioning from the mouth increases the introduction of bacteria into the airway.
2. Older clients are more susceptible to aspiration of secretions because of weakened cough and gag reflexes.
3. Do not routinely suction. Suctioning irritates the mucous membranes and can increase secretions if performed too frequently. Type and frequency of suctioning is based on assessment of resident's respiratory distress.
4. *Nasopharyngeal suctioning is performed using sterile technique. Catheters should not be reused.*
5. Monitor the resident's pulse and oxygen saturation (see procedure entitled *Pulse Oximetry*) during suctioning. If pulse decreases more than 20 beats per minute (BPM) or increases more than 40 BPM, or oxygen saturation drops below 90 percent (or 5 percent from baseline) discontinue suctioning and re-ventilate and re-oxygenate the resident.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Sterile suctioning kit; *
2. 100 cc sterile saline or sterile water;
3. Sterile drape;
4. Sterile cup;
5. Sterile gloves;
6. Curve-tipped #10 to #16 French catheter; with suction control port or adapter;
7. Water-soluble lubricant;
8. Sterile gauze;
9. Tubing (approximately 6 feet); and

continues on next page

10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

*Most of the equipment/supplies listed above are contained in the sterile suctioning kit. However, they are listed individually because there may be times when you will need to obtain and assemble such supplies without the benefit of a kit.

Assessment

1. Identify the following risk factors for impaired airway clearance or aspiration:
 - a. Impaired cough or gag reflex;
 - b. Dysphagia;
 - c. Weak respiratory muscles (from injury, abdominal surgery, etc.);
 - d. COPD;
 - e. Smoking; and/or
 - f. Decreased level of consciousness.
2. Assess for the following signs and symptoms of respiratory distress:
 - a. Dyspnea;
 - b. Gurgling or rattling breath sounds;
 - c. Cyanosis;
 - d. Decreased oxygen saturation (SpO₂);
 - e. Restlessness; and/or
 - f. Obvious secretions or vomitus in mouth.

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. Perform hand antisepsis.
4. Put on gloves.
5. Put on mask and protective eyewear (goggles or face shield), as indicated.
6. Assist the resident to semi-Fowler's position with head turned toward you. If the resident is unconscious, place in lateral position facing you.
7. Place towel or Chux pad under the chin.
8. Turn on suction unit and adjust to appropriate negative pressure (100-120 mmHg for wall unit or 10-15 mmHg for portable unit).
9. Verify that suction tubing is attached to wall or portable unit.
10. Open the sterile suction kit.
11. Place sterile drape across the resident's chest.
12. With (clean) gloved hand, remove the cup touching only the outside edge.
13. Fill cup with 100 cc sterile saline or sterile water.
14. Open the water-soluble lubricant. Squeeze contents onto sterile place in suction kit.
15. Put on sterile gloves. *The dominant hand will remain sterile.*
16. Pick up the catheter with sterile hand and attach to the suction tubing (held in non-sterile hand).
17. Test equipment by suctioning a small amount of sterile saline or water from the cup.
18. Measure the depth of catheter insertion by estimating the distance between the tip of the nose and the earlobe. Mark the position on the catheter with the sterile hand.
19. Lubricate 2-3 inches of the distal end of the catheter.

continues on next page

20. Instruct the resident to inhale.
21. Upon the resident's inhalation, insert the catheter into either nostril **without applying suction**. Advance the catheter the estimated distance to the pharynx, staying on the floor of the nasal cavity. Pull back 1-2 cm if resistance is met.
22. Apply intermittent suction and slowly withdraw catheter while rotating between thumb and forefinger. Limit suction time to no more than 10 seconds.
23. Wipe the outside of the catheter with sterile gauze.
24. Suction sterile water to flush the catheter and tubing.
25. Assess the respiratory status of the resident and effectiveness of procedure.
26. Lubricate the catheter and repeat procedure in opposite nostril, if necessary. (Note: Suction at 20-30 second intervals and for no longer than 5 minutes total.)
27. Encourage the resident to cough and deep breathe between suction.
28. If the resident's physical or medical condition permits, assist the resident to a position that promotes deep breathing and coughing.
29. Turn off suction.
30. Disconnect catheter from tubing. Wrap catheter around gloved hand. Pull the glove off and over the catheter. Discard in designated receptacle.
31. Remove drape and discard in designated receptacle.
32. Discard water or saline in commode. Dispose of cup in designated receptacle.
33. Empty and rinse collection container if necessary or as indicated by facility protocol.
34. Discard personal protective equipment in designated receptacles. Wash and dry your hands thoroughly.
35. Apply clean gloves and provide oral hygiene for the comfort of the resident, if indicated.
36. Perform hand antisepsis.
37. Reposition the bed covers. Make the resident comfortable.
38. Place the call light within easy reach of the resident.
39. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the procedure was performed.
2. The type and size of catheter used.
3. Amount of negative pressure (mmHg) used to suction.
4. Amount, color and characteristics of secretions (color, odor, thickness, etc.).
5. The resident's response to the procedure.
6. Cardio-pulmonary status, including lung sounds, during the procedure.
7. Assessment data before and after the procedure.
8. If the resident refused the treatment, the reason(s) why and the intervention taken.
9. The signature and title of the person performing the procedure.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Suctioning the Upper Airway (Oral Pharyngeal Suctioning) Level III

Purpose

The purpose of this procedure is to clear the upper airway of mucous secretions and prevent the development of respiratory distress.

Preparation

1. Verify that there is a physician's order for this procedure. Review the physician's orders or facility protocol for suctioning.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Obtain baseline vital signs and oxygen saturation from the resident's medical record.
4. Assemble the equipment and supplies as needed.
5. Test equipment before use. Determine if suction equipment is generating appropriate negative pressure. Use lower negative pressure with older residents whose oral mucosa is fragile.
 - a. Wall suction units should be set between 100-120 mm Hg.
 - b. Portable suction devices should have negative pressure set at 10-15 mmHg.

General Guidelines

1. Use the nasal route to suction the pharynx whenever practical. Suctioning from the mouth increases the introduction of bacteria into the airway.
2. Older clients are more susceptible to aspiration of secretions because of weakened cough and gag reflexes.
3. Do not routinely suction. Suctioning irritates the mucous membranes and can increase secretions if performed too frequently. Type and frequency of suctioning is based on assessment of resident's respiratory distress.
4. Residents with dysphagia (impaired swallowing) may benefit from suctioning before, during and after meals.
5. Oropharyngeal suctioning is performed using clean technique.
6. Monitor the resident's vital signs during the procedure. Discontinue and notify physician if resident shows signs of distress.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Towel or Chux pad;
2. 100 cc saline or water;
3. Disposable cup or non-sterile basin;
4. *Yankauer* or open-tipped catheter (if secretions are thick and copious) or curve-tipped #10 to #16 French catheter with suction control port or adapter;
5. Sterile gauze;
6. Tubing (approximately 6 feet); and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Assessment

1. Identify the following risk factors for impaired airway clearance or aspiration:
 - a. Impaired cough or gag reflex;
 - b. Dysphagia;
 - c. Weak respiratory muscles (from injury, abdominal surgery, etc.);
 - d. COPD;
 - e. Smoking; and/or
 - f. Decreased level of consciousness.
2. Assess for the following signs and symptoms of respiratory distress:
 - a. Dyspnea;
 - b. Gurgling or rattling breath sounds;
 - c. Cyanosis;
 - d. Decreased oxygen saturation (SpO₂);
 - e. Restlessness; and/or
 - f. Obvious secretions or vomitus in mouth.

Steps in the Procedure

1. Provide for resident privacy.
2. Explain the procedure to the resident.
3. Perform hand antisepsis.
4. Put on gloves.
5. Put on mask and protective eyewear (goggles or face shield), as indicated.
6. Assist the resident to semi-Fowler's position with head turned toward you. If the resident is unconscious, place in lateral position facing you.
7. Place towel or Chux pad under the chin.
8. Turn on suction unit and set to appropriate negative pressure (100-120 mmHg for wall unit or 10-15 mmHg for portable unit).
9. Fill cup or basin with approximately 100 cc water.
10. Verify that suction tubing is attached to wall or portable unit.
11. Attach catheter to tubing.
12. Suction a small amount of water from the basin (by placing finger on the port) to verify negative pressure.
13. Remove oxygen mask from resident, if necessary. (Note: Do not remove nasal cannula if only suctioning from the mouth.)
14. Pull the tongue forward, if needed, using sterile gauze.
15. Advance the catheter into the mouth approximately 4 to 6 inches along the gumline.
16. Staying along the gumline, apply suction until secretions are cleared.
17. Replace oxygen mask.
18. Clear catheter and tubing of secretions by suctioning water from the basin.
19. Assess the respiratory status of the resident and effectiveness of procedure.
20. Repeat procedure, if necessary.
21. If the resident's physical or medical condition permits, assist the resident to a position that promotes deep breathing and coughing.
22. Turn off suction.

continues on next page

23. Remove towel or Chux pad and place in designated receptacle.
24. Discard water or saline in commode. Dispose of cup in designated receptacle.
25. Rinse basin with warm, soapy water.
26. Empty and rinse collection container if necessary or as indicated by facility protocol.
27. Place catheter in clean, dry area.
28. Discard personal protective equipment in designated receptacles. Wash and dry your hands thoroughly.
29. Apply clean gloves and provide oral hygiene for the comfort of the resident, if indicated.
30. Reposition the bed covers. Make the resident comfortable.
31. Place the call light within easy reach of the resident.
32. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that the procedure was performed.
2. The type and size of catheter used.
3. Amount of negative pressure (mmHg) used to suction.
4. Amount, color and characteristics of secretions (color, odor, thickness, etc.).
5. The resident's response to the procedure.
6. Cardio-pulmonary status, including lung sounds, during the procedure.
7. Assessment data before and after the procedure.
8. If the resident refused the treatment, the reason(s) why and the intervention taken.
9. The signature and title of the person performing the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Tracheostomy Care

Level III

Purpose

The purpose of this procedure is to guide tracheostomy care and the cleaning of reusable tracheostomy cannulas.

Equipment and Supplies

1. Gloves (clean and sterile);
2. Mask and eyewear (as indicated);
3. Tracheostomy care kit;
4. Hydrogen peroxide;
5. Sterile water or normal saline;
6. Suction catheter;
7. Suction machine;
8. Pulse oximeter; and
9. Extra gauze dressing.

General Guidelines

1. Aseptic technique must be used:
 - a. During cleaning and sterilization of reusable tracheostomy tubes;
 - b. During all dressing changes until the tracheostomy wound has granulated (healed); and
 - c. During tracheostomy tube changes, either reusable or disposable.
2. Gloves must be used on both hands during any or all manipulation of the tracheostomy. Sterile gloves must be used during aseptic procedures.
3. A mask and eyewear must be worn if splashes, spattering, or spraying of blood or body fluids is likely to occur when performing this procedure.
4. Tracheostomy tubes should be changed as ordered and as needed (at least monthly).
5. Tracheostomy care should be provided as often as needed, at least once daily for old, established tracheostomies, and at least every eight hours for residents with unhealed tracheostomies.
6. A replacement tracheostomy tube must be available at the bedside at all times.
7. A suction machine, supply of suction catheters, exam and sterile gloves, and flush solution, must be available at the bedside at all times.

Procedure Guidelines

Preparation and Assessment

1. Check physician order.
2. Explain procedure to resident.
3. Wash hands.
4. Put exam gloves on both hands.
5. Remove supplemental oxygen mask from tracheostomy.
6. Inspect skin and stoma site for signs or symptoms of infection, leakage, subcutaneous crepitus, or dislodged tube.

continues on next page

7. Assess resident for respiratory distress.
 - a. Measure resident's oxygen saturation with pulse oximeter.
 - b. Listen to lung sounds with a stethoscope.
 - c. Observe for asymmetrical chest expansion.
8. Remove old dressings. Pull soiled glove over dressing and discard into appropriate receptacle.
9. Wash hands.

Clean the Removable Inner Cannula

1. Open tracheostomy cleaning kit.
2. Set up supplies on sterile field.
3. Maintaining sterile field, pour equal parts hydrogen peroxide and normal saline in one compartment of opened kit. Pour normal saline in another compartment.
4. Open four gauze pads and saturate with hydrogen peroxide.
5. Open two gauze pads and saturate with antiseptic solution.
6. Open two gauze pads and saturate with sterile saline.
7. Open two gauze pads; keep them dry.
8. Put on sterile gloves.
9. Secure the outer neck plate with non-dominant gloved hand.
10. Unlock the inner cannula with gloved dominant hand.
11. Gently remove the inner cannula, rotating counterclockwise while lifting away from the resident.
12. Soak the cannula in hydrogen peroxide/saline mixture.
13. Clean with brush. Rinse with saline and dry with pipe cleaners.
14. Remove and discard gloves into appropriate receptacle.
15. Wash hands and put on fresh gloves.
16. Replace the cannula carefully and lock in place.
17. Ensure there is an emergency tracheostomy set up at resident's bedside.

Site and Stoma Care:

1. Apply clean gloves.
2. Clean the stoma with two peroxide-soaked gauze pads (using a single sweep for each side).
3. Rinse the stoma with saline-soaked gauze pads (using a single sweep for each side).
4. Wipe with dry gauze (using a single sweep for each side).
5. Disinfect the stoma with the antiseptic-soaked gauze pads (using a single sweep for each side). Allow to air dry or wipe with clean, dry gauze.
6. Remove neck ties and replace with clean ones.
 - a. If the resident's condition is unstable, or if the stoma is less than two weeks old, apply new ties before removing old ones.
7. Apply a fenestrated gauze pad around the insertion site.
8. Replace supplemental oxygen mask over tracheostomy.
9. Remove gloves and discard into appropriate receptacle.
10. Wash hands.
11. Document the procedure, condition of the site, and the resident's response.

Pressure Ulcers/Skin Breakdown – Clinical Protocol

Assessment and Recognition

1. The nursing staff and practitioner will assess and document an individual's significant risk factors for developing pressure ulcers; for example, immobility, recent weight loss, and a history of pressure ulcer(s).
2. In addition, the nurse shall describe and document/report the following:
 - a. Full assessment of pressure sore including location, stage, length, width and depth, presence of exudates or necrotic tissue;
 - b. Pain assessment;
 - c. Resident's mobility status;
 - d. Current treatments, including support surfaces; and
 - e. All active diagnoses.
3. The staff and practitioner will examine the skin of newly admitted residents for evidence of existing pressure ulcers or other skin conditions.
4. The physician will assist the staff to identify the type (for example, arterial or stasis ulcer) and characteristics (presence of necrotic tissue, status of wound bed, etc.) of an ulcer.
5. The physician will help identify and define any complications related to pressure ulcers.

Cause Identification

1. The physician will help identify factors contributing or predisposing residents to skin breakdown; for example, medical comorbidities such as diabetes or congestive heart failure, overall medical instability, cancer or sepsis causing a catabolic state, and macerated or friable skin.
2. The physician will clarify the status of relevant medical issues; for example, whether there is a soft tissue infection or just wound colonization, whether the wound has necrotic tissue, and the impact of comorbid conditions on healing an existing wound.

Treatment/Management

1. The physician will order pertinent wound treatments, including pressure reduction surfaces, wound cleansing and debridement approaches, dressings (occlusive, absorptive, etc.), and application of topical agents.
2. The physician will help identify medical interventions related to wound management; for example, treating a soft tissue infection surrounding an ulcer, removing necrotic tissue, addressing comorbid medical conditions, managing pain related to the wound or to wound treatment, etc.
 - a. Although poor nutritional status is associated with increased risk of pressure ulcer development, no specific nutritional interventions clearly prevent or heal pressure ulcers.
 - b. Beyond trying to maintain a stable weight and providing approximately 1.2-1.5 gm/kg protein daily, there are no routine pressure ulcer-specific nutritional measures for those with or at risk for developing a pressure ulcer.
 - c. Any nutritional supplementation should be based on realistic appraisal of an individual's current nutritional status and minimizing any medications and conditions that may be affecting appetite and weight.

continues on next page

3. The physician will help staff characterize the likelihood of wound healing, based on a review of pertinent factors; for example:
 - a. Healing or Prevention Likely: The resident's underlying physical condition, prognosis, personal goals and wishes, care instructions, and ability to cooperate with the treatment plan make wound healing and subsequent wound prevention realistic.
 - b. Healing or Prevention Possible: Healing may be delayed or may occur only partially; wounds may occur despite appropriate preventive efforts.
 - c. Healing or Prevention Unlikely: The resident is likely to decline or die because of his/her overall medical instability; wounds reflect the individual's overall medical instability; an existing wound is unlikely to improve significantly; additional wounds are likely to occur despite preventive efforts.
4. As needed, the physician will help identify medical and ethical issues influencing wound healing; for example, the impact of end-stage heart disease or because the resident or family declines artificial nutrition and hydration.
 - a. Advance directives may limit the scope, intensity, duration, and selection of various wound-related or adjunctive treatments such as a choice to forego artificial nutrition and hydration.

Monitoring

1. During resident visits, the physician will evaluate and document the progress of wound healing—especially for those with complicated, extensive, or poorly-healing wounds.
2. The physician will guide the care plan as appropriate, especially when wounds are not healing as anticipated or new wounds develop despite existing interventions.
 - a. Healing may be delayed or may not occur, or additional ulcers may occur because of other factors which cannot be modified.
 - b. Current approaches should be reviewed for whether they remain pertinent to the resident/patient's medical conditions, are affected by factors influencing wound development or healing, and the impact of specific treatment choices made by the resident/patient or a substitute decision-maker.

Dressings, Soiled/Contaminated

Policy Statement

All soiled/contaminated dressings must be handled in a safe and sanitary manner and must be incinerated or disposed of following decontamination or containment.

Policy Interpretation and Implementation

1. Disposable items such as bandages, applicators, gauze pads, etc., that are soiled or contaminated with infective material, blood, or body fluids must be placed in a plastic bag and removed from the resident's room upon completion of any procedure.
2. Soiled dressings that are not heavily soiled with exudate may be placed in a plastic bag and placed in regular waste.
3. Soiled dressings that are heavily soiled with exudate or drainage or from a resident with an infectious condition must be placed in specially designated "**BIOHAZARD**" containers for disposal.
4. Gloves must be worn when changing a dressing and/or when handling items contaminated with blood, body fluids, or potentially infective materials.
5. Follow established procedures governing wound care.

Dressings, Dry/Clean

Level III

Purpose

The purpose of this procedure is to provide guidelines for the application of dry, clean dressings.

Preparation

1. Verify that there is a physician's order for this procedure. (Note: This may be generated from a facility protocol.)
2. Review the resident's care plan, current orders, and diagnoses to determine if there are special resident needs.
3. Check the treatment record.
4. Assemble the equipment and supplies as needed. Date and initial all bottles and jars upon opening (unless product is single use). Wipe nozzles of wound with alcohol pledget or facility disinfectant wipe. (Note: This may be performed at the treatment cart.)
5. Explain procedure to the resident and provide privacy.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Clean dressing(s);
2. Cleaning solution, as ordered;
3. Tape;
4. Scissors; and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Clean bedside stand. Establish a clean field.
2. Place the clean equipment on the clean field. Arrange the supplies so they can be easily reached.
3. Tape a biohazard or plastic bag on the bedside stand or use a waste basket below clean field.
4. Position resident and adjust clothing to provide access to affected area.
5. Wash and dry your hands thoroughly.
6. Put on clean gloves. Loosen tape and remove soiled dressing.
7. Pull glove over dressing and discard into plastic or biohazard bag.
8. Wash and dry your hands thoroughly.
9. Open dry, clean dressing(s) by pulling corners of the exterior wrapping outward, touching only the exterior surface.
10. Label tape or dressing with date, time and initials. Place on clean field.
11. Using clean technique, open other products (i.e., prescribed dressing; dry, clean gauze).
12. Wash and dry your hands thoroughly.
13. Put on clean gloves.
14. Assess the wound and surrounding skin for edema, redness, drainage, tissue healing progress and wound stage.

continues on next page

15. Cleanse the wound with ordered cleanser. If using gauze, use clean gauze for each cleansing stroke. Clean from the least contaminated area to the most contaminated area (usually, from the center outward).
16. Use dry gauze to pat the wound dry.
17. Apply the ordered dressing and secure with tape or bordered dressing per order. (Note: Use non-allergenic tape as indicated.) Label with date and initials to top of dressing.
18. Discard disposable items into the designated container.
19. Remove disposable gloves and discard into designated container. Wash and dry your hands thoroughly.
20. Reposition the bed covers. Make the resident comfortable.
21. Place the call light within easy reach of the resident.
22. Clean the bedside stand.
23. Wash and dry your hands thoroughly.
24. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record, treatment sheet or designated wound form:

1. The date and time the dressing was changed.
2. Wound appearance, including wound bed, edges, presence of drainage.
3. The name and title (or initials) of the individual changing the dressing.
4. The type of dressing used and wound care given.
5. All assessment data (i.e., wound bed color, size, drainage, etc.) obtained when inspecting the wound.
6. How the resident tolerated the procedure.
7. Any problems or complaints (e.g., pain or discomfort) made by the resident related to the procedure.
8. If the resident refused the treatment, the reason for refusal and the resident’s response to the explanation of the risks of refusing the procedure, the benefits of accepting and available alternatives. Document family and physician notification of refusal.
9. The signature and title (or initials) of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the dressing change.
2. Report other information in accordance with facility policy and professional standards of practice.

Version	1.1 (H5MAPR0115)

Dressings, Sterile

Level III

Purpose

The purpose of this procedure is to provide guidelines for the application of sterile dressings.

Preparation

1. Verify that there is a physician's order for this procedure. (**Note:** This may be generated from a facility protocol.)
2. Review the resident's care plan, current orders, and diagnoses to determine if there are special resident needs.
3. Check the treatment record.
4. Assemble the equipment and supplies as needed. Date and initial all bottles and jars upon opening. Wipe nozzles, foil packets, bottle tops, etc., with alcohol pledget before opening, as necessary. (**Note:** This may be performed at the treatment cart.)
5. Explain procedure to the resident and provide privacy.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sterile dressing tray;
2. Cleaning solution, as ordered;
3. Tape;
4. Scissors;
5. Sterile gauze; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Clean bedside stand. Establish a clean field.
2. Place the clean equipment on the clean field. Arrange the supplies so they can be easily reached.
3. Tape a biohazard or plastic bag on the bedside stand or use a waste basket below the clean field.
4. Position resident and adjust clothing to provide access to affected area.
5. Wash and dry your hands thoroughly.
6. Put on clean gloves. Loosen tape and remove soiled dressing.
7. Pull glove over dressing and discard into plastic or biohazard bag.
8. Wash and dry your hands thoroughly.
9. Open sterile dressing tray, touching only the exterior surface, and carefully open the exterior wrapping to create a sterile field.
10. Using sterile technique, open other sterile products (i.e., prescribed dressing, sterile gauze) and drop onto sterile field.
11. Wash and dry your hands thoroughly.
12. Put on sterile gloves.
13. Assess the wound and surrounding skin for edema, redness, drainage, progress of tissue healing, and wound stage.

continues on next page

14. Cleanse the wound using sterile forceps to hold gauze. Use separate gauze for each cleansing stroke. Clean from the least contaminated area to the most contaminated area (usually, from the center outward).
15. Use dry gauze to pat the wound dry.
16. Apply the ordered dressing and secure with tape. (**Note:** Use non-allergenic tape, as indicated.) Label tags (tape or sterile kit label) with date and initials to top of dressing.
17. Discard disposable items into the designated container.
18. Remove disposable gloves and discard into designated container. Wash and dry your hands thoroughly.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. Clean the bedside stand.
22. Wash and dry your hands thoroughly.
23. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record, treatment sheet or designated wound form:

1. The date and time the dressing was changed.
2. Wound appearance, including wound bed, edges, presence of drainage.
3. The name and title (or initials) of the individual changing the sterile dressing.
4. The type of dressing used and wound care given.
5. All assessment data (i.e., wound bed color, size, drainage, etc.) obtained when inspecting the wound.
6. How the resident tolerated the procedure.
7. Any problems or complaints (e.g., pain or discomfort) made by the resident related to the procedure.
8. Complications related to the wound (e.g., pain, redness, drainage, swelling, bleeding).
9. If the resident refused the treatment, the reason for refusal and the resident’s response to the explanation of the risks of refusing the procedure, the benefits of accepting and available alternatives. Document family and physician notification of refusal.
10. The signature and title (or initials) of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the dressing change.
2. Report other information in accordance with facility policy and professional standards of practice.

Jackson-Pratt (JP) Drain

Level II

Purpose

The purpose of this procedure is to empty the Jackson-Pratt drain bulb, clean the surgical wound, and monitor for infection.

General Guidelines

1. At first, fluid from the drain will appear bloody.
2. As the wound heals, the fluid will change to light pink, light yellow, or clear.
3. The drain will stay in place until less than 30 mL (about 2 tablespoons) of fluid can be collected in a 24-hour period.
4. Empty the bulb every 8 to 12 hours or when it is half full.

Steps in the Procedure

Emptying the drain:

1. Wash your hands well with soap and water.
2. Pull the plug out of the bulb.
3. Pour the fluid inside the bulb into a measuring cup.
4. Clean the plug with alcohol.
5. Squeeze the bulb flat.
6. While the bulb is flat, put the plug back into the bulb.
7. The bulb should stay flat after it is plugged so that the vacuum suction can restart.
8. If you can't squeeze the bulb flat and plug it at the same time, use a hard, flat surface (such as a table) to help you press the bulb flat while you replug it.
9. Measure how much fluid is collected.
10. Record the amount of drainage, and the date and time you collected it, on the JP drainage chart.
11. Flush the fluid down the toilet.
12. Wash your hands.

Caring for the skin and the drain site:

1. Wash your hands well with soap and water.
2. Remove the dressing from around the drain.
 - a. Use soap and water or 0.9 percent normal saline (on a gauze or cotton swab) to clean the drain site and the skin around it.
 - b. Clean this area once a day.
3. When the drain site is clean and dry, put a new dressing around the drain. Put surgical tape on the dressing to hold it down against the skin.
4. Discard the dressing according to protocol.
5. Wash your hands.

continues on next page

Complications

1. If a large amount of fluid leaks from around the drain site (making the gauze dressing wet), use soap and water to clean the area. Verify that the bulb drain is secured and “flat” to provide the needed suction.
2. If a clot appears within the drain (dark, stringy lining), this could prevent the drainage from flowing through the tube.
3. The skin around the drain may become infected. Signs and symptoms of infection include:
 - a. increased redness;
 - b. increased pain;
 - c. increased swelling;
 - d. fever greater than 101°F; and
 - e. cloudy yellow, tan, or foul-smelling drainage.

Documentation

Document the following information in the resident’s medical record.

1. The date, time and amount of fluid removed from the drain.
2. Any signs or symptoms of complications.
3. Signature and title of the individual performing the procedure.

Reporting

Report any complications to the nurse in charge or the attending physician.

Negative Pressure Wound Therapy

Level III

Purpose

The purpose of this procedure is to provide guidelines for establishing and maintaining negative pressure wound therapy (NPWT).

Preparation

1. Verify that there is an order for this procedure.
2. Assess the wound prior to selecting the type, size and thickness of dressing material.

General Guidelines

1. NPWT is contraindicated in residents who have wounds with necrotic tissue with eschar, untreated osteomyelitis, non-enteric fistula or a malignancy in the wound.
2. Use aseptic technique when performing this procedure.
3. Change dressings per physician orders and manufacturer guidelines.

Equipment and Supplies

1. Primary Dressing (foam, gauze or silver-based sponge);
2. Clean scissors and/or sterile scalpel;
3. Skin prep;
4. Adhesive dressing (barrier dressing);
5. Tubing with adhesive pad; and
6. Negative pressure pump with disposable suction canister.

Steps in the Procedure

1. Identify and size the wound to be treated.
2. Wash hands and apply gloves.
3. Clean wound according to facility protocol, or as ordered.
4. Remove gloves.
5. Wash hands and apply clean gloves.
6. Cut sponge dressing to size:
 - a. Using clean scissors or scalpel, trim the sponge dressing material to a size that is slightly smaller than the wound, and a shape that approximates the wound.
 - b. Do not trim the sponge over the wound, as fragments may fall into the wound bed.
7. Create barrier dressing to protect healthy skin (as needed):
 - a. Estimate the size of barrier dressing that will need to be cut. There should be at least a 1 inch barrier around the margins of the wound.
 - b. Cut the dressing with clean scissors.
 - c. Apply skin prep to the peri-wound skin.
 - d. Apply barrier dressing over the top of the wound.

continues on next page

- e. Carefully trim a hole in the dressing to expose the wound and allow insertion of the sponge/gauze dressing.
- f. Alternatively, the drape may be cut and placed in stripes surrounding the wound and leaving the wound gravity open.
- g. For cavity dressing (foam or sponge):
 - (1) Gently insert the sponge/gauze dressing into the wound.
 - (2) Do not place sponge/gauze into places of the wound that cannot be seen or tunnels that have not been explored.
 - (3) Ensure sponge to sponge contact if more than one piece is placed in the wound.
 - (4) The depth of the sponge/gauze dressing should be such that the wound is just filled, or slightly under-filled.
8. Apply secondary layer of barrier adhesive (drape):
 - a. Cut another piece of adhesive dressing to drape the site and create a vacuum seal over the wound.
 - b. The drape should cover a 3-5 cm border of intact peri-wound skin.
 - c. Apply this layer of adhesive dressing, smoothing it and ensuring adhesion to the edges of the wound as you peel off the backing.
 - d. Avoid pulling or stretching the adhesive when applying.
 - e. Once the dressing is applied and smoothed, remove the top layer of backing.
9. Apply adhesive pad with tubing to the wound:
 - a. Cut a hole in the barrier adhesive layer (unless previously cut) so that the sponge/gauze dressing is exposed.
 - b. The hole should be large enough to expose the sponge to the negative pressure tubing but not exceed the edges of the wound (approximately 2.5 cm in diameter).
 - c. Do not cut a slit or an "x," as this may reseal with negative pressure.
 - d. Place the tubing with adhesive pad over the wound and slowly remove the backing.
 - e. Clamp tubing.
10. Assemble pump and disposable canister:
 - a. Connect secondary tubing to disposable suction canister.
 - b. Attach canister to vacuum device/pump.
 - c. Clamp tubing.
11. Connect device (canister) tubing to wound tubing. Turn to lock in place.
12. Unclamp both sides of tubing.
13. Turn on pump:
 - a. Initiate negative pressure setting on the pump as ordered (-125 mm/hg is a typical default setting).
 - b. Establish negative pressure setting (as ordered).
 - c. Establish therapeutic time setting (as ordered).
 - d. Follow manufacturer's directions for pump usage and alarms.

Documentation

Document the following in the resident's medical record:

1. The wound status at time of application of negative pressure.
2. The number of sponge pieces used in the wound dressing.
3. The negative pressure and time settings on the pump.
4. The resident's tolerance of the procedure.
5. The date and time of the dressing application/change.

continues on next page

6. The date and time negative pressure therapy was started and stopped.
7. The name and initials of the person performing the procedure.

Reporting

1. Any problems with the procedure.
2. Marked changes in the wound from baseline or previous dressing change.

Version	1.0 (H5MAPR0331)

Pressure Injuries Overview

Purpose

The purpose of this procedure is to provide information regarding definitions and clinical features of pressure injuries.

- General definitions are derived from the State Operation Manual, Appendix PP: §483.25(b)(1) Pressure ulcers (F686).
- Pressure injuries for purposes of staging reference the National Pressure Injury Advisory Panel Classification System.
- MDS assessments reference current definitions in the Resident Assessment Instrument User's Manual.

General Definitions (State Operations Manual, Appendix PP)

Pressure Ulcer/Injury (PU/PI) refers to localized damage to the skin and/or underlying soft tissue usually over a bony prominence or related to a medical or other device.

- A pressure injury will present as intact skin and may be painful.
- A pressure ulcer will present as an open ulcer, the appearance of which will vary depending on the stage and may be painful.
- Pressure ulcers/injuries occur as a result of intense and/or prolonged pressure or pressure in combination with shear. The tolerance of soft tissue for pressure and shear may also be affected by skin temperature and moisture, nutrition, perfusion, co-morbidities and condition of the soft tissue.

Avoidable/Unavoidable

- “Avoidable” means that the resident developed a pressure ulcer/injury and that one or more of the following was not completed:
 - Evaluation of the resident's clinical condition and risk factors;
 - Definition or implementation of interventions that are consistent with resident needs, resident goals, and professional standards of practice;
 - Monitoring or evaluation of the impact of the interventions; or
 - Revision of the interventions as appropriate.
- “Unavoidable” means that the resident developed a pressure ulcer/injury even though the following were completed:
 - Evaluation of the resident's clinical condition and risk factors;
 - Definition or implementation of interventions that are consistent with resident needs, resident goals, and professional standards of practice;
 - Monitoring or evaluation of the impact of the interventions; and
 - Revision of the interventions as appropriate.

Colonized/Infected

- “Colonized” refers to the presence of micro-organisms on the surface or in the tissue of a wound without the signs and symptoms of an infection.
- “Infected” refers to the presence of micro-organisms in sufficient quantity to overwhelm the defenses of viable tissues and produce the signs and symptoms of infection.

continues on next page

Debridement is the removal of devitalized/necrotic tissue and foreign matter from a wound to improve or facilitate the healing process. Debridement methods may include a range of treatments such as the use of enzymatic dressings to surgical debridement in order to remove tissue or matter from a wound to promote healing.

Eschar/Slough

- “Eschar” is dead or devitalized tissue that is hard or soft in texture; usually black, brown, or tan in color; and may appear scab-like. Necrotic tissue and eschar are usually firmly adherent to the base of the wound and often the sides/edges of the wound.
- “Slough” is non-viable yellow, tan, gray, green or brown tissue; usually moist; can be soft, stringy and mucinous in texture. Slough may be adherent to the base of the wound or present in clumps throughout the wound bed.

Exudate

- “Exudate” is any fluid that has been forced out of the tissues or its capillaries because of inflammation or injury. It may contain serum, cellular debris, bacteria and leukocytes.
- “Purulent exudate/drainage/discharge” is any product of inflammation that contains pus (e.g., leukocytes, bacteria, and liquefied necrotic debris).
- “Serous drainage or exudate” is watery, clear, or slightly yellow/tan/pink fluid that has separated from the blood and presents as drainage.

Friction/Shearing

- “Friction” is the mechanical force exerted on skin that is dragged across any surface.
- “Shearing” occurs when layers of skin rub against each other or when the skin remains stationary and the underlying tissue moves and stretches and angulates or tears the underlying capillaries and blood vessels causing tissue damage.

Granulation Tissue is the pink-red moist tissue that fills an open wound when it starts to heal. It contains new blood vessels, collagen, fibroblasts, and inflammatory cells.

Kennedy Terminal Ulcer is an unavoidable pressure ulcer that develops at the end of life. KTUs have certain characteristics which differentiate them from pressure ulcers such as the following:

- Appear suddenly and within hours;
- Usually appear on the sacrum and coccyx but can appear on the heels, posterior calf muscles, arms and elbows;
- Edges usually irregular and are red, yellow, and black as the ulcer progresses, often described as pear, butterfly or horseshoe shaped; and
- Often appear as an abrasion, blister, or darkened area and may develop rapidly to a Stage 2, Stage 3, or Stage 4 injury.

Tissue tolerance is the ability of the skin and its supporting structures to endure the effects of pressure, without adverse effects. Tissue tolerance affects the length of time a resident can maintain a position without suffering a pressure ulcer/injury.

Tunnel/Sinus Tract/Undermining – The terms tunnel and sinus tract are often used interchangeably.

- A “tunnel” is a passageway of tissue destruction under the skin surface that has an opening at the skin level from the edge of the wound.
- A “sinus tract” is a cavity or channel underlying a wound that involves an area larger than the visible surface of the wound.

continues on next page

- “Undermining” is the destruction of tissue or ulceration extending under the skin edges (margins) so that the pressure ulcer is larger at its base than at the skin surface. Undermining often develops from shearing forces and is differentiated from tunneling by the larger extent of the wound edge involved and the absence of a channel or tract extending from the pressure ulcer under the adjacent intact skin.

Staging (National Pressure Injury Advisory Panel Classification System)

Stage 1 Pressure Injury: Non-blanchable erythema of intact skin

- Intact skin with a localized area of non-blanchable erythema (redness), which may appear differently in darkly pigmented skin.
- Presence of blanchable erythema or changes in sensation, temperature, or firmness may precede visual changes.
- Color changes do not include purple or maroon discoloration; these may indicate deep tissue pressure injury.

Stage 2 Pressure Injury: Partial-thickness skin loss with exposed dermis

- Partial-thickness loss of skin with exposed dermis.
- The wound bed is viable, pink or red, moist, and may also present as an intact or ruptured serum-intact blister.
- Adipose (fat) is not visible and deeper tissues are not visible.
- Granulation tissue, slough and eschar are not present.
- Commonly result from adverse microclimate and shear in the skin over the pelvis and shear in the heel.
- This stage should not be used to describe moisture-associated skin damage including continence-associated dermatitis, intertriginous dermatitis, medical adhesive-related skin injury, or traumatic wounds (skin tears, burns, abrasions).

Stage 3 Pressure Injury: Full-thickness skin loss

- Full-thickness loss of skin, in which adipose (fat) is visible in the ulcer and granulation tissue and epibole (rolled wound edges) are often present.
- Slough and/or eschar may be visible.
- The depth of tissue damage varies by anatomical location; areas of significant adiposity can develop deep wounds.
- Undermining and tunneling may occur.
- Fascia, muscle, tendon, ligament, cartilage and/or bone are not exposed.
- If slough or eschar obscures the wound bed, this is an Unstageable PI.

Stage 4 Pressure Injury: Full-thickness skin and tissue loss

- Full-thickness skin and tissue loss with exposed or directly palpable fascia, muscle, tendon, ligament, cartilage or bone in the ulcer.
- Slough and/or eschar may be visible.
- Epibole (rolled edges), undermining and/or tunneling often occur.
- Depth varies by anatomical location.
- If slough or eschar obscures the extent of tissue loss, this is an Unstageable PI.

Unstageable Pressure Ulcer: Obscured full-thickness skin and tissue loss

- Full-thickness skin and tissue loss in which the extent of tissue damage within the ulcer cannot be confirmed because it is obscured by slough or eschar.
- If the slough or eschar is removed, a Stage 3 or Stage 4 pressure ulcer will be revealed.

continues on next page

- Stable eschar (i.e. dry, adherent, intact without erythema or fluctuance) on the heel or ischemic limb should not be softened or removed.

Deep Tissue Pressure Injury (DTPI): Persistent non-blanchable deep red, maroon or purple discoloration

- Intact or non-intact skin with localized area of persistent non-blanchable deep red, maroon, purple discoloration or epidermal separation reveals a dark wound bed or blood-filled blister.
- Pain and temperature change often precede skin color changes.
- Discoloration may appear differently in darkly pigmented skin.
- This injury results from intense and/or prolonged pressure and shear forces at the bone-muscle interface.
- The wound may evolve rapidly to reveal the actual extent of tissue injury, or many resolve without tissue loss.
- If necrotic tissue, subcutaneous tissue, granulation tissue, fascia, muscle, or other underlying structures are visible, this indicates a full thickness pressure injury (Unstageable, Stage 3 or Stage 4).
- Do not use DTPI to describe vascular, traumatic, neuropathic, or dermatologic conditions.

Pressure Injury Risk Assessment

Level III

Purpose

The purpose of this procedure is to provide guidelines for the structured assessment and identification of residents at risk of developing new pressure injuries or worsening of existing pressure injuries (PIs).

General Guidelines

1. The purpose of a pressure injury risk assessment is to identify all risk factors and then to determine which can be modified and which cannot, or which can be immediately addressed and which will take time to modify.
2. Risk factors that increase a resident's susceptibility to develop or to not heal PIs include, but are not limited to:
 - a. Under nutrition, malnutrition, and hydration deficits;
 - b. Impaired/decreased mobility and decreased functional ability;
 - c. The presence of previously healed PI;
 - d. The presence of existing PI;
 - e. Exposure of skin to urinary and fecal incontinence or other source of moisture;
 - f. Elevated body temperature;
 - g. Altered skin status over pressure points;
 - h. Impaired perfusion, oxygenation or circulation deficits, for example, generalized atherosclerosis or lower extremity arterial insufficiency;
 - i. Conditions, such as end stage renal disease, thyroid disease or diabetes mellitus;
 - j. Drugs such as steroids that may affect healing;
 - k. Advanced age;
 - l. Impaired sensory perception;
 - m. Cognitive impairment; and
 - n. Resident refusal of some aspects of care and treatment.
3. The risk assessment should be conducted as soon as possible after admission, but no later than eight hours after admission is completed.
4. Use only a facility-approved risk assessment tool to obtain risk assessment data.
5. Supplement the risk assessment tool with assessment of additional risk factors.
6. Once the assessment is conducted and risk factors are identified and characterized, a resident-centered care plan can be created to address the modifiable risks for pressure injuries.
7. Repeat the risk assessment weekly for the first four weeks, if there is a significant change in condition, or as often as is required based on the resident's condition.

Steps in the Procedure

1. Gather assessment tools and documentation and conduct the assessment in the manner most appropriate to the resident's condition and willingness to participate.
2. If necessary, allow the resident to take rest periods during the assessment.
3. Conduct a structured pressure injury risk assessment using a facility-approved tool.

continues on next page

4. Conduct a comprehensive skin assessment with every risk assessment.
 - a. When conducting a skin assessment, provide for the resident's privacy.
 - b. Once inspection of skin is completed document the findings on a facility-approved skin assessment tool.
 - c. If a new skin alteration is noted, initiate a (pressure or non-pressure) form related to the type of alteration in skin.
5. Develop the resident-centered care plan and interventions based on the risk factors identified in the assessments, the condition of the skin, the resident's overall clinical condition, and the resident's stated wishes and goals.
 - a. The interventions must be based on current, recognized standards of care.
 - b. The effects of the interventions must be evaluated.
 - c. The care plan must be modified as the resident's condition changes, or if current interventions are deemed inadequate.

Documentation

The following information should be recorded in the resident's medical record utilizing facility forms:

1. The type of assessment(s) conducted.
2. The date and time and type of skin care provided, if appropriate.
3. The name and title (or initials) of the individual who conducted the assessment.
4. Any change in the resident's condition, if identified.
5. The condition of the resident's skin (i.e., the size and location of any red or tender areas), if identified.
6. How the resident tolerated the procedure or his/her ability to participate in the procedure.
7. Any problems or complaints made by the resident related to the procedure.
8. If the resident refused the treatment, the reason for refusal and the resident's response to the explanation of the risks of refusing the procedure, the benefits of accepting and available alternatives. Document family and physician notification of refusal.
9. Observations of anything unusual exhibited by the resident.
10. The signature and title (or initials) of the person recording the data.
11. Initiation of a (pressure or non-pressure) form related to the type of alteration in skin if new skin alteration noted.
12. Documentation in medical record addressing MD notification if new skin alteration noted with change of plan of care, if indicated.
13. Documentation in medical record addressing family, guardian or resident notification if new skin alteration noted with change of plan of care, if indicated.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.
3. Notify attending MD if new skin alteration noted.
4. Notify family, guardian or resident update if new skin alteration noted.

Prevention of Pressure Injuries

Level II

Purpose

The purpose of this procedure is to provide information regarding identification of pressure injury risk factors and interventions for specific risk factors.

Preparation

Review the resident's care plan and identify the risk factors as well as the interventions designed to reduce or eliminate those considered modifiable.

Risk Assessment

1. Assess the resident on admission (within eight hours) for existing pressure injury risk factors. Repeat the risk assessment weekly and upon any changes in condition.
2. Use a standardized pressure injury screening tool to determine and document risk factors.
3. Supplement the use of a risk assessment tool with assessment of additional risk factors.

Skin Assessment

1. Conduct a comprehensive skin assessment upon (or soon after) admission, with each risk assessment, as indicated according to the resident's risk factors, and prior to discharge.
2. During the skin assessment, inspect:
 - a. Presence of erythema;
 - b. Temperature of skin and soft tissue; and
 - c. Edema.
3. Inspect the skin on a daily basis when performing or assisting with personal care or ADLs.
 - a. Identify any signs of developing pressure injuries (i.e., non-blanchable erythema). For darkly pigmented skin, inspect for changes in skin tone, temperature, and consistency;
 - b. Inspect pressure points (sacrum, heels, buttocks, coccyx, elbows, ischium, trochanter, etc.);
 - c. Wash the skin after any episodes of incontinence, using pH balanced skin cleanser;
 - d. Moisturize dry skin daily; and
 - e. Reposition resident as indicated on the care plan

Prevention

Skin Care

1. Keep the skin clean and hydrated.
2. Clean promptly after episodes of incontinence.
3. Avoid alkaline soaps and cleansers.
4. Use a barrier product to protect skin from moisture.
5. Use incontinence products with high absorbency.
6. Do not rub or otherwise cause friction on skin that is at risk of pressure injuries.
7. Use facility-approved protective dressings for at risk individuals.

continues on next page

Nutrition

1. Conduct nutritional screenings for residents at risk.
2. Conduct a comprehensive nutritional assessment for any resident at risk of pressure injury who is screened to be at risk for malnutrition; and for all adult residents with a pressure injury.
3. Establish and implement a nutrition care plan for any resident with or at risk of a pressure injury who is malnourished or at risk of malnutrition.
4. Provide optimal hydration, nutrient, protein and calorie requirements as established by current practice guidelines.
5. Monitor the resident for weight loss and intake of food and fluids.
6. Include nutritional supplements in the resident’s diet to increase calories and protein, as indicated in the care plan.

Mobility/Repositioning

1. Reposition all residents with or at risk of pressure injuries on an individualized schedule, as determined by the interdisciplinary care team.
2. Choose a frequency for repositioning based on the resident’s risk factors and current clinical practice guidelines.
3. Teach residents who can change positions independently the importance of repositioning. Provide support devices and assistance as needed. Remind and encourage residents to change positions.

Support Surfaces and Pressure Redistribution

1. Select appropriate support surfaces based the resident’s risk factors, in accordance with current clinical practice.

Device-Related Pressure Injuries

1. Review and select medical devices with consideration to the ability to minimize tissue damage, including size, shape, its application and ability to secure the device.
2. Monitor regularly for comfort and signs of pressure-related injury.
3. For prevention measures associated with specific devices, consult current clinical practice guidelines.

Monitoring

1. Evaluate, report and document potential changes in the skin.
2. Review the interventions and strategies for effectiveness on an ongoing basis.

Skin Tears – Abrasions and Minor Breaks, Care of

Level II

Purpose

The purpose of this procedure is to guide the prevention and treatment of abrasions, skin tears, and minor breaks in the skin.

Preparation

1. Obtain a physician's order as needed. Document physician notification in medical record.
2. Review the resident's care plan, current orders, and diagnoses to determine resident needs.
3. Check the treatment record.
4. Generate "Non-Pressure" form and complete.
5. Assemble the equipment and supplies as needed.

General Guidelines

1. An abrasion is an area on the skin that has been damaged by friction, scraping, rubbing or trauma. A skin tear is the disruption of epidermis resulting in a lifting or friction of the skin.
2. If the wound is bleeding, gently apply a compress with pressure over the wound and reinforce the compress as needed to control any bleeding.
3. If the bleeding persists after efforts to stop it, or an object is embedded into the abrasion, or other medical attention is needed, notify the physician.

Equipment and Supplies

The following equipment and supplies may be necessary when performing this procedure:

1. Dressing material, as indicated (i.e., gauze, non-adhesive dressing, bandage, steri-strips tape, scissors, etc.);
2. Compress, as needed;
3. Disposable cloths, as needed;
4. Wound cleanser/normal saline (as ordered); and
5. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Clean bedside stand. Establish a clean field.
2. Place the clean equipment on the clean field. Arrange the supplies so they can be easily reached.
3. Tape a biohazard or plastic bag on the bedside stand or use a waste basket below clean field.
4. Adjust the height of the bed to waist level.
5. Position resident and adjust clothing to provide access to affected area.
6. Wash and dry your hands thoroughly.
7. Put on clean gloves. Loosen tape and remove soiled dressing.
8. Pull glove over dressing and discard into plastic or biohazard bag.
9. Wash and dry your hands thoroughly.

continues on next page

10. Open dry, clean dressing(s) by pulling corners of the exterior wrapping outward, touching only the exterior surface.
11. Label tape or dressing with date, time and initials. Place on clean field.
12. Using clean technique, open other products (i.e., prescribed dressing; dry, clean gauze).
13. Wash and dry your hands thoroughly.
14. Put on clean gloves.
15. Assess the wound and surrounding skin for edema, redness, drainage, tissue healing progress and wound stage.
16. Cleanse the wound with ordered cleanser. Use a syringe to irrigate the wound, if ordered. If using gauze, use a clean gauze for each cleansing stroke. Clean from the least contaminated area to the most contaminated area (usually, from the center outward).
17. Use dry gauze to pat the wound dry.
18. Apply the ordered dressing and secure with tape or bordered dressing per order. (Note: Use non-allergenic tape as indicated.) Label with date and initials to top of dressing.
19. Discard disposable items into the designated container.
20. Remove disposable gloves and discard into designated container. Wash and dry your hands thoroughly.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. Clean the bedside stand.
24. Wash and dry your hands thoroughly.
25. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

Record the following information in the resident's medical record:

1. Complete in-house investigation of causation.
2. Generate "Non-Pressure" form.
3. Document physician and family notification, and resident education (if completed) in medical record.
4. How the resident tolerated the procedure.
5. Any problems or resident complaints related to the procedure.
6. Any complications related to the abrasion (e.g., pain, redness, drainage, swelling, bleeding, decreased movement).
7. If the resident refused the treatment, the reason for refusal and the resident's response to the explanation of the risks of refusing the procedure, the benefits of accepting and available alternatives.
8. Interventions implemented or modified to prevent additional abrasions (e.g., clothes that cover arms and legs).
9. When an abrasion/skin tear/bruise is discovered, complete a *Report of Incident/ Accident*.

Reporting

1. Notify the responsible family member. Physician notification may be routine (that is, non-immediate) if the abrasion is uncomplicated or not associated with significant trauma.
2. Notify the physician of any abnormalities (i.e., excessive bleeding, localized swelling, redness, drainage, tenderness, pain etc.).
3. Report other information in accordance with facility policy/guideline and professional standards of practice.

Staple and Suture Removal

Level III

Purpose

The purpose of this procedure is to provide guidelines for the removal of staples or sutures from a healing wound or a tube/drain site.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan, current orders, and diagnoses to determine if there are special resident needs.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Disposable suture removal set or staple remover;
2. Sterile dressing strips, if requested by physician; and
3. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Clean bedside stand. Establish a clean field.
2. Place the clean equipment on the clean field. Arrange the supplies so they can be easily reached.
3. Wash and dry your hands thoroughly.
4. Put on gloves. Gowns will only be necessary if soiling of your skin or clothing with blood, urine, feces, or other body fluids is likely. Masks and eyewear will only be necessary if splashing of blood or other body fluids into your eyes or mouth is likely.
5. When removing staples, take out alternate staples to ensure wound edges are approximate.
6. Assess resident for pain during procedure.

To remove staples:

7. Insert one side of the staple remover under the staple;
8. Depress handle of staple remover; and
9. When the staple releases, gently pull the staple from the wound.

To remove sutures

10. Lift the knot with the suture forceps;
11. Using scissors, clip the suture next to the skin; and
12. Pull suture from skin.

13. Discard all suture material into the designated container.
14. Clean wound area according to physician orders.
15. Allow area to dry.
16. Apply sterile dressing strips, if ordered by physician.

continues on next page

17. Discard disposable items into the designated container.
18. Remove disposable gloves and discard into designated container. Wash and dry your hands thoroughly.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. Clean the bedside stand.
22. Wash and dry your hands thoroughly.
23. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the staples/sutures were removed.
2. The name and title (or initials) of the individual(s) who removed the staples/sutures.
3. All assessment data (e.g., skin condition) obtained when removing the staples/sutures.
4. How the resident tolerated the procedure.
5. Any problems or complaints made by the resident related to the procedure.
6. If the resident refused the treatment, the reason for refusal and the resident's response to the explanation of the risks of refusing the procedure, the benefits of accepting and available alternatives. Document family and physician notification of refusal.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the staple/suture removal.
2. Report other information in accordance with facility policy and professional standards of practice.

Support Surface Guidelines

Purpose

The purpose of this procedure is to provide guidelines for the assessment of appropriate pressure reducing and relieving devices for residents at risk of skin breakdown.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Redistributing support surfaces are to promote comfort for all bed- or chairbound residents, prevent skin breakdown, promote circulation and provide pressure relief or reduction.
2. Support surfaces alone are not effective in preventing pressure ulcers, but studies indicate that the use of appropriate support surfaces with interventions such as turning, repositioning and moisture management can assist in reducing pressure ulcer development.
3. Support surfaces are modifiable. Individual resident needs differ.
4. Elements of support surfaces that are critical to pressure ulcer prevention and general safety include pressure redistribution, moisture control, shear reduction, heat dissipation/ temperature control, friction control, infection control, flammability, and life expectancy.
5. Selecting a mattress for the resident based on pressure ulcer risk is both cost-effective and clinically appropriate.
6. Do not use donut-shaped cushions.

Steps in the Procedure

Guidelines for Selecting Appropriate Pressure-Relieving Devices

1. Any individual at risk for developing pressure ulcers should be placed on a redistribution support surface, such as foam, gel, static air, alternating air, or air-loss or gel when lying in bed.
2. Use a pressure ulcer risk scale such as the Braden Scale to help determine need for and appropriate type of pressure-relieving devices. Refer to bed selection algorithm for support surface selection.
3. Assess residents who can reposition independently to determine the need for assistive devices that will help to maintain independent positioning.

Interventions/Care Strategies

1. Any individual at risk for developing pressure ulcers should be placed on a redistribution support surface, such as foam, static air, alternating air, gel, or air-loss device, when lying in bed.
2. For residents that recline and depend on staff for repositioning, change positions at least q 2 hours.
3. Reposition residents who are in a chair at least q 2 hours.
4. Avoid placing resident on the greater trochanter for more than momentary placement.
5. When residents are in a bed or chair, pillows are an effective method of redistributing pressure.
6. Monitor for other pressure ulcer risk factors and provide interventions as indicated.

Wound Care

Level III

Purpose

The purpose of this procedure is to provide guidelines for the care of wounds to promote healing.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
 - a. For example, the resident may have PRN orders for pain medication to be administered prior to wound care.
3. Assemble the equipment and supplies as needed. Date and initial all bottles and jars upon opening. Wipe nozzles, foil packets, bottle tops, etc., with alcohol pledget before opening, as necessary. (Note: This may be performed at the treatment cart.)

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Dressing material, as indicated (i.e., gauze, tape, scissors, etc.);
2. Disposable cloths, as indicated;
3. Antiseptic (as ordered); and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Use disposable cloth (paper towel is adequate) to establish clean field on resident's overbed table. Place all items to be used during procedure on the clean field. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Position resident. Place disposable cloth next to resident (under the wound) to serve as a barrier to protect the bed linen and other body sites.
4. Put on exam glove. Loosen tape and remove dressing.
5. Pull glove over dressing and discard into appropriate receptacle. Wash and dry your hands thoroughly.
6. Put on gloves. Gowns will only be necessary if soiling of your skin or clothing with blood, urine, feces, or other body fluids is likely. Masks and eyewear will only be necessary if splashing of blood or other body fluids into your eyes or mouth is likely.
7. Use no-touch technique. Use sterile tongue blades and applicators to remove ointments and creams from their containers.
8. Pour liquid solutions directly on gauze sponges on their papers.
9. Wear exam gloves for holding gauze to catch irrigation solutions that are poured directly over the wound.
10. Wear sterile gloves when physically touching the wound or holding a moist surface over the wound.
11. Place one (1) gauze to cover all broken skin. Wash tissue around the wound that is usually covered by the dressing, tape or gauze with antiseptic or soap and water.
12. Remove dry gauze. Apply treatments as indicated.
13. Dress wound. Pick up sponge with paper and apply directly to area. Mark tape with initials, time, and date and apply to dressing.

continues on next page

14. Be certain all clean items are on clean field.
15. Remove the disposable cloth next to the resident and discard into the designated container.
16. Discard disposable items into the designated container. Discard all soiled laundry, linen, towels, and washcloths into the soiled laundry container. Remove disposable gloves and discard into designated container. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable. Use supportive devices as instructed.
18. Place the call light within easy reach of the resident.
19. Use clean field saturated with alcohol to wipe overbed table.
20. Return the overbed table to its proper position.
21. Wipe reusable supplies with alcohol as indicated (i.e., outsides of containers that were touched by unclean hands, scissor blades, etc.). Return reusable supplies to resident's drawer in treatment cart.
22. Take only the disposable supplies that are necessary for the treatment into the room. Disposable supplies cannot be returned to the cart.
23. Wash and dry your hands thoroughly.
24. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The type of wound care given.
2. The date and time the wound care was given.
3. The position in which the resident was placed.
4. The name and title of the individual performing the wound care.
5. Any change in the resident's condition.
6. All assessment data (i.e., wound bed color, size, drainage, etc.) obtained when inspecting the wound.
7. How the resident tolerated the procedure.
8. Any problems or complaints made by the resident related to the procedure.
9. If the resident refused the treatment and the reason(s) why.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the wound care.
2. Report other information in accordance with facility policy and professional standards of practice.

Urinary Incontinence – Clinical Protocol

Assessment and Recognition

1. As part of the initial assessment, the physician will help identify individuals with impaired urinary continence; i.e., reduced ability to maintain urine in a socially appropriate manner.
 - a. For example, review of a hospital discharge summary may reveal that the individual was incontinent with or without catheter placement during a recent hospitalization, or a previous urology evaluation may have identified bladder outlet obstruction.
2. In addition, the nurse shall assess and document/report the following:
 - a. Vital signs;
 - b. Neurological abnormalities;
 - c. Assess pelvic area;
 - d. Digital rectal examination;
 - e. Resident's age and sex;
 - f. Whether this is a change in customary pattern since last physician visit;
 - g. All active diagnoses; and
 - h. All current medications.
3. As part of the physical examination, the physician will look for findings related to continence such as a prolapsed uterus, prostate enlargement, use of a urinary catheter, evidence of abdominal or urologic surgery, and/or diuretic use.
4. For incontinent individuals, the nursing staff will identify and document circumstances related to the incontinence; for example, frequency, nocturia, dysuria, or relationship to coughing or sneezing.
5. The staff and physician will identify individuals who are continent but have risk factors for becoming incontinent; for example, because of immobility, delirium, benign prostatic hypertrophy, diabetic neuropathy, uterine prolapse, or diuretics used to treat congestive heart failure.
6. The staff and physician will identify individuals with complications of existing incontinence such as skin maceration or breakdown, or perineal dermatitis.

Cause Identification

1. The physician will identify potentially treatable medical and psychiatric conditions related to urinary incontinence; for example, dementia and stroke.
 - a. The review should focus especially on possibly treatable causes such as medication side effects, significant constipation, excessive intake of caffeinated beverages, or urinary tract infections.
2. The physician will order appropriate diagnostic tests such as a urinalysis, measuring post-void residual, or referral for a cystoscopy or cystometrogram.
 - a. Alternatively, the physician should document if a resident cannot or should not be tested; for example, an end of life situation, or a resident's inability to cooperate with the testing, or a previously identified untreatable cause.
3. The physician will categorize incontinence as urge, stress, overflow, or functional.
 - a. Identifying the correct category can help guide appropriate treatment selection.

continues on next page

Treatment/Management

1. If a resident is admitted from the hospital with a newly placed indwelling catheter, the attending physician and staff will evaluate the potential for removing the catheter.
2. The physician will address treatable causes of urinary retention and incontinence; for example, treating urethritis or tapering, stopping, or switching medications (for example, opioids, diuretics or medications with strong anticholinergic effects) that may cause or exacerbate urinary retention or incontinence.
3. The staff will identify environmental interventions and assistive devices (e.g., grab bars, raised toilet seats, bedside commodes, urinals, bed rails, restraints, and/or walkers) that facilitate toileting.
4. As appropriate, based on assessment of the category and causes of incontinence, the staff will provide scheduled toileting, prompted voiding, or other interventions to try to improve the individual's continence status.
5. When persistent or recurrent urinary retention is a problem, the staff and physician will seek treatable causes and try intermittent catheterization, if feasible, before placing an indwelling catheter.
6. Where indicated, the physician will order appropriate medications to address incontinence.
7. The physician will identify and refer, as appropriate, individuals who might benefit from urological procedures to address retention or improve continence.
8. The physician will identify and document clinically pertinent reasons why an indwelling urethral or suprapubic catheter is indicated, and will document why other alternatives are not feasible.
9. If a long-term indwelling catheter is needed, staff will monitor for and report identified or suspected complications such as urosepsis.
 - a. Virtually all individuals with indwelling urinary catheters eventually have bacteriuria. Asymptomatic bacteriuria in catheterized individuals should generally not be treated with antibiotics.

Monitoring

1. The staff and physician will review the progress of individuals with impaired continence until continence is restored or improved as much as possible, or it is identified that further improvement is unlikely.
 - a. This should include documentation of a resident's responses to attempted interventions such as scheduled toileting, prompted voiding, or medications used to treat incontinence.
2. The staff and physician will monitor the individual for complications of an indwelling catheter such as a symptomatic urinary tract infection, urosepsis, or urethral erosion or pain, and for complications of medications used to treat urinary incontinence.

Urinary Tract Infection/Bacteriuria – Clinical Protocol

Assessment and Recognition

1. The physician and staff will identify individuals with a history of symptomatic urinary tract infections, and those who have risk factors (for example, an indwelling urinary catheter, kidney stones, urinary outflow obstruction, etc.) for UTIs.
2. The staff and practitioner will identify individuals with possible signs and symptoms of a UTI.
 - a. Signs and symptoms of a UTI may be specific to the urinary tract and/or generalized. The presentation of symptomatic UTIs varies.
 - b. Nurses should observe, document, and report signs and symptoms (for example, fever or hema-turia) in detail and avoid premature diagnostic conclusions.
 - c. New onset of nonspecific or general symptoms alone (change in mental status, decline in appe-tite, etc.) is not enough to diagnose a UTI. Urine odor, color and clarity also are not adequate to indicate bacteriuria or a UTI.
 - d. Acute deterioration in previously stable chronic urinary symptoms may indicate an acute infec-tion. Multiple concurrent findings such as fever with hematuria or catheter obstruction are more likely to be due to a urinary source.
 - e. A positive urine culture in someone with chronic genitourinary symptoms is not enough to di-agnose a symptomatic UTI. The presence of either pyuria or a positive leukocyte esterase test alone are not enough to prove that the individual has a UTI, but the absence of pyuria or a neg-ative leukocyte esterase test is fairly strong evidence that a UTI is not present.

Cause Identification

1. The physician will help nursing staff interpret any signs, symptoms, and lab test results. Diagnosis must be based on the entire picture and not just on one or several findings in isolation.
 - a. Before diagnosing a UTI or urosepsis and ordering antibiotics, the physician should consider a resident's overall picture including specific evidence that helps confirm or refute the diagnosis of a UTI (as discussed above).
2. The physician will help identify causes of, and factors contributing to, bacteriuria or UTIs such as bladder outlet obstruction, kidney stones, neurological impairments, and medications that can cause urinary retention.
3. Because nonspecific or systemic symptoms can be due to diverse factors either instead of or along with a UTI, the staff and practitioner will also consider additional or alternative causes regardless of whether bacteriuria or urinary symptoms is present.
 - a. For example, a patient with a UTI could also have confusion caused by fluid and electrolyte imbalance such as hypernatremia as a result of several days of inadequate food and fluid in-take.

continues on next page

Treatment/Management

1. The physician will order appropriate treatment for verified or suspected UTIs and/or urosepsis based on a pertinent assessment.
 - a. Empirical treatment should be based on a documented description of an individual's symptoms and on consideration of relevant test results, co-existing illnesses and conditions, and pertinent risk factors.
 - b. Generally, symptomatic UTIs should be treated. Bacteriuria alone (an "asymptomatic UTI") should not be treated routinely, because treating it does not materially change outcomes, improve longevity, or correct underlying problems.
 - c. In select situations, empirical antimicrobial therapy may be warranted if urosepsis or other complications are suspected.
 - d. In select situations, empirical antimicrobial therapy may be warranted for afebrile individuals with non-specific symptoms.
2. The physician will not treat asymptomatic individuals whose urine is colonized with yeast or with multidrug-resistant organisms such as methicillin-resistant *Staphylococcus aureus* or enterococcus without careful review and clinical rationale.
3. The physician should consider stopping antibiotics or switching parenteral to oral antibiotics in individuals with uncomplicated UTIs who have been afebrile and asymptomatic for at least 48 hours.
4. The physician will help the staff identify suspected sepsis related to a UTI and identify whether hospitalization may be warranted.
5. Fever and change in mental status alone do not automatically warrant hospitalization, nor is there compelling evidence that hospitalization improves the ultimate outcomes in individuals with symptomatic UTIs. Sepsis, however, may sometimes warrant more aggressive inpatient treatment.

Monitoring

1. The physician and nursing staff will review the status of individuals who are being treated for a UTI and adjust treatment accordingly.
 - a. Decisions should be made primarily on the basis of clinical signs and symptoms. The goal of treatment in most cases is to control signs and symptoms of infection, not to eliminate bacteriuria.
 - b. Follow-up urine cultures after antibiotic treatment are not indicated routinely, but may be helpful if the symptoms are not resolving or complications are present.
2. When a resident has a persistent or recurrent urinary tract infection after treatment with antibiotics, the physician will review the situation carefully with the nursing staff and consider other or additional issues (such as urinary obstruction or indwelling catheter change or removal) before prescribing additional courses of antibiotics.
 - a. Physicians should justify continuing or resuming antibiotic treatment beyond an initial course.

End-Stage Renal Disease, Care of a Resident with

Policy Statement

Residents with end-stage renal disease (ESRD) will be cared for according to currently recognized standards of care.

Policy Interpretation and Implementation

1. Staff caring for residents with ESRD, including residents receiving dialysis care outside the facility, shall be trained in the care and special needs of these residents.
2. Education and training of staff includes, specifically:
 - a. the nature and clinical management of ESRD (including infection prevention and nutritional needs);
 - b. the type of assessment data that is to be gathered about the resident’s condition on a daily or per shift basis;
 - c. signs and symptoms of worsening condition and/or complications of ESRD;
 - d. how to recognize and intervene in medical emergencies such as hemorrhages and septic infections;
 - e. how to recognize and manage equipment failure or complications (according to the type of equipment used in the facility);
 - f. timing and administration of medications, particularly those before and after dialysis;
 - g. the care of grafts and fistulas; and
 - h. the handling of waste.
3. Education and training of staff in the care of ESRD/dialysis residents may be managed by the contracted dialysis facility or by a clinician with special training in ESRD and dialysis care.
4. Agreements between this facility and the contracted ESRD facility include all aspects of how the resident’s care will be managed, including:
 - a. how the care plan will be developed and implemented;
 - b. how information will be exchanged between the facilities; and
 - c. responsibility for waste handling, sterilization and disinfection of equipment.
5. The resident’s comprehensive care plan will reflect the resident’s needs related to ESRD/dialysis care.

Urinary Continence and Incontinence – Assessment and Management

Policy Statement

1. The staff and practitioner will appropriately screen for, and manage, individuals with urinary incontinence.
2. Management of incontinence will follow relevant clinical guidelines.
3. The physician and staff will provide appropriate services and treatment to help residents restore or improve bladder function and prevent urinary tract infections to the extent possible.
4. Indwelling urinary catheters will be used sparingly, for appropriate indications only.
5. Identification and management of urinary tract infections will follow relevant clinical guidelines. Antibiotics will be used appropriately.

Policy Interpretation and Implementation

1. As part of the initial and ongoing assessments, the nursing staff and physician will screen for information related to urinary continence. Examples of sources of such information may include the resident, family, or a hospital discharge summary describing placement of an indwelling urinary catheter during a recent hospitalization.
2. Relevant information related to urinary continence includes:
 - a. history of urinary incontinence; factors precipitating incontinence; and associated symptoms (dysuria, polyuria, hesitancy);
 - b. previous treatment/management attempts and response to interventions;
 - c. pertinent diagnoses, including congestive heart failure, stroke, diabetes mellitus, obesity, neurological disorders (Parkinson's disease, multiple sclerosis), and tumors affecting the urinary tract;
 - d. observations, including wet bed or clothing, prolapsed uterus, use of urinary catheter, evidence of abdominal or urologic surgery, and/or use of diuretics;
 - e. functional and/or cognitive capabilities or limitations that could affect continence, including impaired cognitive function or dementia, impaired mobility, decreased manual dexterity, decreased upper and lower extremity muscle strength, impaired vision, and pain with movement;
 - f. additional information such as the type and frequency of physical assistance necessary for the resident to access the toilet, commode, or urinal, and the scope of prompting needed to encourage urination; and
 - g. environmental factors and assistive devices that may restrict or facilitate a resident's ability to access the toilet, including grab bars, raised or lowered toilet seat, lighting, distance to toilet or bedside commode, availability of urinal, and use of bed rails or restraints.
3. Periodically (as required and when there is a change in voiding), staff will define each individual's level of continence, referring to the criteria in the Minimum Data Set (MDS), as follows:
 - a. Continent: The resident has been continent of urine for at least 7 days, with no episodes of incontinence.
 - b. Occasionally incontinent: The resident has had less than 7 bladder incontinence episodes per week. This includes any amount of urine sufficient to dampen undergarments, briefs or pads.

continues on next page

- c. Frequently incontinent: The resident has had at least 7 episodes of bladder incontinence in the previous 7 days, but the resident had at least one continent void.
 - d. Always incontinent: The resident has had no continent voids in the past 7 days.
 - e. Not rated: The resident has an indwelling catheter, condom catheter, ostomy, or no urine output (dialysis).
4. As part of its assessment, nursing staff will seek and document details related to continence. Relevant details include the following:
- a. Voiding patterns (frequency, volume, nighttime or daytime, quality of stream, etc.);
 - b. Associated pain or discomfort (dysuria); and
 - c. Types of incontinence:
 - (1) Stress – occurs with coughing, sneezing, laughing, lifting, etc.
 - (2) Urge – overactive or spastic bladder
 - (3) Mixed – stress incontinence with urgency
 - (4) Overflow – related to blocked urethra or weak bladder muscle
 - (5) Transient – temporary related to a potentially reversible or improvable condition
 - (6) Functional – related to inability to get to the toilet in time due to physical or cognitive impairment, or external obstacles.
5. The nursing staff and physician will identify risk factors for becoming incontinent or for worsening of current incontinence, including the following:
- a. Prostate cancer/BPH
 - b. Congestive heart failure
 - c. Cerebrovascular accident/ transient ischemic attack
 - d. Diabetes
 - e. Parkinson’s disease
 - f. Delirium
 - g. Urinary tract infections
 - h. Atrophic vaginitis (postmenopausal women)
 - i. Constipation/impaction
 - j. Caffeine use
 - k. Excessive fluid intake
 - l. Pain
 - m. Environmental factors (immobility, restraints, lack of access to toilet)
 - n. Bladder cancer
 - o. Neurogenic bladder
 - p. Spinal cord or brain lesions
 - q. Tabes dorsalis
6. The evaluation will include a review for medications that might affect continence, such as:
- a. narcotics and medications with anticholinergic properties (may cause urinary retention and possible overflow incontinence);
 - b. sedative/hypnotics (may cause sedation leading to functional incontinence);
 - c. diuretics (may cause urgency, frequency, or overflow incontinence); and
 - d. alpha-adrenergic agonists (may cause urinary retention in men) or antagonists (may cause stress incontinence in women).

continues on next page

7. The staff and physician will summarize an individual's continence status. For residents deemed incontinent, this includes categorizing incontinence as urge, stress, overflow, mixed, or functional; and relevant causes, risk factors, and complications.
8. The staff and physician will identify individuals with complications of existing incontinence, or who are at risk for such complications (e.g., skin maceration or breakdown, or perineal dermatitis).
9. The physician will consider a more detailed assessment if new incontinence is identified or risk factors and reversible causes have not yet been sought or identified. The review should focus especially on possibly treatable causes such as medication side effects, severe constipation, or urinary tract infections (distinguished from asymptomatic bacteriuria).
10. The staff and physician will identify the presence of any urinary tract infection that may be related to incontinence.
11. A urinalysis may detect hematuria and clinically significant pyuria, but otherwise is likely to have limited utility as a screening test because of the high prevalence of asymptomatic bacteriuria in the long-term care population.
12. Urinalysis should not be confused with a urine culture.
13. The presence of bacteriuria without symptoms, whether or not pyuria is present, does not usually merit antibiotic treatment, especially in individuals with indwelling urinary catheters.
14. Published criteria for a symptomatic urinary tract infection should be followed. These differ between the catheterized and non-catheterized resident.
15. If a resident/patient is admitted from the hospital with a newly placed indwelling catheter, the attending physician and staff will evaluate the potential for removing it, depending on the current condition and the rationale for its original placement.
16. The physician and staff will address treatable causes or contributing factors related to urinary incontinence, including:
 - a. tapering, stopping, or changing medications that may be causing or exacerbating incontinence;
 - b. managing pain and/or providing adaptive equipment to help mobilize individuals suffering from arthritis, contractures, neurological impairments, etc.;
 - c. incorporating environmental interventions and assistive devices (e.g., grab bars, raised toilet seats, bedside commodes, urinals, bed rails, restraints, and/or walkers) to facilitate toileting;
 - d. treating underlying conditions that may impair continence (e.g., delirium causing urinary incontinence related to acute confusion); and
 - e. implementing a fluid and/or bowel management program to meet assessed needs.
17. Where indicated, the staff and physician will treat symptoms of a UTI or urosepsis. Eradication of all bacteria may not always be feasible (e.g., in a resident who has an indwelling urinary catheter or other source of chronic bacteriuria).
18. As indicated, and if the individual remains incontinent despite treating transient causes of incontinence, the staff will initiate a toileting plan.
 - a. As appropriate, based on assessing the category and causes of incontinence, the staff will provide scheduled toileting, prompted voiding, or other interventions to try to manage incontinence.
 - b. Toileting programs will start with a 3- to 5-day toileting assistance trial.
 - c. If the individual requires assistance from more than one person to transfer to the toilet, staff will address his or her mobility problems before attempting a toileting assistance trial.

continues on next page

- d. Incontinence care should be individualized at night in order to maintain comfort and skin integrity, and minimize sleep disruption.
 - e. Prompted voiding is not helpful at night (e.g., between the hours of 10 p.m. and 5 a.m.) and has been shown to disrupt sleep.
19. The staff will document the results of the toileting trial in the resident’s medical record.
 - a. If the resident responds well, the toileting program will be continued.
 - b. If the resident does not respond and does not try to toilet, or for those with such severe cognitive impairment that they cannot either point to an object or say their own name, staff will use a “check and change” strategy.
 - c. A “check and change” strategy involves checking the resident’s continence status at regular intervals and using incontinence devices or garments. The primary goals are to maintain dignity and comfort and to protect the skin.
 20. Individuals who cooperate with prompted voiding and attempt to toilet regularly but have no reduction in incontinent episodes will be identified and referred to the physician for consideration of additional therapy such as a bladder relaxant medication.
 21. For individuals with persistent or recurrent urinary retention despite interventions, the staff and physician will seek treatable causes and consider intermittent catheterization, if feasible, before placing an indwelling catheter.
 22. The staff and physician will evaluate the effectiveness of interventions and implement additional pertinent interventions as indicated.
 23. The physician will identify and refer, as appropriate, individuals who might benefit from urological procedures to improve continence.
 24. The physician will identify situations in which an indwelling urethral or suprapubic catheter are indicated, and will document why other alternatives are not feasible.
 - a. Indwelling catheters shall not be used as a substitute for nursing care of the resident with urinary incontinence.
 - b. If an indwelling catheter is needed, staff will monitor for and report complications such as evidence of a symptomatic infection.

Behavioral Programs and Toileting Plans for Urinary Incontinence

Level III

Purpose

The purpose of this procedure is to provide guidelines for the initiation and monitoring of behavioral interventions and/or a toileting plan for the resident with urinary incontinence.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Conduct a thorough assessment of the resident and his or her environment to determine factors that may have contributed to any recent decline in urinary continence. For example:
 - a. a change in the resident's medical condition, cognitive status, and/or mobility;
 - b. new or altered medication regimen (e.g., diuretics, alpha-adrenergic agonists);
 - c. lack of staff familiarity with the resident's usual pattern of voiding; and
 - d. environmental impediments that affect the resident's continence.
3. Provide treatment and services to address factors that are potentially modifiable. For example:
 - a. managing pain;
 - b. providing adaptive equipment for residents with mobility problems;
 - c. removing or improving environmental impediments (lighting, distance to toilet or commode, etc.); and
 - d. reviewing medication regimen and notifying the physician with any concerns.
4. Monitor, record and evaluate information about the resident's bladder habits, and continence or incontinence, including:
 - a. voiding patterns (frequency, volume, time, quality of stream, etc.);
 - b. associated pain or discomfort (dysuria);
 - c. type of incontinence (stress, urge, mixed, overflow, functional, etc.);
 - d. level of incontinence (use MDS criteria); and
 - e. response to specific interventions.
5. Assess the resident for appropriateness of behavioral programs which promote urinary continence.
 - a. The resident must possess some essential skills to be successful with specific interventions attempted. Staff must identify whether the resident can:
 - (1) comprehend educational efforts and follow-through with instructions;
 - (2) identify the urge to urinate;
 - (3) potentially learn to control or inhibit the urge to void until reaching a toilet; and
 - (4) physically contract the pelvic floor muscles (Kegel Exercises) to inhibit the flow of urine, lessen urinary urgency/leakage, and/or respond to prompts to void.

continues on next page

General Guidelines

1. Options for managing urinary incontinence include primarily behavioral programs, toileting plans and medication therapy.
2. Behavioral programs that require the resident's cooperation and motivation in order for learning and practice to occur include the following:
 - a. bladder rehabilitation/bladder training; and
 - b. pelvic floor muscle rehabilitation.
3. Toileting Plans that are relatively more dependent on staff involvement and assistance as opposed to resident function include:
 - a. prompted voiding; and
 - b. habit training/scheduled voiding.

Equipment and Supplies

1. Assessment tools for measuring the resident's level of incontinence (MDS criteria).
2. Assessment information that has already been collected (admission data, medical record, etc.).
3. Adaptive equipment to improve the resident's mobility.
4. The resident's care plan.

Steps in the Procedure

1. Assess the resident for appropriateness of behavioral techniques or toileting plans being considered.
2. Record the resident's current voiding pattern, including voiding times and amount.
3. If a post-void residual (PVR) test is ordered, it should be performed within a few minutes after a continent or incontinent void. Preferably, the volume of the void should be measured, but if it is an incontinent void, the amount of incontinence (i.e., small, moderate, large) should be recorded, along with the PVR volume. A residual volume that is not measured within a few minutes after a void is not helpful.
 - a. A normal PVR is less than 50 mL of urine remaining in the bladder after voiding and without straining. A PVR greater than 200 mL is abnormal. PVRs between 50 and 200 mL should be interpreted in the light of other clinical findings.
 - b. Where available, bladder ultrasound (performed by trained personnel) may be a less invasive alternative to urinary catheterization for determining PVR.

Bladder Rehabilitation/Bladder Training

1. Bladder rehabilitation/training may not be appropriate for the resident with cognitive impairment or those who are frail or dependent on staff for assistance with ADLs.
2. Residents with **urge** or **mixed incontinence** and who are cognitively intact are the best candidates for this program.
3. This technique requires that the resident resist or inhibit the sensation of urgency (the strong urge to void) in order to urinate according to a timetable.
4. If the resident is successful in inhibiting the urge to void, the time intervals between voiding can be increased. For example, if the resident feels the need to void every 15 minutes, encourage him or her to wait for 20 minutes. Try to increase the intervals by 10 to 15 minutes each week, in 5 minute increments.
5. The goal is for the resident to void every 2 to 3 hours. This may take several weeks.
6. Visual reminders of the timetable may be helpful for the resident.
7. Use positive reinforcement for delaying voiding and increasing intervals between voiding (praise, encouragement, etc.).

continues on next page

Pelvic Floor Muscle Rehabilitation/Exercises

1. Pelvic floor muscle exercises (PFMEs) are also known as Kegel exercises.
2. These exercises are helpful in dealing with **urge** and **stress incontinence**.
3. PFMEs strengthen the muscular components of urethral supports and are the cornerstone of noninvasive treatment of stress urinary incontinence.
4. PFMEs require residents who are able and willing to participate and the implementation of careful instructions and monitoring provided by the facility. Poor resident adherence to the exercises may occur even with close monitoring.
5. Review techniques of the exercises with the resident:
 - a. Instruct the resident to contract and hold the urethral and pelvic floor (pubococcygeal) muscles for 10 seconds, then relax for 10 seconds.
 - b. The resident should perform the exercises 30 to 80 times per day.
6. Establish a schedule for conducting the exercises and use visual aids to prompt residents and record progress.
7. Offer positive reinforcement for maintaining the exercise routine.

Toileting Plans

1. As indicated, and if the individual remains incontinent despite treating transient causes of incontinence and/or behavior modification, the staff will initiate a toileting plan.
2. As appropriate, based on assessing the category and causes of incontinence, the staff will provide scheduled toileting, prompted voiding, or other interventions to try to manage incontinence.
 - a. Toileting programs will start with a 3- to 5-day toileting assistance trial.
 - b. If the individual requires assistance from more than one person to transfer to the toilet, staff will address his or her mobility problems before attempting a toileting assistance trial.
 - c. Incontinence care should be individualized at night in order to maintain comfort and skin integrity, and minimize sleep disruption.
 - d. Prompted voiding is not helpful at night (e.g., between the hours of 10 p.m. and 5 a.m.) and has been shown to disrupt sleep.

Prompted Voiding

1. Prompted voiding is a technique appropriate for use with dependent or more cognitively impaired residents.
2. Prompted voiding techniques have been shown to reduce urinary incontinence episodes up to 40% for elderly incontinent nursing home residents, regardless of their type of urinary incontinence or cognitive deficit—provided that they at least are able to say their name or reliably point to one of two objects.
3. Prompted voiding has three components:
 - a. Regular monitoring with encouragement to report continence status;
 - b. Prompting to toilet on a scheduled basis; and
 - c. Praise and positive feedback when the resident is continent and attempts to toilet.
4. These methods require training, motivation and continued effort by the resident and caregivers to ensure continued success.
5. Prompted voiding focuses on teaching the resident to recognize bladder fullness or the need to void, to ask for help, or to respond when prompted to toilet.
6. Residents who are assessed with **urge** or **mixed incontinence** and are **cognitively impaired** may be candidates for prompted voiding.
7. As the resident's cognition changes, the facility should consider other factors, such as mobility, when deciding to conduct a voiding trial to determine feasibility of an ongoing toileting program.

continues on next page

Habit Training/Scheduled Voiding

1. Habit Training/Scheduled Voiding is a technique that calls for scheduled toileting at regular intervals on a planned basis to match the resident’s voiding habits.
2. Unlike bladder retraining, there is no systematic effort to encourage the resident to delay voiding and resist urges.
3. Habit training includes timed voiding with the interval based on the resident’s usual voiding schedule or pattern.
4. Scheduled voiding is timed voiding, usually every three to four hours while awake.
5. Residents who cannot self-toilet may be candidates for habit training or scheduled voiding programs.

Check and Change

1. If the resident does not respond and does not try to toilet, or for those with such severe cognitive impairment that they cannot either point to an object or say their own name, staff will use a “check and change” strategy.
2. A “check and change” strategy involves checking the resident’s continence status at regular intervals and using incontinence devices or garments. The primary goals are to maintain dignity and comfort and to protect the skin.

Documentation

1. The staff will document the results of behavioral/toileting trial in the resident’s medical record.
2. If the resident responds well, behavioral/toileting programs will be continued.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Catheter Care, Urinary

Level III

Purpose

The purpose of this procedure is to prevent catheter-associated urinary tract infections.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Following aseptic insertion of the urinary catheter, maintain a closed drainage system.
2. If breaks in aseptic technique, disconnection, or leakage occur, replace the catheter and collecting system using aseptic technique and sterile equipment, as ordered.

Input/Output

1. Observe the resident's urine level for noticeable increases or decreases. If the level stays the same, or increases rapidly, report it to the physician or supervisor.
2. Maintain an accurate record of the resident's daily output, per facility policy and procedure.

Maintaining Unobstructed Urine Flow

1. Check the resident frequently to be sure he or she is not lying on the catheter and to keep the catheter and tubing free of kinks.
2. Unless specifically ordered, do not apply a clamp to the catheter.
3. The urinary drainage bag must be held or positioned lower than the bladder at all times to prevent the urine in the tubing and drainage bag from flowing back into the urinary bladder.

Infection Control

1. Use standard precautions when handling or manipulating the drainage system.
2. Maintain clean technique when handling or manipulating the catheter, tubing, or drainage bag.
 - a. Do not clean the periurethral area with antiseptics to prevent catheter-associated UTIs while the catheter is in place. Routine hygiene (e.g., cleansing of the meatal surface during daily bathing or showering) is appropriate.
 - b. Be sure the catheter tubing and drainage bag are kept off the floor.
 - c. Empty the drainage bag regularly using a separate, clean collection container for each resident. Avoid splashing, and prevent contact of the drainage spigot with the nonsterile container.
 - d. Empty the collection bag at least every eight (8) hours.

Changing Catheters

1. Changing indwelling catheters or drainage bags at routine, fixed intervals is not recommended. Rather, it is suggested to change catheters and drainage bags based on clinical indications such as infection, obstruction, or when the closed system is compromised.
2. Ensure that the catheter remains secured with a leg strap to reduce friction and movement at the insertion site. (Note: Catheter tubing should be strapped to the resident's inner thigh.)

continues on next page

Complications

1. Observe the resident for complications associated with urinary catheters.
 - a. If the resident indicates that his or her bladder is full or that he or she needs to void (urinate), notify the physician or supervisor.
 - b. Check the urine for unusual appearance (i.e., color, blood, etc.).
 - c. Notify the physician or supervisor in the event of bleeding, or if the catheter is accidentally removed.
 - d. Report any complaints the resident may have of burning, tenderness, or pain in the urethral area.
 - e. Observe for other signs and symptoms of urinary tract infection or urinary retention. Report findings to the physician or supervisor immediately.

Managing Obstruction

1. If the catheter material is contributing to obstruction, notify the physician and change the catheter if instructed to do so.
2. Catheter irrigation may be ordered to prevent obstruction in residents at risk for obstruction.

Specimen Collection

1. If a small volume of urine is needed for urinalysis or culture, cleanse the port with a disinfectant and aspirate from the needless port using a sterile syringe or cannula adapter.
2. Obtain large volumes of urine for special analyses (not culture) aseptically from the drainage bag.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Wash basin;
2. Soap and water;
3. Washcloth;
4. Towel;
5. Bed protector; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. If the resident's physical or medical condition permits, assist the female resident into the dorsal recumbent position or the male resident into the supine position. Refer to the resident's plan of care and/or request information from the Nurse Supervisor regarding safe positioning for the resident.
5. Put on gloves.
6. Place bed protector under resident.
7. Wash the resident's genitalia and perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Pour wash water down the commode. Flush the commode.
9. Place soiled linen into designated container.
10. Put on clean gloves.

continues on next page

11. Remove gloves and discard into the designated container. Wash and dry your hands thoroughly.
12. Provide privacy. Cover the resident with a sheet, exposing only the perineal area.
13. With nondominant hand separate the labia of the female resident or retract the foreskin of the uncircumcised male resident. Maintain the position of this hand throughout the procedure.
14. Assess the urethral meatus.
15. **For a female resident:** Use a washcloth with warm water and soap to cleanse the labia. Use one area of the washcloth for each downward, cleansing stroke. Change the position of the washcloth with each downward stroke. Next, change the position of the washcloth and cleanse around the urethral meatus. Do not allow the washcloth to drag on the resident's skin or bed linen. With a clean washcloth, rinse with warm water using the above technique.
16. **For a male resident male:** Use a washcloth with warm water and soap to cleanse around the meatus. Cleanse the glans using circular strokes from the meatus outward. Change the position of the washcloth with each cleansing stroke. With a clean washcloth, rinse with warm water using the above technique. Return foreskin to normal position.
17. Use a clean washcloth with warm water and soap to cleanse and rinse the catheter from insertion site to approximately four inches outward.
18. Secure catheter utilizing a leg band.
19. Check drainage tubing and bag to insure that the catheter is draining properly.
20. Discard disposable items into designated containers. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. Clean wash basin and return to designated storage area.
24. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
25. Wash and dry your hands thoroughly.
26. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time that catheter care was given.
2. The name and title of the individual(s) giving the catheter care.
3. All assessment data obtained when giving catheter care.
4. Character of urine such as color (straw-colored, dark, or red), clarity (cloudy, solid particles, or blood), and odor.
5. Any problems noted at the catheter-urethral junction during perineal care such as drainage, redness, bleeding, irritation, crusting, or pain.
6. Any problems or complaints made by the resident related to the procedure.
7. How the resident tolerated the procedure.
8. If the resident refused the procedure, the reason(s) why and the intervention taken.
9. The signature and title of the person recording the data.

continues on next page

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Catheter Irrigation, Open System

Level III

Purpose

The purpose of this procedure is to maintain patency of the catheter.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Change the urinary drainage tubing as necessary.
2. Determine if the resident is on intake and output.
3. Check the urine for unusual appearance. Record findings.
4. Cleanse the urethral meatus and adjacent areas daily.
5. Notify the physician immediately in the event of hemorrhage or if the catheter is pulled out.
6. Maintain an accurate record of the resident's daily fluid intake and output, if indicated.
7. Provide perineal care to the incontinent resident to prevent skin rashes and breakdown.
8. Unless specifically ordered by the physician, do not apply a clamp to any catheter.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sterile catheter irrigation tray;
2. Prescribed irrigation solution at room temperature;
3. Medication (if ordered);
4. Alcohol wipe;
5. Sterile drape; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Position the resident so the catheter is accessible.
4. Open the sterile irrigation tray using sterile technique.
5. Pour 100 mLs of the prescribed irrigation solution into the sterile solution container.
6. Put on sterile gloves.
7. Place the sterile drape under the catheter.
8. Place the sterile collection basin under the catheter on the sterile drape.
9. Draw 30 mLs of the prescribed solution into the irrigating syringe.
10. Disconnect the catheter from the drainage tubing. Cover the open end of the drainage tubing with the sterile protector cap. Position capped tubing so that it remains coiled on the bed surface.

continues on next page

11. Insert the syringe into the catheter and slowly instill the solution.
12. Remove the syringe and allow the catheter to drain into the sterile collection basin via gravity. Repeat until all of the solution has been used or until the flow returns easily.
13. Remove the protector cap, clean the end of the drainage tubing with an alcohol wipe, and reconnect tubing to the catheter.
14. Discard disposable items into designated containers. Remove gloves and discard into designated container.
15. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
16. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The amount of solution used to irrigate, the amount returned as drainage, and the amount of urine drained.
4. The character and color of urine/drainage.
5. Any observation of obstruction; evidence of blood, pus; presence of sediment; change in output, amount, or color; patency of the catheter, etc.).
6. Any change in the resident’s condition (i.e., swelling, discomfort, etc.).
7. Any problems or complaints made by the resident related to the procedure.
8. The resident’s response to the treatment.
9. All assessment data obtained during the procedure.
10. If the resident refused the procedure, the reason(s) why and the intervention taken.
11. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormal findings (i.e., obstruction, evidence of blood, change in output, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Catheterization, Intermittent, Female Resident

Level III

Purpose

The purpose of this procedure is to provide guidelines for the aseptic insertion of an intermittent catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Determine if the resident is on intake or output before discarding urine.
2. Check the urine for unusual appearance. Record findings.
3. If a bladder training program is being implemented, observe and record the resident's voiding pattern to assist in establishing a training schedule.
4. If lighting is inadequate, place a lamp next to the resident's bed while performing the procedure.
5. Use the smallest catheter possible, consistent with good drainage, to minimize urethral trauma.
6. Maintain an accurate record of the resident's daily fluid intake and output, if indicated.
7. Provide perineal care to the incontinent resident to prevent skin rashes and breakdown.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sterile catheterization tray; which may include some or all of the following:
 - a. Specimen container (if ordered);
 - b. Medication (if ordered);
 - c. Cotton balls;
 - d. Antiseptic solution;
 - e. Sterile towels;
 - f. Underpad;
 - g. Sterile forceps;
 - h. Lubricant;
 - i. Bath blanket, if indicated;
 - j. Fenestrated towel;
 - k. Wash basin;
 - l. Wash cloth;
 - m. Soap and water; and
 - n. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. If the resident's physical or medical condition permits, assist the resident into the dorsal recumbent position with her knees flexed and separated. Refer to the resident's plan of care and/or request information from the nurse supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
7. Wash the resident's genitalia and perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Pour the wash water down the commode. Flush the commode.
9. Discard soiled linen into designated container.
10. Discard disposable gloves into designated container. Wash and dry your hands thoroughly.
11. Open the catheter tray using sterile technique.
12. Put on sterile gloves.
13. Position sterile drape under buttocks of resident.
14. Place fenestrated drape over the perineum.
15. Organize the items on the sterile field. Pour antiseptic solution over the cotton balls. Lubricate the catheter tip about two inches.
16. Place sterile tray onto sterile drape between the resident's thighs.
17. With nondominant hand, separate the labia. Maintain the position of this hand throughout the procedure.
18. Assess the urethral meatus.
19. Use the forceps and cotton balls to cleanse around the meatus. Use only one cotton ball for each downward, cleansing stroke. Next, cleanse around the urethral meatus.
20. With your sterile hand, pick up the catheter approximately 3-5 inches from the tip.
21. Insert the catheter gently into the meatus (approximately 2-3 inches) until urine begins to flow from the bladder. Place the end of the catheter into the sterile container used to measure output and/or to collect the urine specimen.
22. When urine flow ceases, pinch the catheter and remove the catheter gently and slowly. Dry the perineum.
23. Flush urine (if not retained for specimen collection) into the commode.
24. Dry resident's perineal area.
25. Discard all disposable items into designated containers.
26. Clean and sanitize measuring device if reusable. Store in designated area.
27. Clean wash basin and return to designated storage area.
28. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
29. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
30. Wash and dry your hands thoroughly.
31. Reposition the bed covers. Make the resident comfortable.
32. Place the call light within easy reach of the resident.
33. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

continues on next page

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The amount of urine drained.
4. The character, clarity, and color of urine.
5. Any observation of obstruction; evidence of blood, pus, etc.
6. Any change in the resident’s condition (e.g., swelling, discomfort, etc.).
7. Any problems or complaints made by the resident related to the procedure.
8. The resident’s response to the treatment.
9. All assessment data obtained during the procedure.
10. If the resident refused the procedure, the reason(s) why and the intervention taken.
11. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities (i.e., urine output greater than 800ml, obstruction of catheter, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Catheterization, Intermittent, Male Resident

Level III

Purpose

The purpose of this procedure is to provide guidelines for the aseptic insertion of an intermittent catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Determine if the resident is on intake or output before discarding the urine.
2. Check the urine for unusual appearance. Record findings.
3. If a bladder training program is being implemented, observe and record the resident's voiding pattern to assist in establishing a training schedule.
4. If lighting is inadequate, place a lamp next to the resident's bed while performing the procedure.
5. Use the smallest catheter possible, consistent with good drainage, to minimize urethral trauma.
6. Maintain an accurate record of the resident's daily fluid intake and output, if indicated.
7. Provide perineal care to the incontinent resident to prevent skin rashes and breakdown.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Sterile catheterization tray; which may include some or all of the following:
 - a. Specimen container (if ordered);
 - b. Medication (if ordered);
 - c. Cotton balls;
 - d. Antiseptic solution;
 - e. Sterile towels;
 - f. Underpad;
 - g. Sterile forceps;
 - h. Lubricant;
 - i. Bath blanket;
 - j. Fenestrated towel;
 - k. Wash basin;
 - l. Wash cloth;
 - m. Soap and water; and
 - n. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

continues on next page

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. If the resident's physical or medical condition permits, assist the resident into the supine position. Refer to the resident's plan of care and/or request information from the nurse supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
7. Wash the resident's genitalia and perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Pour the wash water down the commode. Flush the commode.
9. Discard soiled linen into designated container.
10. Discard disposable gloves into designated container. Wash and dry your hands thoroughly.
11. Open the catheter tray using sterile technique.
12. Put on sterile gloves.
13. Position sterile drape over thighs just below penis.
14. Place fenestrated drape over penis.
15. Organize the items on the sterile field. Pour antiseptic solution over the cotton balls. Lubricate the catheter tip about 5-7 inches.
16. Place sterile tray onto sterile drape on the resident's thighs.
17. If resident is not circumcised retract foreskin with nondominant hand. Hold penis just below glans. Retract meatus between thumb and forefinger. (Note: This glove is now contaminated.)
18. Using the forceps, pick up a cotton ball and cleanse the penis. Clean in a circular motion from the meatus to the base of the glans. Repeat three times using a clean cotton ball each time. (Note: Keep the hand that has not touched the perineum sterile.)
19. Lift the penis to a position perpendicular to the resident's body.
20. With your sterile hand pick up the catheter approximately 3-5 inches from the tip.
21. Insert the catheter gently into the meatus (approximately 5-7 inches) until urine begins to flow from the bladder. When urine begins to flow advance the catheter another 2 inches.
22. If slight resistance is met, instruct the resident to take a slow deep breath to relax the perineal muscles and overcome resistance to entry. If resistance continues, do not force the entry. Stop the procedure and notify your supervisor.
23. Collect the specimen (if ordered) directly into the specimen container. (Note: Do not remove more than 800 mL of urine at one time.)
24. Pinch the catheter when the urine flow ceases. Remove the catheter gently and slowly. Dry the perineum.
25. Flush urine (if not retained for specimen collection) into the commode.
26. Dry resident's perineal area.
27. Discard all disposable items into designated containers.
28. Clean and sanitize measuring device if reusable. Store in designated area.
29. Clean wash basin and return to designated storage area.
30. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.

continues on next page

31. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
32. Wash and dry your hands thoroughly.
33. Reposition the bed covers. Make the resident comfortable.
34. Place the call light within easy reach of the resident.
35. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The amount of urine drained.
4. The character, clarity, and color of urine.
5. Any observation of obstruction; evidence of blood, pus, etc.
6. Any change in the resident’s condition (e.g., swelling, discomfort, etc.).
7. Any problems or complaints made by the resident related to the procedure.
8. The resident’s response to the treatment.
9. All assessment data obtained during the procedure.
10. If the resident refused the procedure, the reason(s) why and the intervention taken.
11. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities (i.e., urine output of 800 mL, obstruction, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Catheterization, Residual Use

Level III

Purpose

The purpose of this procedure is to assess the amount of urine left in the bladder after a resident voids.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Straight catheter tray; *
2. Cotton balls;
3. Antiseptic solution;
4. Sterile towels;
5. Sterile forceps;
6. Lubricant;
7. Fenestrated towel;
8. Straight catheter (size ordered by physician);
9. Wash basin;
10. Washcloth;
11. Soap and water; and
12. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

* Most of the equipment/supplies listed above are contained in the straight catheter tray. However, they are listed individually because there may be times when you will need to obtain and assemble such supplies without the benefit of a straight catheter tray.

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Allow resident to void and assist resident back to bed.
4. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
5. If the resident's physical or medical condition permits, assist the female resident into the dorsal recumbent position or the male resident into the supine position. Refer to the resident's plan of care and/or request information from the nurse supervisor regarding safe positioning for the resident.
6. Put on disposable gloves.
7. Wash the resident's genitalia and perineum thoroughly with soap and water. Rinse the area well and towel dry.

continues on next page

8. Pour the wash water down the commode. Flush the commode.
9. Discard soiled linen into designated container.
10. Discard disposable gloves into designated container. Wash and dry your hands thoroughly.
11. Open the straight catheter tray using sterile technique.
12. Put on sterile gloves.
13. Position sterile drape under buttocks of resident.
14. Place fenestrated drape over the perineum.
15. Open the antiseptic solution and pour it over the cotton balls. Open the antiseptic ointment and lubricate the catheter tip about two inches for the female resident and five inches for the male resident.
16. Place sterile tray onto sterile drape between the resident's thighs.
17. With nondominant hand separate the labia of the female resident or retract the foreskin of the uncircumcised male resident. Maintain the position of this hand throughout the procedure. (Note: This glove is now contaminated.)
18. Assess the urethral meatus.
19. **For a female resident:** Use the forceps and cotton balls to cleanse the labia. Use only one cotton ball for each downward, cleansing stroke. Next, cleanse around the urethral meatus. Using a new cotton ball, cleanse directly over the meatus.
20. **For a male resident:** Use the forceps and cotton balls to cleanse around the meatus. Cleanse the glans using circular strokes from the meatus outward. Repeat three times. Use only one cotton ball per cleansing stroke. Return foreskin to normal position.
21. With your sterile hand, pick up the sterile straight catheter approximately 5-6 inches from the tip.
22. Insert the catheter gently into the meatus (approximately 2-3 inches in a female or 5-6 inches in a male) until urine begins to flow from the bladder. Place the end of the straight catheter into a measuring device. When the urine flow begins to cease, pinch the catheter and remove.
23. Discard straight catheter and disposable items into designated containers.
24. Note amount of residual urine collected.
25. Flush residual urine into the commode.
26. Clean and sanitize measuring device if reusable. Store in designated area.
27. Dry resident's perineal area.
28. Remove gloves and discard into designated container.
29. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
30. Wash and dry your hands thoroughly.
31. Reposition the bed covers. Make the resident comfortable.
32. Place the call light within easy reach of the resident.
33. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The amount of residual urine obtained.

continues on next page

7. The character (i.e., color, clarity, etc.) of the residual urine obtained.
8. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of the amount of residual urine, if any, and if there are any abnormalities in the character of the urine.
3. Report other information in accordance with facility policy and professional standards of practice.

Emptying a Urinary Drainage Bag

Purpose

The purposes of this procedure are to prevent the drainage bag from becoming full and allowing urine to flow back into the bladder, to measure output, and to obtain a sterile specimen.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Empty the urinary drainage bag at least every eight (8) hours or more often if needed to keep the bag from becoming full.
2. Empty only one urinary drainage bag at a time using a clean and separate measuring container for each resident.
3. Do not allow the drain spout to come into contact with the measuring container, hands, or any other object. (**Note:** If accidental contamination occurs, wipe the drain spout with an alcohol sponge or swab.)
4. Always check the tubing when emptying a urinary drainage bag to be sure there are no kinks and that the urine is draining freely.
5. Observe the character of the urine such as color (straw-colored, dark, or red), clarity (cloudy, solid particles, or blood), and odor.
6. Always attach the drainage bag to the bedframe—never to the side rails.
7. Never disconnect the drainage bag from the catheter.
8. Keep the drainage bag below the level of the resident's bladder.
9. Keep the drainage bag and tubing off the floor at all times to prevent contamination and damage.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Plastic, metal or glass measuring container (calibrated);
2. Alcohol sponge or swab;
3. Paper and pencil/pen;
4. Intake and output record;
5. Paper towels; and
6. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Place a paper towel on the floor beneath the drainage bag.

continues on next page

5. Position the measuring container under the drainage bag.
6. Remove the drain tube from its holder.
7. Open the drainage bag and let the urine flow into the measuring container.
8. After the drainage bag has emptied, close the drain.
9. Wipe the drain with an alcohol sponge or swab. Discard the sponge or swab into the designated container.
10. Replace the drain tube back into its holder.
11. Measure and record the urinary output, if indicated.
12. Pour urine down the commode. Flush the commode.
13. Rinse out the measuring container and return to its designated storage area.
14. Discard all disposable items into designated containers.
15. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
16. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
17. Wash and dry your hands thoroughly.
18. Reposition the bed covers. Make the resident comfortable.
19. Place the call light within easy reach of the resident.
20. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The amount of urine emptied from the drainage bag.
3. Kinks in the tubing that cannot be corrected by simple repositioning.
4. Leaking of urine from the tubing.
5. Lack of urine drainage through the tubing.
6. Character of urine such as color (straw-colored, dark, or red), clarity (cloudy, solid particles, or blood), and odor.
7. How the resident tolerated the procedure.
8. If the resident refused the procedure, the reason(s) why and the intervention taken.
9. All assessment data obtained during the procedure.
10. The name and title of the individual(s) who performed the procedure.

Reporting

1. Notify the supervisor if the resident refuses the procedure, or if there is leaking of urine from the tubing.
2. Notify the physician if there is any sediment in urine or if the urine has a strong odor.
3. Report other information in accordance with facility policy and professional standards of practice.

External Male Catheter (Condom Catheter)

Level III

Purpose

The purpose of this procedure is to prevent urinary tract infection and skin breakdown in an incontinent resident.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Condom catheter in size appropriate for resident;
2. Urinary drainage bag;
3. Towel;
4. Wash cloth;
5. Soap and water;
6. Wash basin; and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. If the resident's physical or medical condition permits, assist the resident into the semi-fowler's position. Refer to the resident's plan of care and/or request information from the Nurse Supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
7. Wash the resident's perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Place the condom catheter on the resident's penis and roll the condom catheter down. (**Note:** If the male is uncircumcised be sure the foreskin is pulled down over the head of the penis.)
9. Attach the urinary drainage bag to the tubing.
10. Pour the wash water down the commode. Flush the commode.
11. Discard soiled linen into designated container.
12. Discard disposable items into designated container.
13. Clean and sanitize wash basin and store in designated area.
14. Remove disposable gloves and discard in designated container. Wash and dry your hands thoroughly.
15. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.

continues on next page

16. Wash and dry your hands thoroughly.
17. Reposition the bed covers. Make the resident comfortable.
18. Place the call light within easy reach of the resident.
19. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The size of the condom catheter used.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Foley Catheter Insertion, Female Resident

Level III

Purpose

The purpose of this procedure is to provide guidelines for the aseptic insertion of a urinary catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Foley catheter tray (size specified in the order), which includes some or all of the following:
 - a. Drainage bag/kit;
 - b. Specimen container (if ordered);
 - c. Medication (if ordered);
 - d. Cotton balls;
 - e. Antiseptic solution;
 - f. Sterile towels;
 - g. Underpad;
 - h. Sterile forceps;
 - i. Lubricant;
 - j. Bath blanket, if indicated;
 - k. Fenestrated towel;
 - l. Wash basin;
 - m. Wash cloth;
 - n. Soap and water;
 - o. Prefilled 5 mL syringe with normal saline (without needle);
 - p. Scissors;
 - q. Sterile specimen container;
 - r. Adhesive tape; and
 - s. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.

continues on next page

4. If the resident's physical or medical condition permits, assist the resident into the dorsal recumbent position with her knees flexed and separated. Refer to the resident's plan of care and/or request information from the Nurse Supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
7. Wash the resident's genitalia and perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Pour the wash water down the commode. Flush the commode.
9. Discard soiled linen into designated container.
10. Discard disposable gloves into designated container. Wash and dry your hands thoroughly.
11. If drainage bag is packaged separately, open package and attach bag to the bed frame. Allow tubing to rest on bed surface.
12. Open the catheter tray using sterile technique.
13. Put on sterile gloves.
14. Position sterile drape under buttocks of resident.
15. Place fenestrated drape over the perineum.
16. Organize the items on the sterile field. Pour antiseptic solution over the cotton balls. Lubricate the catheter tip about two inches. Attach prefilled syringe to the intake lumen of the catheter and instill the fluid to insure that the balloon inflates properly. Then, aspirate all of the fluid back into the syringe and leave attached to the catheter.
17. Place sterile tray onto sterile drape between the resident's thighs.
18. Separate the labia with the thumb and forefinger of your nondominant hand to expose the meatus. (Note: This glove is now contaminated.)
19. Using the forceps, pick up a cotton ball and cleanse the perineum with the antiseptic solution. Cleanse in a downward stroke on each side of the meatus. Use only one cotton ball for each stroke. (Note: Keep the hand that has not touched the perineum sterile.)
20. Using a third cotton ball, cleanse directly over the meatus.
21. With your sterile hand pick up the catheter approximately 3-5 inches from the tip.
22. Insert the catheter gently into the meatus (approximately 2-3 inches) until urine begins to flow from the bladder. When urine begins to flow advance the catheter another 2-3 inches. Inflate balloon with 5mL of normal saline and remove syringe. Pull gently on catheter to check placement.
23. If slight resistance is met, instruct the resident to take a slow deep breath to relax the perineal muscles and overcome resistance to entry. If resistance continues, do not force the entry. Stop the procedure and notify your supervisor.
24. Collect the specimen (if ordered) directly into the specimen container. (Note: Do not remove more than 800 mL of urine at one time.)
25. Attach catheter to drainage tubing. Tape catheter to inner thigh or secure with leg band. Secure drainage tubing to bottom bed sheet with clip from drainage set.
26. Discard all disposable items into designated containers.
27. Clean wash basin and return to designated storage area.
28. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
29. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
30. Wash and dry your hands thoroughly.
31. Reposition the bed covers. Make the resident comfortable.
32. Place the call light within easy reach of the resident.

continues on next page

33. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data (e.g., character, color, clarity, etc.) obtained during the procedure.
4. The size of the Foley catheter inserted and the amount of fluid used to inflate the balloon.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities (i.e., bleeding, obstruction, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Foley Catheter Insertion, Male Resident

Level III

Purpose

The purpose of this procedure is to provide guidelines for the aseptic insertion of a urinary catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Foley catheter tray (size specified in the order), which includes some or all of the following:
 - a. Drainage bag/kit;
 - b. Specimen container (if ordered);
 - c. Medication (if ordered);
 - d. Cotton balls;
 - e. Antiseptic solution;
 - f. Sterile towels;
 - g. Underpad;
 - h. Sterile forceps;
 - i. Lubricant;
 - j. Bath blanket, if indicated;
 - k. Fenestrated towel;
 - l. Wash basin;
 - m. Wash cloth;
 - n. Soap and water;
 - o. Prefilled 5mL syringe with normal saline (without needle);
 - p. Scissors;
 - q. Sterile specimen container;
 - r. Adhesive tape; and
 - s. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.

continues on next page

4. If the resident's physical or medical condition permits, assist the resident into the supine position. Refer to the resident's plan of care and/or request information from the Nurse Supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
7. Wash the resident's perineum thoroughly with soap and water. Rinse the area well and towel dry.
8. Pour the wash water down the commode. Flush the commode.
9. Discard soiled linen into designated container.
10. Discard disposable gloves into designated container. Wash and dry your hands thoroughly.
11. If drainage bag is packaged separately, open package and attach bag to the bed frame. Allow tubing to rest on the bed surface.
12. Open the catheter tray using sterile technique.
13. Put on sterile gloves.
14. Position sterile drape over thighs just below penis.
15. Place fenestrated drape over penis.
16. Organize the items on the sterile field. Pour antiseptic solution over the cotton balls. Lubricate the catheter tip about 5-7 inches. Attach prefilled syringe to the intake lumen of the catheter and instill the fluid to insure that the balloon inflates properly. Then, aspirate all of the fluid back into the syringe and leave attached to the catheter.
17. Place sterile tray onto sterile drape on the resident's thighs.
18. If resident is not circumcised retract foreskin with nondominant hand. Hold penis just below glans. Retract meatus between thumb and forefinger. (**Note:** This glove is now contaminated.)
19. Using the forceps, pick up a cotton ball and cleanse the penis. Clean in a circular motion from the meatus to the base of the glans. Repeat three times using a clean cotton ball each time. (**Note:** Keep the hand that has not touched the perineum sterile.)
20. Lift the penis to a position perpendicular to the resident's body.
21. With your sterile hand pick up the catheter approximately 3-5 inches from the tip.
22. Insert the catheter gently into the meatus (approximately 5-7 inches) until urine begins to flow from the bladder. When urine begins to flow, advance the catheter another 2 inches. Inflate balloon slowly with 5mL normal saline. If resident complains of any pain or pressure while inflating the balloon, stop, deflate the balloon and advance the catheter another inch. Inflate the balloon slowly. If the resident complains of any pain or pressure, stop, deflate the balloon and call for assistance. Remove syringe after successfully inflating the balloon. Pull gently on catheter to check placement.
23. If slight resistance is met, instruct the resident to take a slow deep breath to relax the perineal muscles and overcome resistance to entry. If resistance continues, do not force the entry. Stop the procedure and notify your supervisor.
24. Collect the specimen (if ordered) directly into the specimen container. (**Note:** Do not remove more than 800 mL of urine at one time.)
25. Attach catheter to drainage tubing. Tape catheter to top of thigh or lower abdomen. Secure drainage tubing to bottom bed sheet with clip from drainage set.
26. Discard all disposable items into designated containers.
27. Clean wash basin and return to designated storage area.
28. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
29. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
30. Wash and dry your hands thoroughly.
31. Reposition the bed covers. Make the resident comfortable.

continues on next page

32. Place the call light within easy reach of the resident.
33. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data (e.g., character, color, clarity, etc.) obtained during the procedure.
4. The size of the Foley catheter inserted and the amount of fluid used to inflate the balloon.
5. How the resident tolerated the procedure.
6. If the resident refused the procedure, the reason(s) why and the intervention taken.
7. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities (i.e., bleeding, obstruction, etc.).
3. Report other information in accordance with facility policy and professional standards of practice.

Foley Catheter Removal

Level III

Purpose

The purpose of this procedure is to provide guidelines for the approved method of removing a foley catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Determine if the resident is on intake or output before discarding urine.
2. Culture indwelling catheter tips when changed or discontinued, as indicated by a physician's order.
3. Verify by the resident's medical record the size of the catheter balloon to ensure the aspiration of all fluid before removal of the catheter.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure.

1. Specimen container (if ordered);
2. Medication (if ordered);
3. 5 mL syringe (without needle); and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Assist the resident into the supine position.
4. Put on disposable gloves.
5. Fold the top covers down to the foot of the bed. Place a sheet (folded once) across the resident's chest. Avoid unnecessary exposure of the resident's body.
6. Obtain urine specimen, if ordered.
7. Remove tape or leg band used to secure tubing. Cleanse skin of any tape residue.
8. Insert the hub of a 5mL syringe in the intake lumen of the catheter and aspirate all of the fluid used to inflate the balloon.
9. Gently and slowly withdraw the catheter completely.
10. Clip the tip of the catheter tube, place it into the sterile specimen container, and close the container (with physician's order).
11. Measure urine and pour down commode. Flush the commode. Discard catheter, drainage tubing, and drainage bag into designated container.

continues on next page

12. Discard all disposable items into designated containers.
13. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
14. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
15. Wash and dry your hands thoroughly.
16. Reposition the bed covers. Make the resident comfortable.
17. Place the call light within easy reach of the resident.
18. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.
19. Send catheter tip to lab for a routine culture (with physician's order).
20. Wash and dry your hands thoroughly.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data (e.g., character, color, clarity, etc.) obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Report other information in accordance with facility policy and professional standards of practice.

Hemodialysis Access Care

Level III

Purpose

Hemodialysis devices may only be accessed by medical personnel who have received training and demonstrated clinical competency regarding use of these devices.

Guidelines

1. Verify with state Nurse Practice Act regulations regarding scope of practice for licensed staff in the care of residents with hemodialysis access devices.
2. Hemodialysis access devices are surgically placed and removed.
3. Vascular access may be accomplished in one of three ways:
 - a. Arterio-venous fistula (AVF)
 - b. Arterio-venous graft (AVG)
 - c. Central catheters

Arterio-Venous Fistula

1. AVF is the preferred method of vascular access.
2. Access is created by surgically connecting an artery and a vein.
3. The AVF is usually placed in the arm.
4. The use of an AVF creates a lower risk of complications from clotting or infections.
5. An AVF provides longer lasting and better blood flow than grafts.
6. Sometimes veins are too weak for this access.

Arterio-Venous Graft

1. The AVG uses a synthetic or animal-derived tubing to connect the artery and vein.
2. The arm is the preferred site but the graft may also be placed in the leg.

Central Catheters

1. Central catheters for hemodialysis are generally inserted in the neck, chest or groin area.
2. This is not the preferred site for long-term placement. There is more risk of clotting and infection than with either fistulas or grafts. Central dialysis catheters are used for short term dialysis (less than three weeks) while AVF or AVG is healing.
3. Central dialysis catheters are recognized by the following characteristics:
 - a. There are two catheters exiting from the insertion site. The lumen of the arterial catheter is usually **RED** and the lumen of the venous catheter is usually **BLUE**.
 - b. The lumens are short and made from heavy thick rubber. This is so they can withstand high pressure volumes **from** the dialysis machine.
 - c. There are clamps **on** the lumens.

General Equipment and Supplies

No equipment is needed on general medical floor. Only dialysis center will need equipment.

continues on next page

Steps in the Procedure

Care of AVFs and AVGs

1. After placement of the fistula or graft, the site cannot be accessed until it matures. This may take 2-3 weeks for a graft and 6-12 weeks for a fistula.
2. The site may not be used for dialysis until a written order is received from the nephrologist or surgeon.
3. Care involves the primary goals of preventing infection and maintaining patency of the catheter (preventing clots).
4. To prevent infection and/or clotting:
 - a. Keep the access site clean at all times.
 - b. Do not use the access site arm to take blood samples, administer IV fluids or give injections.
 - c. Needle access for hemodialysis should be rotated (alert the DNS if it is noted that the same site is accessed repeatedly).
 - d. Check for signs of infection (warmth, redness, tenderness or edema) at the access site when performing routine care and at regular intervals.
 - e. Do not use the access arm to take blood pressure.
 - f. Advise the resident not to sleep on, wear tight jewelry or lift heavy objects with the access arm.
 - g. Check the color and temperature of the fingers, and the radial pulse of the access arm when performing routine care and at regular intervals.
 - h. Check patency of the site at regular intervals. Palpate the site to feel the “thrill,” or use a stethoscope to hear the “whoosh” or “bruit” of blood flow through the access.

Care Immediately Following Dialysis Treatment

1. The dressing change is done in the dialysis center post-treatment.
2. If dressing becomes wet, dirty, or not intact, the dressing shall be changed by a licensed nurse trained in this procedure. (Note: Check with State Nurse Practice Act to determine licensure and competency requirements.)
3. Mild bleeding from site (post-dialysis) can be expected. Apply pressure to insertion site and contact dialysis center for instructions.
4. If there is major bleeding from site (post-dialysis), apply pressure to insertion site and contact emergency services and dialysis center. Verify that **clamps are closed** on lumens. This is a **medical emergency. Do not leave resident alone until emergency services arrive.**

Care of Central Dialysis Catheters

1. The central catheter site must be kept clean and dry at all times. Bathing and showering are not permitted with this device.
2. Catheter lumens should be capped and clamped when not in use.
3. Dialysis catheters should be marked *for dialysis use only* so they are not confused with central venous access devices.
4. Flushing, drawing blood or administering medications via central hemodialysis catheters require specialized training and/or certification of an RN. Do not allow non-dialysis personnel to access the catheter.
5. Those caring for the catheter site must wear a mask and gloves when doing so. Dressing changes, if ordered, should be done using sterile technique.
6. Never pull or tug on the catheter. Do not use scissors near the catheter.

continues on next page

Documentation

The general medical nurse should document in the resident’s medical record every shift as follows:

1. Location of catheter.
2. Condition of dressing (interventions if needed).
3. If dialysis was done during shift.
4. Any part of report from dialysis nurse post-dialysis being given.
5. Observations post-dialysis.

Nephrostomy Tube, Care of

Level III

Purpose

The purpose of this procedure is to provide guidelines for the care of the resident with a percutaneous nephrostomy tube.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble equipment and supplies as necessary.

General Guidelines

1. Assess the resident for indications of bleeding in the flank area every 4 hours x 2 after insertion of the nephrostomy tube, then every 8 hours.
2. Check placement of the tubing and integrity of the tape during assessments.
 - a. Drainage should be below the level of the kidneys.
 - b. There should be no kinks in the tubing.
 - c. If the tubing is dislodged, cover stoma with sterile 4x4 and notify the Attending Physician immediately.
3. Empty drainage bag once per shift and as needed.
4. Change drainage bag monthly, or as needed.
5. Measure output as follows:
 - a. Initially every hour x 4 hours; then
 - b. Every 4 hours x 24 hours; then
 - c. Every 8 hours.
6. Measure output from the right and left kidneys separately. (Record urinary and nephrostomy output separately.)
7. After nephrostomy tube insertion, output may be bloody but should change to light pink within 24 hours.
8. Change dressings every 1-3 days, or as ordered.
9. Use sterile technique during dressing changes.

Equipment and Supplies

For Dressing Changes:

1. Sterile 4x4 drain dressings;
2. Povidone-iodine swabs;
3. Sterile saline/4x4 gauze/sterile basin/forceps if NSS is ordered;
4. Clean gloves;
5. Sterile gloves;
6. Adhesive tape;
7. Disposable underpad;
8. Sterile drape; and
9. Waste bag.

continues on next page

For Irrigation:

1. Sterile 4x4 gauze pads;
2. Clean gloves;
3. Sterile gloves;
4. 3 mL syringes pre-filled with sterile saline solution;
5. Adapter (male);
6. Alcohol or povidone-iodine swabs;
7. Sterile cups (2); and
8. Disposable waste bag.

Steps in the Procedure

1. Wash and dry your hands.
2. Assemble all the equipment on the resident's overbed table.
 - a. Open the sterile drape and create the sterile field.
 - b. Open several packages of gauze pads.
 - c. Open several packages of povidone-iodine swabs.
 - d. Open the disposable waste bag and place it away from the sterile field.
3. Explain the procedure to the resident.
4. Provide privacy for the resident.

Dressing Changes:

1. Position the resident on the side opposite of the tube.
2. Place the underpad beneath the resident.
3. Wash your hands and put on clean gloves.
4. Carefully remove the wet or soiled dressing.
5. Discard the dressing in the disposable waste bag.
6. Observe the dressing site for signs of skin breakdown, infection, or drainage.
7. Remove gloves and discard in the disposable waste bag.
8. Wash and dry your hands.
9. Put on sterile gloves.
10. With iodine swab (or 4x4 dipped in NSS if ordered), cleanse the nephrostomy tube site in outward circles from the insertion site. Use a new swab for each circle. Cleanse outward to approximately 3 inches in diameter from the insertion site.
11. Discard soiled swabs in disposable waste bag.
12. Allow iodine/saline solution to dry.
13. Place 1-2 sterile drain dressings on the nephrostomy tube site, as indicated. Secure with adhesive tape.
14. Secure the tube with tape to prevent tension.
15. Remove underpad and discard soiled material.
16. Remove gloves and wash your hands.
17. Assist the resident to a comfortable position.
18. Place call light within reach of the resident.

Irrigation:

1. Position the resident on the side opposite of the tube.
2. Place the underpad beneath the resident.

continues on next page

3. Open gauze pads, iodine or alcohol swabs, and pre-filled syringe.
4. Wash your hands and put on sterile gloves.
5. Cleanse the junction between the nephrostomy tube and the drainage tube with iodine or alcohol swabs.
6. Disconnect the tubes and place the ends of both tubes in sterile cups.
7. Connect the syringe to the nephrostomy tube using a male adapter, if necessary.
8. Slowly instill 2-3 mL of saline into the nephrostomy tube. **Do not irrigate with more than 3 mL of saline.**
9. Slowly aspirate the saline back into the syringe. If there is resistance, remove the syringe and reattach the nephrostomy tube to the drainage tube and allow the solution to drain by gravity.

Documentation

The following information should be recorded in the resident’s medical record.

1. The date and time the procedure was performed.
2. Name and title of the person(s) who performed the procedure.
3. The resident’s response to the procedure.
4. Assessment data obtained during the procedure:
 - a. Color, quality and amount of drainage (or irrigation output);
 - b. Signs and symptoms of infections (pus, redness, swelling, tenderness);
 - c. Signs of tube obstruction;
 - d. Signs of skin breakdown around the dressing site; and
 - e. Any problems or complaints from the resident during the procedure.

Reporting

Report any of the following signs or symptoms to the physician:

1. Redness, inflammation, reports of pain, or other signs of infection at the insertion site;
2. Reduced output or output below established parameters;
3. Inability to irrigate tube or signs of obstruction of the tube;
4. Signs of skin breakdown around the dressing site; or
5. If the tube becomes dislodged.

Version	1.1 (H5MAPR0304)

Peritoneal Dialysis (Continuous Ambulatory)

Level III

Purpose

The purpose of this procedure is to provide continuous ambulatory peritoneal dialysis that is safe and consistent with physician orders and instructions from the contracted dialysis facility.

Preparation

1. This procedure must be performed by a nurse who has been specifically trained in peritoneal dialysis procedures, complications, and infection control for dialysis.
2. Review all existing orders and instructions for care pertaining to the resident's dialysis. Verify the following:
 - a. Dialysate solution/concentration;
 - b. Medication(s) to be added;
 - c. Number of exchanges and infusion, dwell, and drain times;
 - d. Monitoring parameters; and
 - e. Lab Orders.

General Guidelines

1. Monitor the resident for the following problems associated with renal failure and/or dialysis:
 - a. Fluid and electrolyte imbalance;
 - b. Cardiovascular/hemodynamic instability;
 - c. Pain;
 - d. Infection;
 - e. Altered nutrition; and
 - f. Immobility.
2. Maintain strict asepsis when adding medications to the dialysate.
3. Use sterile technique when connecting the dialysis catheter to the Y tubing/dialysate.
4. Do not administer dialysate that is too cold. Do not warm dialysate by immersing in warm water. Use a warmer per dialysis center instructions.
5. CAPD dwell times generally are 3-6 hours during the day and 8-12 hours at night.

Equipment and Supplies

1. Dialysate;
2. Warmer (per dialysis center instructions);
3. Medication(s);
4. Syringe (if applicable);
5. Personal protective equipment:
 - a. Face masks (3);
 - b. Sterile gloves (1);
 - c. Clean gloves (2); and
 - d. Gown (1).
6. Sterile drape;

continues on next page

7. IV pole;
8. Connective (Y) tubing with clamps;
9. Sterile drainage bag;
10. Sterile 4 x 4 gauze (6-8);
11. Povidone-iodine sponges or solution;
12. Povidone-iodine ointment; and
13. Alcohol.

Steps in the Procedure

Assessment:

1. Introduce yourself to the resident.
2. Provide for the resident's privacy.
3. Explain the procedure.
4. Wash your hands.
5. Obtain the resident's baseline weight and vital signs.
6. Measure the abdominal girth.
7. Observe for signs and symptoms of fluid volume overload (hypervolemia) including, labored breathing, increased blood pressure, edema, and neck vein distension.
8. Observe for signs and symptoms of hypovolemia including poor skin turgor, tachycardia and hypotension.

Prepare Supplies and Equipment:

1. Wash your hands.
2. Put on a face mask.
3. Warm the dialysate solution, per dialysis provider's instructions.
4. Remove the dialysate bag from the warming device and remove the protective wrapper.
5. Check the dialysate bag for the following:
 - a. Cloudiness, precipitate, leaks.
 - b. Expiration date.
 - c. Solution and concentration.
6. Add medication(s) to dialysate.
 - a. Disinfect injection port with povidone-iodine solution.
 - b. Disinfect multi-dose vials with a 5-minute povidone-iodine soak.
 - c. Using sterile needle, draw up medication.
 - d. Inject medication into dialysate.
 - e. Rotate bag to mix.
 - f. Label with medication name, date, time and initials.
7. Insert the Y connector into the dialysate bag and hang the bag and tubing on the IV pole.
8. Open the clamp and prime the tubing. Close the clamp.
9. Place a povidone-iodine soaked gauze pad on the distal end of the Y connector. Cover the pad with a dry gauze pad and secure with tape.
10. Tear some tape to prepare for the dressing change.
11. Remove your face mask.

continues on next page

Create a Sterile Field:

1. Wash your hands.
2. Place resident in semi-Fowler's or high-Fowler's position.
3. Prepare a sterile field by placing a sterile drape on a dry surface near the resident.
4. Place the sterile container on the field and pour iodine solution into the container.
5. Drop 4 sterile gauze pads into the solution.
6. Drop the remaining (dry) gauze pads on the sterile field.
7. Loosen the cap on the alcohol container and place next to the sterile field.

Catheter Care and Site Observation:

1. Put a clean mask on yourself and the resident.
2. Put on clean gloves.
3. Remove the dressing from the peritoneal catheter and discard. Do not touch the catheter tip or the skin.
4. Inspect the catheter site and surrounding skin for the following:
 - a. Purulent drainage (if so, obtain a swab sample of the drainage);
 - b. Redness; and
 - c. Pain or tenderness.
5. If there are signs/symptoms of infection or the catheter is cracked or torn, contact the physician for further instructions.
6. Remove gloves and wash your hands.
7. Put on sterile gloves.
8. Wrap one iodine-soaked gauze pad around the catheter tip and place on sterile field. Leave in place for 5 minutes.
9. Clean the catheter site with another iodine-soaked pad. Move in concentric circles away from the insertion site. Repeat.
10. Place the second sterile drape under the catheter. Clean the catheter with another iodine-soaked gauze pad. Start at the base of the catheter and move outward, using a clean side of the pad for each stroke. Repeat.
11. Apply sterile dressing over the catheter insertion site.

Infuse Dialysate:

1. Remove gauze from the end of the catheter after 5-minute soak. Remove gauze from distal end of the Y connector.
2. Remove the cap from the catheter. Clean the open end of the catheter with iodine-soaked gauze.
3. Attach the catheter end to the Y connector. Make sure that the drain bag clamp is closed.
4. Open the clamp from the dialysate container and allow the solution to flow into the peritoneal cavity over a period of 5-10 minutes, or as prescribed. Close the clamp.
5. Fold the bag and tuck the bag, Y connector and catheter into the resident's clothing.
6. Remove gloves and wash your hands.

Drain Fluid from Peritoneal Cavity:

1. After the prescribed dwell time (3-6 hours during the day or 8-12 hours at night), unfold the bag and attach the drain bag to the Y connector.
2. Open the clamp to the drain bag and allow the fluid to drain into the bag.
3. Record the amount of drainage collected in the drain bag. Note the color and clarity of returned fluid, and the presence of mucus, blood or pus.
4. Notify the physician if there is a discrepancy between the fluid intake and output.

continues on next page

5. Weigh the resident, as ordered.
6. Repeat infusion/drainage steps, as prescribed.

Temporarily Disconnect the Peritoneal Dialysis System:

1. Wash hands.
2. Apply sterile gloves.
3. Clean the junction of the catheter and 6 inches of the Y connector with iodine-soaked gauze for at least 1 minute.
4. Disconnect the catheter from the connector and tubing.
5. Securely fasten sterile catheter cap to the catheter.
6. Discard bags and fluid per facility infection control policies.
7. Remove gloves and wash your hands.

Documentation

The following information should be recorded in the resident’s medical record:

1. Name, initials, and title of person performing the procedure.
2. The date and time infusion was started and stopped (fill time).
3. Amount of dialysate infused.
4. The time drain was started (dwell time).
5. The amount of dialysate that was drained.
6. The number of exchanges.
7. The resident’s weight before and after the procedure.
8. Medications added to the dialysate.
9. The condition of the catheter, insertion site and surrounding skin.
10. Signs and symptoms of complications and or infection.
11. How the resident tolerated the procedure.
12. Any physician or dialysis center notification and response.

Suprapubic Catheter Care

Level III

Purpose

The purpose of this procedure is to prevent skin irritation around the stoma site and to prevent infection of the resident's urinary tract.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Observe the resident's urine level for noticeable increases or decreases. If the level stays the same, or increases rapidly, report it to your supervisor.
2. Should the resident indicate that his or her bladder is full or that he or she needs to void, report it immediately to your supervisor.
3. Check the urine for unusual appearance (i.e., color, blood, etc.).
4. The urinary drainage bag must be held or positioned lower than the bladder at all times to prevent the urine in the tubing and drainage bag from flowing back into the urinary bladder.
5. Check the resident frequently to be sure the tubing is free of kinks.
6. Notify your supervisor immediately in the event of hemorrhage or if the catheter is pulled out.
7. Maintain an accurate record of the resident's daily output, if indicated.
8. Observe the resident for signs and symptoms of urinary tract infection and urinary retention. Report findings to your supervisor.
9. Empty the collection bag at least every eight (8) hours.

Equipment and Supplies

1. Wash basin;
2. Soap and water;
3. Washcloth;
4. Towel;
5. Bed protector;
6. Drainage sponge (if ordered by physician); and
7. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Assist the resident into the supine position.
4. Put on disposable gloves.
5. Place bed protector under resident.

continues on next page

6. Wash around the catheter site with soap and water. (Note: If the resident has a drainage sponge around the stoma site, remove the drainage sponge before washing with soap and water.) Wash the outer part of the catheter tube with soap and water.
7. Pour wash water down the commode. Flush the commode.
8. Discard soiled linen in designated container.
9. Discard disposable items into designated containers.
10. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
11. Inspect the stoma site and skin around the stoma for any redness or skin breakdown.
12. Check the urine for color and clarity. Check the tubing for any kinks.
13. Reposition the bed covers. Make the resident comfortable.
14. Place the call light within easy reach of the resident.
15. Clean wash basin and return to designated storage area.
16. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
17. Wash and dry your hands thoroughly.
18. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. Results of skin assessment around the stoma site.
7. Character of urine such as color (straw-colored, dark, or red), clarity (cloudy, solid particles, or blood), and odor.
8. Any problems or complaints made by the resident during the procedure.
9. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities in the skin assessment or the character of urine.
3. Report other information in accordance with facility policy and professional standards of practice

Suprapubic Catheter Replacement

Level III

Purpose

The purpose of this procedure is to relieve the retention of urine in the bladder in a resident who requires a permanent or long term catheter.

Preparation

1. Verify that there is a physician's order for this procedure.
2. Review the resident's care plan to assess for any special needs of the resident.
3. Assemble the equipment and supplies as needed.

General Guidelines

1. Determine if the resident is on intake or output before discarding urine.
2. Check urine for unusual appearance. Record findings.
3. Maintain a daily record of resident's daily fluid intake and output, as indicated.
4. Verify latex versus silicone composition of catheter.
5. Only replace tubes containing balloons which can be deflated.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Catheter insertion tray with drainage bag;
2. Catheter of proper size and composition (ordered by the physician);
3. Specimen container (if ordered);
4. Cotton balls;
5. Antiseptic solution;
6. Sterile towels;
7. Sterile forceps;
8. Lubricant;
9. 10mL syringe without needle and a 10mL syringe prefilled with sterile water or saline; and
10. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on disposable gloves.
4. Remove any dressings or release tube from drain tube attachment device.
5. Deflate Foley balloon with 10mL syringe and remove used tube. If resistance is met, stop and notify the physician. Discard used tube into designated container.
6. Remove gloves and discard into designated container. Wash and dry your hands thoroughly.

continues on next page

7. Open sterile catheter tray. Set up sterile field with the drapes supplied.
8. Put on sterile gloves.
9. Test catheter balloon by inserting sterile water or saline provided. Deflate the balloon.
10. Lubricate tip of replacement catheter with water-soluble lubricant provided.
11. Drainage bag may be attached to collect the urine.
12. Cleanse site three times with betadine cotton balls. Using a circular motion progress outward from the site.
13. Insert tube at a 90 degree angle with slight rotation. Expect tube to be inserted approximately 2-4 inches. If resistance is met, stop and notify physician.
14. Verification of placement will be made when urine begins to flow. When urine begins to flow, inflate the balloon with sterile water or saline that is provided.
15. Pull back on tube so that the balloon will rest against the bladder wall.
16. Stabilize tube with drain tube attachment device.
17. Discard all disposable items into designated containers.
18. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
19. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
20. Wash and dry your hands thoroughly.
21. Reposition the bed covers. Make the resident comfortable.
22. Place the call light within easy reach of the resident.
23. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The type of tube removed.
7. The balloon size, French size, and composition of replacement tube.
8. Method of stabilization.
9. Return of urine flow.
10. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician if resistance is met while replacing tube or if urine is cloudy, bloody, has a foul odor, etc.
3. Report other information in accordance with facility policy and professional standards of practice.

Ureterostomy Care

Level III

Purpose

The purposes of this procedure are to promote cleanliness and to protect peristomal skin from irritation, breakdown, and infection.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Determine if the resident is on intake or output before discarding urine.
2. Check urine for unusual appearance and record findings.
3. Maintain a daily record of resident's daily fluid intake and output, as indicated.
4. Inspect the condition of the skin around the stoma for any irritation or breakdown. If present, notify the supervisor and physician immediately.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Soap and water;
2. Wash basin;
3. Barrier paste;
4. Skin sealant;
5. Gauze pads;
6. Pouch;
7. Bedside urinary drainage bag; and
8. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Fill the wash basin one-half (1/2) full of warm water. Place the wash basin on the bedside stand within easy reach.
4. If the resident's physical or medical condition permits, assist the resident into the semi-fowler's position. Refer to the resident's plan of care and/or request information from the Nurse Supervisor regarding safe positioning for the resident.
5. Put on disposable gloves.
6. Remove soiled appliance being careful not to cause unnecessary trauma to peristomal skin. Immediately place a gauze pad over the stomal opening. If stents are present, do not pull. Place gauze pads underneath tips.

continues on next page

7. Assess the condition of the skin around the stoma.
8. Gently cleanse the surrounding skin with warm water and soap using a washcloth or gauze pad. Pat skin dry with a clean towel.
9. Apply barrier paste as necessary. Apply skin sealant to skin surrounding stoma. Let dry 1-2 minutes. Insert the new appliance, being sure that it securely adheres to the skin to prevent leakage. (Note: If stents are present, attach the new appliance to the stents.)
10. Open the drain spout and attach to bedside urinary bag.
11. Pour the wash water down the commode. Flush the commode.
12. Discard all disposable items into designated containers.
13. Discard soiled linen into designated container.
14. Clean wash basin and return to designated storage area.
15. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
16. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
17. Wash and dry your hands thoroughly.
18. Reposition the bed covers. Make the resident comfortable.
19. Place the call light within easy reach of the resident.
20. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident's medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. The condition of the skin surrounding the stoma.
4. The type of appliance utilized.
5. All assessment data obtained during the procedure.
6. How the resident tolerated the procedure.
7. If the resident refused the procedure, the reason(s) why and the intervention taken.

Reporting

1. Notify the supervisor if the resident refuses the procedure.
2. Notify the physician of any abnormalities in the skin around the stoma.
3. Report other information in accordance with facility policy and professional standards of practice.

Urinary Leg Drainage Bags

Level III

Purpose

The purpose of this procedure is to provide guidelines to decrease the likelihood of nosocomial urinary tract infections associated with the intermittent use of leg drainage bags with Foley catheters.

Preparation

1. Review the resident's care plan to assess for any special needs of the resident.
2. Assemble the equipment and supplies as needed.

General Guidelines

1. Every attempt should be made to maintain a closed urinary drainage system.
2. Leg drainage bags should be used only after careful consideration and after a decision has been made that the benefits of use of the bag outweigh the potential increased risk of urinary tract infection. The resident should be informed that there is increased risk of infection when the integrity of the closed urinary drainage system is compromised.
3. A new sterile drainage bag should be used every time the regular straight drainage tubing is disconnected and the leg bag is used.
4. The regular straight drainage bag may be reconnected only if it appears that the integrity of the system has been maintained.
5. Aseptic technique must be used when handling urinary drainage systems.
6. Do not wash or disinfect leg bags in an attempt to reuse them.

Equipment and Supplies

The following equipment and supplies will be necessary when performing this procedure:

1. Alcohol wipe;
2. Measuring container;
3. Red bag or container; and
4. Personal protective equipment (e.g., gowns, gloves, mask, etc., as needed).

Steps in the Procedure

1. Place the clean equipment on the bedside stand or overbed table. Arrange the supplies so they can be easily reached.
2. Wash and dry your hands thoroughly.
3. Put on gloves.
4. Wipe the Foley catheter/drainage tubing junction with alcohol wipe before disconnecting.
5. Disconnect the catheter from the tubing. If the drainage system has a tamper-proof seal, the seal will have to be broken. (**Note:** If the system has been previously opened, remove the tape.)
6. Carefully remove sterile cover over connection tip on the urinary leg drainage bag.
7. Place the cover over the connection tip of the straight drainage bag.
8. Connect the Foley catheter with the urinary leg drainage bag. Anchor as directed.

continues on next page

9. Empty straight drainage bag and measure urine, as indicated. Keep the drainage bag in a safe place where it will not be mishandled. Continue to keep drainage bag beneath the drainage tubing to prevent contamination.
10. When the urinary leg drainage bag is no longer needed, wipe the catheter/drainage bag junction with alcohol wipe.
11. Wipe connection tip of straight drainage tubing with alcohol wipe. If there is reason to believe the integrity of the system has not been maintained, obtain a new drainage bag.
12. Reconnect system. Secure the junction with tape.
13. Measure urine in urinary leg drainage bag, as necessary.
14. Discard used urinary leg drainage bag into designated container.
15. Discard all disposable items into designated containers.
16. Remove gloves and discard in designated container. Wash and dry your hands thoroughly.
17. Clean the bedside stand and/or overbed table. Return the overbed table to its proper position.
18. Wash and dry your hands thoroughly.
19. Reposition the bed covers. Make the resident comfortable.
20. Place the call light within easy reach of the resident.
21. If the resident desires, return the door and curtains to the open position and if visitors are waiting, tell them that they may now enter the room.

Documentation

The following information should be recorded in the resident’s medical record:

1. The date and time the procedure was performed.
2. The name and title of the individual(s) who performed the procedure.
3. All assessment data obtained during the procedure.
4. How the resident tolerated the procedure.
5. If the resident refused the procedure, the reason(s) why and the intervention taken.
6. The signature and title of the person recording the data.

Reporting

1. Notify the supervisor if the resident refuses the procedure or if there is reason to believe that contamination has occurred.
2. Report other information in accordance with facility policy and professional standards of practice.

NURSING SERVICES

Policy and Procedure Manual for Long-Term Care

Index - Volumes I and II

Item # H50075

Using the Index

The following is a list of abbreviations and the names of the chapters to which they correspond in this manual.

Volume 1

AT	Admissions, Transfers and Discharges
AS	Assessments and Care Planning
DO	Documentation
FS	Food Services
IC	Infection Control
IV	Intravenous Therapy
MD	Medications
OR	Orders, Receiving and Transcribing
PC	Personal Care
PS	Personnel and Staffing
PM	Positioning and Moving
RR	Rehabilitative and Restorative Care
RD	Resident Rights and Dignity
RI	Resident Safety
SC	Specimen Collection

Volume 2

BH	Behavior, Mood and Cognition
CV	Cardiovascular Conditions
DB	Diabetic Care
EM	Emergency and First Aid
ED	End of Life Care
FA	Falls and Fall Risk
GA	Gastrointestinal Conditions
MA	Managing Infections
MS	Miscellaneous
MU	Musculoskeletal Conditions
NU	Nutrition and Hydration
PA	Pain Management
RP	Respiratory and Pulmonary Conditions
SW	Skin and Wound Management
UR	Urinary and Renal Conditions

To use the Index, locate the topic about which you need information.

Clinical Protocols/Policies/Procedures Example:

Advance Directives 10 (AT)

Information concerning the topic Advance Directives is located on page ten (10) in the chapter entitled *Admissions, Transfers and Discharges* (AT).

Appendices Example:

Complaint/Grievance Report (MP5414) ii (RD)

All documents included in chapter appendices are located only on the flash drive. In order to locate these documents according to subject, refer to listings in the appendices tables of content of their respective chapters.

For example; the form entitled Complaint/Grievance Report (MP5414) is a document located only on the flash drive and is listed on page ii of the Resident Rights and Dignity (RD) Table of Contents. To access the document, navigate to the document files on the flash drive: H50075-Flash Drive/Document Files/NSPM-Vol1/13-ResidentRights/ResidentRightsAppendix.

ACCESS TO ELECTRONIC HEALTH RECORD- REGULATORY AGENCIES	Effective Date	April 20, 2020
	Revision Dates	
	Departments Approving	Legal
	Departments Affected	All

Introduction and Background

HumanGood is committed to cooperating and providing regulators with requested information necessary to perform their role.

Policy

HumanGood will provide access to resident records to regulators as required by statute, regulation, or other applicable law.

The form of access will vary depending upon regulator need or request. This form may consist of:

- Printed copies of records
- Faxed copies of records
- On site access to paper documents
- On site access to HumanGood Electronic Health Record System hardware with appropriate login information
- Encrypted email
- Encrypted devices such as thumb drives or other hardware sent to regulator

HumanGood strives to maintain the safety of highly sensitive information under HIPAA guidelines, therefore, access by regulators to the medical record via the internet or on an unencrypted device will not be allowed.

If such access is required by regulation or statute, HumanGood IT department will assist in setting up a secure temporary connection protecting the data transmission.

Definitions

Regulator: individuals properly identified as working for a local, state or federal regulatory agency (such as CMS, Public Health, State Department of Health, State Department of Social Services) or other regulating bodies who by regulation, statute, or other applicable law are required to be given access to medical records in the course of their work conducting a survey or investigation.

Antibiotic Stewardship

Policy Statement

Antibiotics will be prescribed and administered to residents under the guidance of the facility's antibiotic stewardship program.

Policy Interpretation and Implementation

1. The purpose of our antibiotic stewardship program is to monitor the use of antibiotics in our residents.
2. Orientation, training and education of staff will emphasize the importance of antibiotic stewardship and will include how inappropriate use of antibiotics affects individual residents and the overall community.
3. Training and education will include emphasis on the relationship between antibiotic use and:
 - a. gastrointestinal disorders;
 - b. opportunistic infections (e.g., *C. difficile*, *Candida albicans*, etc.);
 - c. medication interactions; and
 - d. the evolution of drug-resistant pathogens.
4. If an antibiotic is indicated, prescribers will provide complete antibiotic orders including the following elements:
 - a. Drug name;
 - b. Dose;
 - c. Frequency of administration;
 - d. Duration of treatment:
 - (1) Start and stop date; or
 - (2) Number of days of therapy;
 - e. Route of administration; and
 - f. Indications for use.
5. When a resident is admitted from an emergency department, acute care facility, or other care facility, the admitting nurse will review discharge and transfer paperwork for current antibiotic/anti-infective orders.
6. Discharge or transfer medical records must include all of the above drug and dosing elements.
7. When a resident is discharged home, the nurse will review complete antibiotic orders with the resident, including:
 - a. the reason for the antibiotic;
 - b. how to take the antibiotic, including all dosing essentials;
 - c. possible side effects;
 - d. the importance of taking the antibiotic until the prescribed end-date;
 - e. the date his/her next doctor's appointment should be scheduled; and
 - f. drug monograph as provided by the dispensing pharmacy or other approved drug information resource, when discharging the resident with the antibiotic.
8. When a nurse calls a physician/prescriber to communicate a suspected infection, he or she will have the following information available:
 - a. Signs and symptoms;

continues on next page

- b. When symptoms were first observed;
 - c. Resident’s hydration status;
 - d. Current medication list;
 - e. Allergy information;
 - f. Infection type;
 - g. Any orders for warfarin and results of last INR;
 - h. Last creatinine clearance or serum creatinine, if available; and
 - i. Time of the last antibiotic dose.
9. When an interacting antibiotic is to be administered concomitantly with warfarin, an INR will be ordered within three days. When results are returned:
 - a. INR will be communicated to prescriber as soon as received;
 - b. the appropriate dose of warfarin will be confirmed;
 - c. any changes in warfarin orders will be communicated to the pharmacy; and
 - d. the next scheduled INR will be ordered.
 10. When antibiotics are prescribed over the phone, the primary care practitioner will assess the resident within 72 hours of the telephone order.
 11. When a culture and sensitivity (C&S) is ordered lab results and the current clinical situation will be communicated to the prescriber as soon as available to determine if antibiotic therapy should be started, continued, modified, or discontinued.
 12. Before a nurse removes an antibiotic from the facility emergency supply of medication, he or she will check for the right drug, right strength, allergy information and use of warfarin, along with the following:
 - a. The nurse will contact the pharmacist if not familiar with the antibiotic dose or drug-drug interactions;
 - b. The pharmacy removal slip for the dose(s) removed will be completed; and
 - c. As soon as clinically appropriate, the prescriber will be asked to review converting parenteral antibiotics to an oral formulation.

Antibiotic Stewardship – Orders for Antibiotics

Antibiotics will be prescribed and administered to residents under the guidance of the facility's antibiotic stewardship program and in conjunction with the facility's general policy for medication utilization and prescribing.

Policy Interpretation and Implementation

1. Prior to calling a physician/prescriber to communicate a suspected infection, the nurse will obtain and have the following information available:
 - a. Clinical signs and symptoms of suspected infection (based on approved definitions of infection);
 - b. A history of the present illness;
 - c. Resident's hydration status;
 - d. Current medication list;
 - e. Allergy information;
 - f. Any orders for warfarin and results of last INR;
 - g. Last creatinine clearance or serum creatinine, if available; and
 - h. Time of the last antibiotic dose.
2. If an antibiotic is indicated, prescribers will provide complete antibiotic orders including the following elements:
 - a. Drug name;
 - b. Dose;
 - c. Frequency of administration;
 - d. Duration of treatment:
 - (1) Start and stop date; or
 - (2) Number of days of therapy;
 - e. Route of administration; and
 - f. Indications for use.
3. Appropriate indications for use of antibiotics include:
 - a. criteria met for clinical definition of active infection or suspected sepsis; and
 - b. pathogen susceptibility, based on culture and sensitivity, to antimicrobial (or therapy begun while culture is pending).
4. Empirical use of an antibiotic based on clinical criteria of suspected sepsis may be appropriate. The staff and practitioner will document the specific criteria that support the suspicion in the resident's clinical record.
5. If a resident is admitted from an emergency department, acute care facility, or other care facility, the admitting nurse will review discharge and transfer paperwork for current antibiotic/anti-infective orders. Discharge or transfer medical records must include all of the above drug and dosing elements.
6. When antibiotics are prescribed over the phone, the primary care practitioner will assess the resident within 72 hours of the telephone order.

continues on next page

7. When a culture and sensitivity (C&S) is ordered, it will be completed, and:
 - a. lab results and the current clinical situation will be communicated to the prescriber as soon as available to determine if antibiotic therapy should be started, continued, modified, or discontinued.
8. As soon as clinically appropriate, the prescriber will be asked to review converting parenteral antibiotics to an oral formulation.
9. When a resident is discharged home, the nurse will review complete antibiotic orders with the resident, including:
 - a. the reason for the antibiotic;
 - b. how to take the antibiotic, including all dosing essentials;
 - c. possible side effects;
 - d. the importance of taking the antibiotic until the prescribed end-date;
 - e. the date their next doctor’s appointment should be scheduled; and
 - f. drug monograph as provided by the dispensing pharmacy or other approved drug information resource, when discharging the resident with the antibiotic.
10. Before a nurse removes an antibiotic from the emergency supply of medication, he or she will check for the right drug, right strength, allergy information and use of warfarin, along with the following:
 - a. The nurse will contact the pharmacist if not familiar with the antibiotic dose or drug-drug interactions;
 - b. The pharmacy removal slip for the dose(s) removed will be completed; and
 - c. The use will be reported to the infection preventionist.

Antibiotic Stewardship – Review and Surveillance of Antibiotic Use and Outcomes

Policy Statement

Antibiotic usage and outcome data will be collected and documented using a facility-approved antibiotic surveillance tracking form. The data will be used to guide decisions for improvement of individual resident antibiotic prescribing practices and facility-wide antibiotic stewardship.

Policy Interpretation and Implementation

1. As part of the facility antibiotic stewardship program, all clinical infections treated with antibiotics will undergo review by the infection preventionist, or designee.
2. The IP, or designee, will review antibiotic utilization as part of the antibiotic stewardship program and identify specific situations that are not consistent with the appropriate use of antibiotics.
 - a. Therapy may require further review and possible changes if:
 - (1) the organism is not susceptible to antibiotic chosen;
 - (2) the organism is susceptible to narrower spectrum antibiotic;
 - (3) therapy was ordered for prolonged surgical prophylaxis; or
 - (4) therapy was started awaiting culture, but culture results and clinical findings do not indicate continued need for antibiotics.
3. At the conclusion of the review, the provider will be notified of the review findings.
4. All resident antibiotic regimens will be documented on the facility-approved antibiotic surveillance tracking form. The information gathered will include:
 - a. resident name and medical record number;
 - b. unit and room number;
 - c. date symptoms appeared;
 - d. name of antibiotic (see approved surveillance list);
 - e. start date of antibiotic;
 - f. pathogen identified (see approved surveillance list);
 - g. site of infection;
 - h. date of culture;
 - i. stop date;
 - j. total days of therapy;
 - k. outcome; and
 - l. adverse events.

Antibiotic Stewardship – Staff and Clinician Training and Roles

The facility will educate and train staff and practitioners about the facility antibiotic stewardship program, including appropriate prescribing, monitoring, and surveillance of antibiotic use and outcomes.

Policy Interpretation and Implementation

Nursing Assistants

1. Nursing assistants and other unlicensed staff will be trained and in-serviced on:
 - a. recognizing signs and symptoms of infection that should be reported to the nurse; and
 - b. how to report resident changes of condition to the nurse (e.g., using tools such as INTERACT Stop and Watch Early Warning Tool).

Nursing and Direct Care Licensed Staff

1. Nurses will receive initial orientation and ongoing training on:
 - a. the facility's antibiotic stewardship program, including the need for judicious use of antibiotics;
 - b. common clinical conditions and associated pathogens treated at this facility;
 - c. how to utilize the standardized assessment and communication tool for residents suspected of having an infection;
 - d. how to access the list of antimicrobial agents available through the pharmacy formulary;
 - e. how to communicate with residents and family about the need for appropriate use of antibiotics;
 - f. specific information that should be reported to the physician or provider upon identifying signs and symptoms of possible infection; and
 - g. specific information that should be obtained when an order for an antibiotic is received.

Director of Nursing (DON) and Infection Preventionist (IP)

1. Administrative and management personnel with clinical oversight responsibilities will receive initial orientation and ongoing training on:
 - a. the facility's antibiotic stewardship program;
 - b. the rationale for judicious use of antibiotics;
 - c. common clinical conditions and associated pathogens treated at this facility;
 - d. how to access the current facility antibiogram, if applicable;
 - e. how to access the list of antimicrobial agents available through the pharmacy formulary;
 - f. how to use surveillance tools to monitor infections rates, antibiotic usage patterns and outcomes;
 - g. how to report notifiable infections when applicable;
 - h. how and when to gather data to present to the infection prevention and control committee (IPCC) for scheduled meetings; and
 - i. individual roles and responsibilities in maintaining antibiotic stewardship.
2. The DON will monitor individual resident antibiotic regimens, including:
 - a. reviewing clinical documentation supporting antibiotic orders; and
 - b. compliance with start/stop dates and/or days of therapy.

continues on next page

3. The IP will audit and the DON will provide feedback to providers on antibiotic prescribing practices.
4. The IP will monitor over time and report to the IPCC:
 - a. measures of antibiotic use (new antibiotic starts/1000 resident days AND days of therapy/1000 resident days);
 - b. antibiotic susceptibility patterns (antibiogram data for specific timeframe); and
 - c. negative outcomes or events related to antibiotic use, for example:
 - (1) *C. difficile* infections;
 - (2) adverse drug events; and
 - (3) antibiotic resistance rates.
5. The IP will obtain, and the DON will provide to healthcare practitioners, educational resources and materials about antibiotic resistance and opportunities for improved antibiotic use.
6. The IP and DON will participate in IPCC meetings on a regular basis.

Consultant Pharmacist

1. During the drug regimen review, the consultant pharmacist will identify, and flag, orders for antibiotics that are not consistent with antibiotic stewardship practices.
2. The CP will review the microbiology culture data (antibiogram) and share with the providers to help guide antibiotic selection.
3. The CP will provide the facility with the most current medication formulary.
4. The CP will participate in IPCC meetings on a regular basis.

TABLE 1

Considerations for Inclusion of Infections in Long-Term Care Facilities (LTCFs) into Facility Infection Surveillance Programs

Points to consider	Infections	Comments
A. Infections that should be included in routine surveillance		
1. Evidence of transmissibility in a healthcare setting	Viral respiratory tract infections, viral gastroenteritis, and viral conjunctivitis	Associated with outbreaks among residents and healthcare personnel in LTCFs.
2. Processes available to prevent acquisition of infection		
3. Clinically significant cause of morbidity or mortality	Pneumonia, urinary tract infection, gastrointestinal tract infections including <i>Clostridium difficile</i> , and skin and soft tissue infections	Associated with hospitalization and functional decline in LTCF residents.
4. Specific pathogens causing serious outbreaks	Any invasive group A <i>Streptococcus</i> infection, acute viral hepatitis, norovirus, scabies, influenza	A single laboratory-confirmed case should prompt further investigation.
B. Infections that could be considered in surveillance		
1. Infections with limited transmissibility in a healthcare setting	Ear and sinus infections, fungal oral and skin infections, and herpetic skin infections	Associated with underlying comorbid conditions and reactivation of endogenous infection.
2. Infections with limited preventability		
C. Infections for which other accepted definitions should be applied in LTCF surveillance (may apply to only specific at-risk residents)		
	Surgical site infections, central-line-associated bloodstream infections, and ventilator-associated pneumonia	LTCF-specific definitions were not developed. Refer to the National Healthcare Safety Network’s criteria (http://www.cdc.gov/nhsn/TOC_PSCManual.html).

FOOD BROUGHT IN BY FAMILY/VISITORS	Effective Date	11/28/16
	Revision Dates	
	Departments Approving	
	Departments Affected	Health Centers

Introduction and Background: The 2015 revised Requirements of Participation from CMS requires that skilled nursing facility participants in Medicare follow a process to control food stuffs brought in by family and visitors when residents are on special diets.

Policy:

To the extent that doing so does not conflict with the physician’s diet orders, liberalized diets will be permitted and family/visitors may bring food stuffs to a resident. Family members are advised on admission that they are to inform nursing staff of their desire to bring foods into the facility and, if the diet ordered by the physician is not a routine, general diet, or if the resident has a swallowing disorder, the family/visitor are advised that they may not bring food into the Health Center for the resident.

Procedure:

1. As soon as practicable upon admission, the Health Center dietitian will counsel a new resident about any dietary restrictions and whether under their special diet plan, food may be brought in for them. This discussion will be documented in the resident record.
2. When a special diet is ordered but family/visitors desire to bring food in to the resident, a licensed nurse will request physician consideration for liberalizing the diet.
3. Non-perishable foods retained in the residents’ rooms must be stored in re-sealable containers with tight-fitting lids. Intact fresh fruit may be stored without a lid.
4. Perishable foods are to be stored in re-sealable containers with tightly fitting lids in the unit refrigerator. Containers will be labeled with the resident’s name, the item and the “use by” date.
5. The function of daily food checks for resident rooms and the unit refrigerator, and the refrigerator internal temperature, is assigned daily to a nursing assistant.
6. Any food item that shows obvious signs of mold growth, foul odor, past due package expiration dates will be discarded during this daily check.
7. Foods that present a potential choking hazard for residents with impaired cognitive function or swallowing difficulty will be taken from the resident and returned to the family member or visitor.

8. Home-prepared and home-preserved foods are permitted if brought by family or visitors for individual residents. Such foods may not be shared or distributed to other residents.
9. Potentially hazardous foods that are left in a resident room for longer than two (2) hours without a source of heat or refrigeration will be discarded by the assigned nursing assistant.

ANTIBIOTIC STEWARDSHIP PROGRAM

2022-2023

BACKGROUND

Although antibiotics are powerful drugs that have had great success in treating serious infections, decades of overprescribing and misuse have resulted in bacteria that are increasingly resistant to these potent drugs, creating a growing threat of new superbugs that are difficult, and sometimes even impossible, to treat. Recent clinical studies indicate that 30% - 50% of antibiotics prescribed in health care settings are either unnecessary or inappropriate. Overuse and misuse of these drugs has resulted in an increase in *Clostridium difficile* (C.diff) infections, diarrhea, gastroenteritis, and general medication adverse effects. Overuse and misuse include:

- Use of antibiotics when not needed.
- Continued treatment when no longer necessary.
- Use of broad-spectrum agents to treat very susceptible bacteria.
- Prescribing the wrong antibiotic to treat a particular bacteria.

DRUG RESISTANT BACTERIA

The imminent problem however, is the rise of antibiotic resistant bacteria. According to the Agency for Healthcare Research and Quality, antibiotics are one of the most commonly prescribed medications in nursing homes and overuse of antibiotics is recognized as a serious problem. Overexposure to antibiotics allows drug-resistant strains of bacteria and health care-associated infections, such as *Clostridium difficile* infections, to emerge in the nursing home. When this occurs, it is harder to treat infections, and residents may develop complications. The result is increased resident mortality, hospitalizations, and costs. Between 25 percent and 75 percent of antibiotics prescribed in nursing homes are unnecessary. Because it can be challenging to determine when a resident actually has an infection, prescribing clinicians—doctors, nurse practitioners, and physician assistants—are likely to overuse antibiotics. At the same time, nursing home residents are at high risk for developing complications associated with antibiotic use.

The benefits of antibiotic stewardship include improved outcomes for patients, reduced adverse events including *Clostridium difficile* infection (CDI), and improvement in rates of antibiotic susceptibilities to targeted antibiotics,

DEFINITION

“Antibiotic Stewardship” refers to a set of commitments and actions designed to optimize the treatment of infections while reducing the adverse events associated with antibiotic use. This can be accomplished through improving antibiotic prescribing, administration, and management practices thus reducing

inappropriate use to ensure that residents receive the right antibiotic for the right indication, dose, and duration.

HUMANGOOD COMMITMENT TO QUALITY

The HumanGood organization is committed to ensuring consistent high-quality care through innovation and identifying and utilizing best practices. The goal of optimizing outcomes through the appropriate use and monitoring of antibiotics is part of this commitment.

PROGRAM SCOPE AND ACCOUNTABILITY

The HumanGood Board of Directors has been advised of the implementation of this Program and has issued a resolution in support so that over time, this program is maintained, monitored, and revised as necessary. In addition, the President and CEO has made a commitment to dedicating the necessary resources to support the Program, including personnel to monitor antibiotic use and outcomes at each Health Center. The Vice President, Health Care and Quality, is responsible and accountable to assure the Health Centers implement and maintain this Plan.

ROLES AND RESPONSIBILITIES:

The Director of Nursing is responsible and accountable to maintain the Program, and sets practice standards for assessing, monitoring and communicating elements to team members. The director of nursing establishes process measures to evaluate the program's impact on skilled and custodial residents, and assigns tasks to other team members designed to track antibiotic use and outcomes. The Director of Nursing is the liaison between the Health Centers and our pharmacy consultants. The Director also provides liaison services to the Medical Director and attending physicians.

The Medical Director has primary responsibility for assuring that residents receive only those antibiotics clearly indicated by laboratory data of the type, dosage, frequency, and duration indicated by the laboratory results belong to the Medical Director, who works in concert with the resident's attending physician and the contract pharmacy consultant in order to make such determinations. In any discussion between these parties, individual variation in residents with infection and the clinical judgment and expertise of the attending physician will be considered.

Facility Administrators and Directors of Nursing provide the time necessary for licensed nurse training and education on antibiotic expertise and stewardship, and the financial support to enable ASP team leaders the time to perform the functions of the Program.

The Infection Preventionist (IP) tracks use of antibiotics in the Health Center, monitors for the development of resistance, and ensures reporting to the attending physician, and /or medical director if resistance is noted in laboratory results. The IP also reports program outcomes regularly to the IDT team and QAPI committee. IP also provides clinical surveillance of team

members use of appropriate infection control techniques, and works with the Director of Staff Education to provide information, training and needed re-training about current infections and procedures utilized for appropriate care. (See appendix B-Antibiotic Stewardship Policy- Review and Surveillance, Appendix C)

The Director of Staff Education is responsible and accountable for arranging appropriate team member education about their role in this Program, current infection prevention guidelines and changes to infection prevention policy. (See Appendix B-Antibiotic Stewardship Policy-Staff and Clinician Training and Roles)

Consulting Pharmacist will be engaged in QAPI activities such as medication regime review and providing reports on antibiotic use. (See Appendix B-Antibiotic Stewardship Policy-Staff and Clinician Training and Roles)

Consulting Laboratory Will provide alerts on organisms, and an overall profile of antimicrobial susceptibility from those organisms isolated in cultures (antibiogram report) and infection statistics to the QAPI/ Infection Prevention and Control committee.

PROGRAM REVISIONS

This Antibiotic Stewardship Programs will continue to evolve in sophistication, and include actions, measurements, and clinical guidelines as they develop in the long-term care industry, infectious disease experts and the CDC. Health centers will, as appropriate, use evidence-based clinical guidelines for diagnostic testing and treatment of common infections in the elderly.

PROGRAM PURPOSE AND PRIMARY GOAL

The purpose of the antibiotic stewardship program in the Health Center is to optimize treatment of infections and antibiotic use by assisting attending physicians to provide the residents under their direct care with the right antibiotic, at the right time, at the right dose, and for the right duration to reduce adverse events associated with antibiotics and improve patient outcomes. Our primary goal is improved clinical outcomes, reduced adverse events including Clostridium difficile infection (CDI), and improvement in rates of antibiotic susceptibilities to targeted antibiotics. The reduction of CDI, VRSA, and MRSA infections in our skilled nursing residents is a high priority for this program. the program represents a three-pronged approach to minimizing antibiotic resistance:

- Control the development of infections in our Health Centers.
- Manage the utilization of antibiotic therapy in our Health Centers to avoid overutilization and misuse of antibiotics.
- Perform environmental oversight to reduce the number and type of pathogens in our Health Centers.

PROGRAM OBJECTIVES

Focusing on the 5 “Ds” of antimicrobial prescribing which are 1) diagnosis, 2) drug selection, 3) dosage, 4) de-escalation, and 5) duration, each Health Center will:

- Promote a culture of optimal antibiotic use for bacteriuria, with clinical decision support to ensure guidelines and recommended interventions are easily accessible.
- Embed and use clinical decision support tools in the electronic health record
- Incorporate stewardship efforts into the Health Center infection control activities to include identification of residents with drug resistant organisms such as MRSA, VRSA, and C.diff upon admission, and tracking of resident days of therapy, stop dates, and outcomes.
- Prevent the transmission of drug resistant organisms through cross-contamination.
- Identify residents who do or do not meet criteria for antibiotic use once lab results are available.
- Administer ordered antibiotics at the dose ordered, in the amount ordered, and within 30 minutes of the time that they are ordered to be given.
- Assure that each antibiotic order contains a “stop” order and that this date is transcribed to the Medication Administration Record.
- Monitor resident outcomes and assure medical peer review if an outcome is suboptimal.
- Regardless of the presence of a stop order, communicate with the provider when an antibiotic is no longer necessary as indicated by laboratory results;
